By way of explanation for the areas of deficiency the Agent advised that, while contractors pouring concrete slabs are directed to do so based on Code thickness requirements, site conditions are sometimes such that slight variations may occur. He explained that workers walking on the stone may create minor indentations or leak-throughs in some areas may also occur. These conditions, he argued, are normal variations in the construction standards. He stated that the rights of the homeowner in this regard are protected by the Ontario New Home Warranty Program and he emphasized that, in the subject dwelling, there was no issue as to the quality of the concrete poured. No cracking had occurred and it was only as a result of core sampling that it was discovered that there was any deficiency.

In respect to the quality of the concrete used in the construction of the floor slab and to demonstrate that an equivalent level of performance would be achieved, the Agent advised that the compressive strength of the concrete exceeded the Code requirement of 25 Mpa. At the request of the Commission, further testing by a professional engineer found the compressive strength to range from 36.5 Mpa to 38.1 Mpa. The Agent further submitted that the average length of the core slabs obtained by both the representative of the homeowner and the testing firm contracted by the Applicant surpassed the 75 mm minimum.

In summation, the Agent submitted that when considering all factors there was, in his opinion, a strong argument in support of a ruling for sufficiency of compliance. He suggested that, while tolerances in the standards of construction in this respect are not presently outlined in the OBC, the latest version of the CSA standard for slab on grade does include such allowances. He further emphasized that the engineering analysis of the concrete illustrate that the anticipated loads will be supported by the slab as constructed.

6. Respondent's Position

The Respondent submitted that the prescriptive requirements contained in Part 9 of the Code dictate that the concrete floor slab be a minimum of 75 mm thick. He suggested that this does not preclude the slab from being poured so that it is thicker than 75 mm, however, it is not acceptable fo the slab to fall short of this requirement. He further stated that there is nothing in the Code which would support consideration of the average thickness, as suggested by the Agent for the Applicant. This could create situations where the slab could be quite thin in areas and thicker in other. Moreover, in respect to any inclusion of tolerances in the OBC by way of a Code amendment, the Respondent suggested that there would also likely be an associated increase in the minimum thickness requirement.

In respect to the Applicant's argument that the strength of the concrete compensates for the deficiency in thickness, the Respondent stated that, for him to consider acceptance of this argument, a complete structural report conducted under Part 4 of the Building Code would be required. He suggested that "(a)ny comprehensive report must take into account the compaction of the ground under the floor slab, which in this case has not been substantiated. Further, the ground under the floor slab in houses is often disturbed and not usually compacted and a certain thickness of concrete is required to span any soft spots that may be present. For this reason the Building Code has mandated a minimum thickness of 3 inches." The minimum strength requirement, he submitted, is independent from the thickness requirement and should not be used to compensate for a deficiency in this regard.

In summation, the Respondent stated that the Code requirement was clear in respect to the minimum thickness for concrete slabs. He argued that this was not a matter open to interpretation and that the samples taken from the subject house demonstrate that the minimum requirement has not been met.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-constructed basement concrete floor slab which varies in thickness from 64 mm to 89 mm provides, sufficiency of compliance with Article 9.16.4.4. of the Ontario Building Code at 49 Pinemeadow Drive, Vaughan, Ontario.

8. Reasons

i) The results of an independently conducted analysis, as requested by the Building Code Commission and performed by a professional engineer, concluded that the compressive strength of the three separate core samples ranged from 36.5 Mpa to 38.1 Mpa, exceeding the requirement of 25 Mpa stipulated in Article 9.16.4.2.

ii) The core samples that were analyzed in this test were obtained by an independent testing agency.

iii) The length of the majority of the core samples taken from the floor slab equalled or exceeded the minimum thickness requirement and, furthermore, the average thickness of the samples was greater than the 75 mm minimum established by the Code.

DATE OF HEARING	November 21, 2002
DATE OF RULING	November 21, 2002
APPEARANCES	David Connelly Dacon Management Services Orleans, Ontario **Agent for the Applicant**

Philip Gerrard Chief Building Official Township of North Grenville **The Respondent**	J. Peter Vice Barristers & Solicitors Vice & Hunter **Solicitor for the Respondent**

RULING

1. The Applicant

Paul and Linda Clement, property owners, have received an Order to Remedy Unsafe Building under the *Building Code Act*, S.O. 1992, c. 23, as amended, pertaining to certain alleged deficiencies including the existing dead-end corridor configuration at 101 Joseph Street, Township of North Grenville, Ontario.

2. Description of Construction

The Applicant is the owner of a two storey apartment building constructed in 1985. The structure has a building area of 967 m^2, is comprised of a combination of noncombustible and combustible construction and is equipped with a fire alarm system. It has a Group C major occupancy classification and also incorporates a storage garage, classified as an F3 occupancy.

The item specific to this dispute is the length of the existing dead-end corridors on the first and second floors. The building is essentially rectangular in shape with the entrance situated approximately at the mid-point of the structure. The stairs and elevators serving the second floor are also situated in the middle of the building with a single public corridor extending in both directions from this central area. As a result, on both floors the corridors measure approximately 13.7 m and terminate at a dead-end. No alternate exit is provided at or near the ends of these corridors, however, the ground floor units each have an exit directly to the exterior.

Occupancy permits were issued for this building at the time of construction in 1985, however upon recent review by the municipality and discovery of this situation, an unsafe order was issued. In response to this order the Applicant is proposing to install 45 minute rated doors and frames in one hour rated partitions to subdivide the existing corridors. The partitions would run from floor level to the underside of the existing ceiling. The doors are proposed to be equipped with accessible egress latching hardware and automatic closing devices.

The aim of this proposal is to shorten the dead-end portion of the corridor running from the access to exit at the mid-point of the building to the entrance of the partitions. In addition, as a result of the proposed partitions, semi-private "vestibule" areas will be created at the ends of the existing corridors. The Applicant is proposing to pressurize these vestibules and protect the pressurization system by one hour rated construction. In addition, an exit light and a smoke detector will be installed in each vestibule and the ceiling structures above the vestibules will be reinforced to resist collapse.

Although the Applicant is prepared to construct these vestibules on both the first and second floors in response to the unsafe order, it is argued that because each dwelling unit on the ground floor has its own exit to the exterior, only the second storey would need to altered to address any "unsafe" situation.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed compensating construction offered in a 17 year old building where the length of the existing dead-end corridors exceeds the permitted maximum will provide sufficiency of compliance with Clause 3.3.4.4.(1)(a) of the 1983 Ontario Building Code (OBC) when considering Sentence 11.4.1.1.(1) and Article 11.5.2.1. of the current OBC.

Clause 3.3.4.4.(1)(a) mandates that dead-end corridors are not to exceed 6 m in length. The corridors on both the first and second floor were constructed in 1985 and measure approximately 13.7 m in length, terminating at a dead-end where no second and separate means of egress is provided. An occupancy permit was issued by the municipality at the time of construction and, until recently, no issue with respect to this existing situation had been raised. Upon recent inspection, the deficiency was noted and an Order to remedy the perceived unsafe situation was issued. As a result of this Order, as described above, the Applicant has proposed to compartmentalize the existing hallways to create shorter dead-end corridors measuring approximately 6 m in both directions from the point of access to exit.

In respect to the renovation of an existing building Sentence 11.4.1.1.(1) requires that the performance of the building after construction shall not be less than the performance level prior to construction. Furthermore, when considering alteration of an existing building, Article 11.5.2.1. permits the use of alternative measures where the Chief Building Official (CBO) (or alternatively the Building Code Commission under appeal) is satisfied that compliance with other parts of the code may be impractical because of construction difficulties or may be detrimental to the preservation of a heritage structure. Moreover, the CBO must be satisfied that the performance level of the building after use of the alternative measures shall not be less than the performance level of the building prior to construction.

As this is an existing building, falling under the purview of Part 11 of the Code, the Applicant has proposed the use of alternative measures to address the dead-end corridor issue identified in the Order to Remedy Unsafe Building issued by the municipality. The Applicant's position is that the proposed construction will not reduce the performance level of the existing building and that, to require strict compliance with the prescriptive requirements of the 1983 OBC is not practical because of the construction difficulties and cost involved.

4. Provisions of the Ontario Building Code

1983 Ontario Building Code, O.Reg. 583/83

3.3.4.4.(1) Except for corridors served by a single *exit* as described in Sentence 3.3.4.3.(5), a dead-end public corridor is permitted in a *residential occupancy* where

(a) it does not exceed 6 m in the distance of travel from the most remote point of the dead-end portion to a point where it is possible to go in opposite directions to each of 2 separate exits, and

1997 Ontario Building Code, O.Reg. 403/97

11.4.1.1. Performance Level

(1) The *performance level* of a *building* after *construction* shall not be less than the *performance level* of the *building* prior to *construction*.

11.5.2.1. Alternative Measures

(1) An *alternative measure* may be utilized where the *chief building official* is satisfied that

(a) compliance with the requirement of Part 3, 4, 5, 6, 7, 8 or 9 of the Code or with the *compliance alternative*, as the case may be, is impracticable because

(i) of structural or *construction* difficulties, or

(ii) it is detrimental to the preservation of a *heritage building*, and

(b) the *performance level* of the *building* after the use of the *alternative measure* shall not be less than the *performance level* of the *building* prior to *construction*.

5. Applicant's Position

The Agent for the Applicant provided the Commission with some background on the subject building, advising that it was constructed in 1985 and occupied since that time as rental accommodation. He submitted that permits had been obtained by the original permit applicant and when his client purchased the property they were advised that there were no outstanding work orders that would have to be addressed. It was not until his client contemplated converting the building into condominium units that any concern was raised. This is because when considering the conversion, the Applicant requested an inspection from the municipality and it was then that a number of deficiencies were noted. Shortly after the inspection an Order to Remedy Unsafe Building was issued outlining a number of Code violations. The Agent emphasized however, that no new construction was being proposed for the building. They were simply investigating the possibility of converting the rental units to condominium ownership. The Agent questioned the validity of the Order but advised the Commission that steps had been taken to remedy many of the items identified by the municipality as being of concern.

Notwithstanding their perception that errors have been committed by the municipality in relation to the issuance of the Order to Remedy Unsafe Building and any deficiencies with the order itself, the Applicants have prepared a proposal in an attempt to make the building safer. To address the safety issues associated with the dead-end corridor situation they are proposing to compartmentalize the areas, effectively creating shorter, more Code compliant, dead-end corridor portions and semi-private vestibules beyond the proposed partitions. Furthermore, to manage smoke movement in this area they are proposing to pressurize the vestibule areas that will be created. By doing so, the Agent submitted, the existing situation will be improved and sufficiency of compliance with the provisions of the Code will be achieved.

When questioned by the Respondent as to whether the proposed construction would provide an equal level of safety as would strict compliance with the Code requirements, the Agent acknowledged that it would not be equivalent. He emphasized, however, that this was an existing building for which building and occupancy permits had been obtained. He acknowledge the options for compliance suggested by the municipality but submitted that the proposed compensation being offered here, would be an improvement to the existing situation and would not reduce the performance level of the building. This is not a case of new construction, he argued, simply a renovation of an existing building in response to an Order that was arguably deficient. He maintained that to comply with 1983 Code requirements, as suggested by the municipality, would be both onerous and impractical at this point in time, causing disruption to tenants of this fully occupied building.

In support of the proposed remedy the Agent advised the Commission that "the existing structural elements of the building, excepting the roof trusses, are non-combustible, and therefore add no fuel to a fire. The Code however, allows the entire structure to be of combustible construction." As a second point the Agent submitted that "all corridor walls, exit stair walls, exterior bearing walls and demising walls include 8" concrete block, and can safely be assumed as having a 1 hour fire resistance rating. In each respect, then these walls exceed the Code, which permits 45 minute separations." Furthermore, the agent advised that "the 8" hollow concrete floor plans, are non-combustible, and according to the shop drawings by Coreslab included in the file, provide a fire resistance rating of 2 hours.

The Agent submitted that the existing ground floor units which are affected by the dead end corridor

situation are all provided with a second and separate means of egress by way of patio doors leading directly to the exterior of the building. In this regard, the Agent submitted that the dead-end corridors on the ground floor are permissible when considering Sentences 3.3.1.9.(9) and 3.3.4.4.(7) of the OBC. Furthermore, while acknowledging that the second floor units are not similarly equipped with a separate means of egress, the Agent submitted that each unit is provided with an existing balcony that may function as an area of refuge to occupants of that suite. These areas of refuge, he argued, would allow "for the safe evacuation of all second floor apartments, roughly equivalent in value to a second egress for each tenancy."

In summation, the Agent submitted that the proposed compensating measures would "enhance life safety in this existing building, while avoiding the expensive difficult, impractical and unattractive options suggested by the Respondent."

6. Respondent's Position

Legal Counsel for the Respondent provided the Commission with further background information acknowledging that the original permits were issued in error in 1985. As a result of this error a claim was filed by the Applicant against the municipality and a settlement had been reached on the basis of "the total cost to rectify as well as numerous and sundry costs for the relocation and disruption of tenants during the construction." Based on this settlement, he advised that the municipality has provided the Applicant with options to achieve compliance in respect to the excessive length of the dead-end. Instead, the Applicant has brought forward a number of proposals including the use of alternative measures instead of satisfying the prescriptive Part 3 requirements of the 1983 Code.

The Respondent submitted that, upon consideration of the subject proposal, it was his opinion that it will not satisfactorily comply with the OBC requirements. He submitted that to approve the use of alternative measures, he as the CBO must be satisfied of two things. Namely, that it would be impractical to comply with the Code requirements and that the performance level of the building will be at least equal to the performance level of the building prior to construction. In both regards the Respondent submitted that the Applicant's proposal fails. He stated that there has been no proof offered by the Applicant as to the impracticality of complying with the Code nor, in his opinion, will the proposal offer an equivalent level of safety as that of a Code compliant structure.

In response to the specific aspects of the proposal the Respondent offered the following comments. In respect to consideration of the second floor balconies as "areas of refuge" the Respondent submitted that, "(w)hile the floor assembly (Coreslab) of the existing balconies may provide adequate protection from exposure to heat and flame from the fire compartment below, it wouldn't meet the intent of protection from smoke emanating from the lower unit." Moreover he suggested that the balconies would have to be fire-separated from the remainder of the building which would not be accomplished by this existing open balcony situation.

In reference to the pressurized vestibules being proposed to shorten the dead-end portions of the corridors the Respondent submitted that the creation of this separation does not redefine that portion of the hallway within the vestibule area. The "vestibule" would still form part of the dead-end corridor and therefore exceed the permitted length without providing an alternate means of exit. Furthermore, notwithstanding the Applicant's request for relief under the provisions of Article 11.5.2.1., "the acceptance of a Compliance Alterative is dependent upon the Applicant meeting both tests; i.e. not only that there is an acceptable alternative to full Code compliance, but that Code compliance cannot be achieved since it is "*impractical because of structural or construction difficulties*" (emphasis added). The

Respondent argued that the Applicant had "already been fully compensated for the rectification of the outstanding deficiencies, to full compliance with the 1983 Building Code." In his opinion the proposal put forth here is not better than or equal to those prescriptive requirements and should, therefore, be rejected.

In summation, the Respondent emphasized that the Order that had been issued came as a result of a request by the Applicant for an inspection of the structure when they were considering the conversion of the building into a condominium. It was determined at the time that a number of Code violations existed and that, as a result, the building was unsafe. Moreover, one of the options that had been provided to the Applicant as a result of the claim that was filed, should be implemented to bring the building into compliance with the 1983 OBC, which applied at the time of construction.

7. Commission Ruling

It is the decision of the Building Code Commission that the provision of two pressurized vestibules on the second floor of the building to compensate for the length of the existing dead-end corridors will provide sufficiency of compliance with Clause 3.3.4.4.(1)(a) of O. Reg. 583/83 (1983 Ontario Building Code) when considering Sentence 11.4.1.1.(1) and Article 11.5.2.1. of the 1997 Ontario Building Code on condition that:

a) The doors to the two second floor vestibules are to be equipped with magnetic hold open devices which will release upon activation of the fire alarm system.

8. Reasons

i) The proposal to create two pressurized vestibules on the second floor, effectively reducing the length of the dead-end corridors, will improve the existing corridor system in the 17 year old building that was originally approved by the municipality. The provisions of Sentence 11.4.1.1.(1) will be satisfied in that the performance level after construction will exceed the performance level of the existing building.

ii) The existing building is primarily of noncombustible construction with the exception of the roof trusses.

iii) The corridor walls have a one hour fire resistance rating which exceeds the 45 minute Code requirement. Likewise, the concrete floor construction provides a fire rating in excess of that required by the OBC.

iv) The balconies of the second floor residential suites can be considered to function as areas of refuge to occupants of those units.

v) First storey units have direct access to the exterior providing occupants of these units with an alternate means of exit.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Clause 3.11.3.1.(6)(a) and Sentence 3.11.3.1.(7) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Robert Tomei, Tridel, for the resolution of a dispute with Ann Borooah, Chief Building Official, City of Toronto, to determine whether the compensating measures offered where the slope of the bottom of the pool exceeds 8% at a water depth of 1,350 mm or less, provide sufficiency of compliance with Clause 3.11.3.1.(6)(a) and Sentence 3.11.3.1. (7) of the Ontario Building Code at Parkside at Northtown, 880 Grandview Way, Toronto, Ontario

APPLICANT	Robert Tomei Tridel North York, Ontario
RESPONDENT	Ann Borooah Chief Building Official City of Toronto
PANEL	Len King, Vice-Chair Fred Barkhouse Gary Burtch
PLACE	Toronto, Ontario
DATE OF HEARING	November 7, 2002
DATE OF RULING	November 7, 2002
APPEARANCES	Randy Brown Randal Brown & Associates Toronto, Ontario **Agent for the Applicant** Algimantas Jasinevicius Acting Manager, Plans Examination City of Toronto **Designate for the Respondent**

RULING

1. The Applicant

Robert Tomei, Tridel, has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and has constructed a residential condominium building known as Parkside at Northtown, 880 Grandview Way, Toronto, Ontario

2. Description of Construction

The Applicant has constructed an 18 storey condominium building having a Group C major occupancy classification. The structure is 1,404 m^2 in building area and comprised of noncombustible construction. It is equipped with sprinkler, standpipe and hose and fire alarm systems.

The item in dispute involves the construction of an indoor swimming pools intended for use by building occupants and their guests. The pool has been constructed such that a portion of the pool having a water depth of less than 1,350 mm provides a slope which exceeds 8%. Where the depth of the pool falls between 1,066.8 mm (42 in) and 1,346.2 mm (53 in), the slope increases from 6 % to 10%. To compensate for this deficiency the Applicant is proposing an additional safety line situated 300 mm to the shallow side of the point where the gradient increases to 10%. This safety line would be a permanent fixture, mechanically fastened to the pool. It is also intended that the water depth be indicated on both sides of the pool deck to alert bathers to any hazards associated with the increased depth.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the compensating measures proposed where the slope of the pool deck exceeds 8% at a water depth of less than 1350 mm provide sufficiency of compliance with Clause 3.11.3.1.(6)(a) and Sentence 3.11.3.1.(7) of the Ontario Building Code (OBC).

Clause 3.11.3.1.(6)(a) provides that, with exceptions not applicable here, the slope of the bottom of any portion of a pool where the water depth is 1,350 mm or less shall not exceed 8%. Sentence (7), again with exceptions not applicable here, permits that where the slope of any portion of the pool exceeds 8%, the walls of the pool are to be equipped with recessed fittings to which a buoyed safety line could be attached across the water surface. The recessed fittings are to be installed at a horizontal distance of at least 300 mm towards the shallow end of the pool.

The shallow end of the subject pool initially provides a slope of 6% until a water depth of 1,066.8 mm (42 in) is reached. Between 1,066 mm and 1,346.2 mm (53 in) the slope at the bottom of the pool increases to approximately 10%, thereby exceeding the 8% standard permitted where the depth is less than 1,350 mm.

The Applicant is proposing certain measures aimed to compensate for the steeper slope at this water depth. Namely, an additional buoyed safety line is proposed, 300 mm toward the shallow side of the point where the slope increases from 6% to 10%. Further, both sides of the pool deck are to be permanently marked to indicate the water depth at each of the safety lines being provided.

4. Provisions of the Ontario Building Code

3.11.3.1. Construction Requirements

(6) Except for a *modified pool*, a *wave action pool* and a pool used exclusively for scuba diving, the slope of the bottom of any portion of a *public pool* shall not exceed

(a) 8% where the water depth is 1 350 mm (4 ft 5 in) or less,

(7) Except for a *modified pool* and *wave action pool*, where the slope of any portion of the bottom of a *public pool* is more than 8%, the walls of the pool shall be equipped with recessed fittings to which a safety line supported by buoys can be attached across the surface of the water and the recessed fittings shall be installed at a horizontal distance of at least 300 mm (11¾ in) measured from the vertical projection of the top of the slope in the direction of the shallow end of the pool.

5. Applicant's Position

The Agent for the Applicant submitted that the subject swimming pool has been constructed such that the slope in a portion of the pool where the water depth is less than 1,350 mm exceeds the 8% permitted by the Code. He advised that in the shallow end of the pool where the water is between 34 in and 42 in deep the pool slope is approximately 6%. The grade changes however, where the water is 42 in to 53 in deep, providing a slope of approximately 10%.

The Agent advised that because of the long term potential for spalling of finishes, it would not be advisable to alter the existing floor of the pool or to add a new flooring over the existing finished floor. He acknowledged, however, that the slope did not conform with the OBC requirements and offered certain measures to provide an equivalent level of safety in the pool environment. The Agent stated that, in his opinion the intent of Sentences 3.11.3.1(6) and (7) is to provide users of the pool with a warning of the change in gradient slope. To satisfy this intent, in addition to the provision of the required safety line prior to the 1,350 mm depth mark, the Applicant is offering an additional safety line, 300 mm toward the shallow side of the pool where the change in slope occurs.

The Agent suggested that, "(i)n this manner, bathers will have entered the pool but will not have built up a momentum to carry them into the deep end of the pool." It was his opinion that the additional safety line would provide bathers with advanced notification of a change in gradient and that an equal level of life safety would be provided. When questioned, the Agent also stated that he would agree to the safety lines being permanent fixtures and would further accept a condition requiring that the pool deck be marked to indicate the depth at each line. In addition he offered to include the requirement for safety lines within the Condominium documents or register them on title, which ever proved more efficient.

6. Respondent's Position

The Designate for the Respondent submitted that the slope at the bottom of the pool exceeded the Code permitted 8%. He felt that there was insufficient background information and experience in the Building Department for him to make a determination as to whether the additional safety line would provide an equivalent level of safety where the slope exceeds the permitted maximum at a depth of less than 1,350 mm.

7. Commission Ruling

It is the decision of the Building Code Commission that the compensating measures offered where the slope of the bottom of the pool exceeds 8% at a water depth of 1,350 mm or less, will provide sufficiency of compliance with Clause 3.11.3.1.(6)(a) and Sentence 3.11.2.1.(7) of the Ontario Building Code at Parkside at Northtown, 880 Grandview Way, Toronto, Ontario on condition that:

a) Two buoyed safety lines be installed, one of which will be positioned 300 mm in advance of the 1,350 mm depth mark, as required by Sentence (7) and the second to be positioned 300 mm toward the shallow side of the point at which the slope of the pool bottom increases from 6% to 10%.

b) The two safety lines are to be permanently installed and mechanically fastened in such a manner that they will not be able to be removed without the use of tools.

c) The water depth is to be permanently marked on both sides of the pool deck at the two safety lines.

d) The requirements for the additional safety line and deck markings are to be either registered on title or in the appropriate condominium documents to ensure future owners are aware of the prerequisite conditions for use of the pool.

8. Reasons

i) With fulfillment of the conditions imposed, the compensating measures will achieve sufficiency of compliance with the requirements of the Code.

Dated at Toronto this **7th** day in the month of **November** in the year **2002** for application number **2002-35**.

AND IN THE MATTER OF an application by Martin Bruggeman, LA Lutte Holdings Ltd., for the resolution of a dispute with Rocky Cerminara, Chief Building Official, City of London, to determine whether the insulation used to wrap the attic duct work provides sufficiency of compliance with Sentences 9.25.2.3.(1), 9.33.1.1.(1) and 6.2.4.3.(1) and whether the as-constructed wall assembly complies with the air barrier and vapour barrier requirements of Sentence 9.25.3.1.(1), 9.25.3.2.(1), 9.25.3.3.(1) and 9.25.4.1.(1) when considering Sentences 5.4.1.1.(2) and 5.5.1.1.(2) of the Ontario Building Code at 7 McAlpine Avenue, London, Ontario.

APPLICANT	Martin Bruggeman LA Lutte Holdings Ltd. London, Ontario
RESPONDENT	Rocky Cerminara Chief Building Official City of London
PANEL	Len King, Vice-Chair Fred Barkhouse Gary Burtch
PLACE	Toronto, Ontario
DATE OF HEARING	November 7, 2002
DATE OF RULING	November 7, 2002
APPEARANCES	Martin Bruggeman LA Lutte Holdings Ltd. London, Ontario **The Applicant** Owen Clarke Manager of Inspections City of London **Designate for the Respondent**

RULING

1. The Applicant

Martin Bruggeman, LA Lutte Holdings Ltd., has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and has constructed a residential dwelling at 7 McAlpine Avenue, London, Ontario.

2. Description of Construction

The Applicant has constructed a Group C residential dwelling. The structure has a building area of 80.26 m^2 and a building height of one storey. It is comprised of combustible construction and will be used as the personal residence of the Applicant.

There are two items of construction in dispute. The first dispute involves the type of insulation applied to the duct work in the unheated attic. In this regard, the ducts have been wrapped with Reflectix, which is a reflective insulating product using aluminum foil as a reflector of heat energy, resulting in a thermal resistance of RSI 1 (R 5.6).

The second item in dispute involves the plywood sheathing used in the wall assembly and whether the joints and seams must be sealed in such a way as to provide a continuous air barrier. Presently, the sheathing has been installed as a vapour barrier and no air barrier system is being provided.

3. Dispute

The issues in dispute between the Applicant and Respondent is whether the insulation provided around the duct work in the attic provides sufficiency of compliance with Sentences 9.25.2.3.(1), 9.33.1.1.(1) and 6.2.4.3.(10) of the Ontario Building Code (OBC) and whether the vapour barrier/air barrier systems provide comply with Sentences 9.25.3.1.(1), 9.25.3.2.(1), 9.25.3.3.(1), and 9.25.4.1.(1) when considering Sentences 5.4.1.1.(2) and 5.5.1.1.(2) of the OBC.

Sentence (1) of Article 9.25.2.3. states that insulation shall conform to one of the listed CAN/CGSB Standards. Further, Sentence 9.33.1.1.(1) requires the design and installation of central heating systems, including the requirements of combustion air, to conform with the provisions of Part 6. In this regard, Article 6.2.4.3. governs the construction and installation of ducts and plenums. Sentence 6.2.4.3.(10) specifies that, where supply or return ducts are not protected by an insulated exterior wall or are exposed to unheated space, they must be insulated to provide a thermal resistance of at least RSI 2.1 (R12).

Based on the information provided to the BCC, it does not appear that the Reflectix radiant heat reflector which has been utilized to insulate the duct work in the attic of the subject dwelling has been approved under one of the listed standards outlined in Sentence 9.23.2.3.(1). However, an evaluation has been undertaken by the National Research Council of Canada to determine whether the product could be used as part of an insulating system in a wall cavity. It has not, however, been certified for use around duct work. Further, the Reflectix radiant heat reflector which provides an "R" value of R5.6 when installed to wrap heating or air conditioning ducts with a 3/4 inch airspace falls short of the R12 thermal resistance required by the Code.

In respect to the Code requirements set out in Subsection 9.25.3. for the provision of an air barrier, Sentence 9.25.3.1.(1) mandates that thermally insulated wall, ceiling and floor assemblies be constructed to include an air barrier which will provide a continuous barrier to air leakage. An "air barrier" is defined in Sentence 1.1.3.2.(1) to mean the assembly installed to provide a continuous barrier to the movement of air. Sentence 9.25.3.2.(1) provides that sheet and panel type materials may be used to provide this function if they meet the specified requirements for air-tightness. Moreover, Sentence 9.25.3.3.(1) requires that where the air barrier consists of air-impermeable panel-type materials that all joints are to be sealed to prevent air leakage.

Sentence 9.25.4.1.(1) also requires that thermally insulated wall, ceiling and floor assemblies be constructed with a vapour barrier which will prevent condensation in the wall spaces, floor spaces or attic and roof spaces. For the purposes of applying the code requirements it should be noted that the vapour barrier may also be installed to act as the air barrier. Where this occurs, the vapour barrier must also meet the requirements for continuity of an air barrier. To achieve this, the assembly must be free of openings where leakage could occur, sealed at all penetrations at the building envelope and installed sufficiently close to the warm side of the insulation to prevent condensation.

As part of the wall assembly subject to this dispute, plywood sheathing has been used. A distinct air barrier has not been included in the construction and the joints, seams and penetrations, of the vapour barrier have not been caulked or sealed in such as way at provide a continuous, air-tight assembly which would allow the vapour barrier to act as the air barrier. In this regard, the Applicant refers to Sentences 5.4.1.1.(2) and 5.5.1.1.(2) of the Code which provide that neither an air barrier nor a vapour barrier is required where it can be shown that uncontrolled air leakage and vapour diffusion will have no adverse affect on either the health and safety of the building users, the intended use of the building or the operation of the building services. No further information has been offered in this regard.

4. Provisions of the Ontario Building Code

9.25.2.3. Insulation Materials

(1) Except as required in Sentence (2), thermal insulation shall conform to the requirements of

(a) CAN/CGSB-51.20-M, "Thermal Insulation, Polystyrene, Boards and Pipe Covering",
(b) CGSB 51-GP-21M, "Thermal Insulation, Urethane and Isocyanrate, Unfaced",
(c) CAN/CGSB-51.23, "Spray Applied Rigid Polyurethane Cellular Plastic Thermal Insulation",
(d) CAN/CGSB-51.25-M, "Thermal Insulation, Pheonolic, Faced",
(e) CAN/CGSB-51.26-M, "Thermal Insulation, Urethane and Isocyanurate, Board, Faced",
(f) CGSB 51-GP-60M, "Cellulose Fibre Loose Fill Thermal Insulation",
(g) CSA A101, Thermal Insulation, Mineral Fibre, for Buildings", or
(h) CAN/CSA-A247-M, "Insulating Fibreboard".

9.33.1.1. Design and Installation Requirements

(1) The design and installation of central heating systems including requirements for combustion air, shall conform to the requirements in Part 6 and to this Section.

6.2.4.3. Construction and Installation of Ducts and Plenums

(10) Where a *supply* or *return duct* is not protected by an insulated exterior wall or where the duct is exposed to an unheated space it shall be insulated to provide a thermal resistance of not less than RSI 2.1 (R12).

9.25.3.1. Required Barrier to Air Leakage

(1) Thermally insulated wall, ceiling and floor assemblies shall be constructed so as to include an *air barrier system* which will provide a continuous barrier to air leakage

(a) from the interior of the *building* into wall, floor, *attic* or *roof spaces* sufficient to prevent excessive moisture condensation in such spaces during the winter, and

(b) from the exterior inward sufficient to prevent moisture condensation on the room side during winter.

9.25.3.2. Air Barrier System Properties

(1) Sheet and panel type materials intended to provide the principal resistance to air leakage shall have an air leakage characteristic not greater than 0.02 L/(s•m^2) (0.004 cfm/ft^2) measured at an air pressure differential of 75 Pa (0.011 psi).

9.25.3.3. Continuity of the Air Barrier System

(1) Where the *air barrier system* consists of an air-impermeable panel-type material, all joints shall be sealed to prevent air leakage.

9.25.4.1. Required Barrier to Vapour Diffusion

(1) Thermally insulated wall, ceiling and floor assemblies shall be constructed with a vapour barrier sufficient to prevent condensation in the wall spaces, floor spaces or *attic* or *roof spaces*.

5.4.1.1. Required Resistance to Air Leakage (See Appendix A.)

(2) An *air barrier system* is not required where it can be shown that uncontrolled air leakage will not adversely affect any of

(a) the health or safety of *building* users,

(b) the intended use of the *building*, or

(c) the operation of *building* services.

5.5.1.1. Required Vapour Barrier

(3) A *vapour barrier* is not required where it can be shown that uncontrolled vapour diffusion will not adversely affect any of

(a) the health or safety of *building* users,

(b) the intended use of the *building*, or

(c) the operation of *building* services.

5. Applicant's Position

The Applicant advised that the municipality provided him with a list of building code deficiencies with respect to the residential dwelling that is being constructed. He submitted that many of the items identified on this list were not mandated by the Building Code as requirements for construction. In his opinion, the building department, therefore, had no basis for their suggestion that the joints in the ceiling vapour barrier perpendicular to the trusses be taped and sealed or for penetrations of electrical wiring through the studs to be calked, etc.

The Applicant submitted that, in his experience as a builder, caulking of the wiring does not make sense. He stated that any wind penetrating the wall assembly would be directed to the attic. In his opinion, more ventilation in this respect would be favourable and to allow air to move horizontally through the wiring penetrations would be preferable. In any event, he advised that the building officials were acting inappropriately by requesting work to be done which was not set out in the Code. The Applicant advised the Commission that, in the past, he had been asked for an engineering report for a slab on grade. He was subsequently asked for a second report after inspection even though it had been constructed as originally deigned. This, he submitted was excessive and should not have occurred. He argued that the items subject to this dispute were just further examples of the building officials exceeding their mandate.

The Applicant stated that in his reading of the Code, Sections 5.5. and 5.4. would exempt him from the requirements for the provision of a vapour barrier. He did not believe that there would be any health hazard associated with the omission of these barrier systems. Further, he stated that the plans submitted to the municipality did not illustrate an air barrier system and he was not advised that there was any issue in this regard. Now that construction was almost completed the municipality should not be able to raise new issues, particularly when not governed by the OBC.

With respect to the insulation provided around the duct work in the attic, the Applicant submitted that a CCMC report had suggested that the bubble wrap insulation used was sufficient for wall assemblies. He did not believe that to use the same product around the duct work would be a significant problem. He stated that when the attic was to be finished he would ensure that a thermal resistance of R12 was provided.

In summation, the Applicant reiterated his position that the municipal officials were pursuing standards of construction which lay beyond the parameters of the Building Code. He felt that he was being treated unreasonably and had, in the past, requested the involvement of a different building official in hopes of coming to a solution to these outstanding problems. He advised the Commission that he had been denied this request and continued to maintain that there was a bias against him in the application of the Code.

6. Respondent's Position

The Designate for the Respondent submitted that Subsections 9.25.3. and 9.25.4. outline the requirements for the provision of air barrier and vapour barrier systems. At the time the building was inspected several deficiencies in this regard had been noted, particularly with respect to the continuity of the air barrier. The Designate submitted that in this situation the vapour barrier is also acting as an air barrier and, in this regard, must be adequately sealed to prevent air and moisture penetration. In the municipality's list of deficiencies provided to the Applicant, they made suggestions as to how this could accomplished, namely, by caulking the joints and penetrations. He did not believe this to be an unreasonable request and stated that the requirements certainly fell within the parameters of the Ontario Building Code.

In respect to the insulation that has been installed around the duct work in the attic, the Designate advised that the R value did not meet the Code requirements for R12 thermal resistance. He further stated that the product had not been approved for the use to which it has been employed and, despite the Applicant's offer to properly insulate at the time the attic was finished, he expressed concern with allowing the foil sided bubble wrap to remain in place around the heating ducts.

In summation, the Designate submitted that all of the deficiencies listed by the municipality as requiring attention were governed by the requirements of the Building Code. In respect to the Applicant's request for consideration under Sections 5.4. and 5.5. for the omission of the air and vapour barriers, the Designate submitted that Part 9 of the Code is applicable to the subject building. Furthermore, the onus would be on the Applicant to provide documentation to illustrate how the prerequisites for omission outlined in the Code would be met.

7. Commission Ruling

It is the decision of the Building Code Commission that the insulation used to wrap the attic duct work does not provide sufficiency of compliance with Sentences 9.25.2.3.(1), 9.33.1.1.(1) and 6.2.4.3.(1) and further, the as-constructed wall assembly of the 80.3 m^2 residential dwelling does not comply with the, air barrier and vapour barrier requirements of Sentence 9.25.3.1.(1), 9.25.3.2.(1), 9.25.3.3.(1) and 9.25.4.1.(1) when considering Sentences 5.4.1.1.(2) and 5.5.1.1.(2) of the Ontario Building Code at 7 McAlpine Avenue, London, Ontario.

8. Reasons

i) The insulation provided around the duct work in the attic is not listed as an approved insulating material under Article 9.25.2.3. and provides a thermal resistance of only RSI 1 (R 5.6). It does not, therefore, provide sufficiency of compliance with the insulation requirements of the Code.

ii) The vapour barrier which is also being used as an air barrier in this building is not currently a continuous element. The barrier must have all joints sealed in accordance with the requirements of 9.25.3.3.

iii) Part 5 of the Building Code cannot be considered in respect to the omission of the required building systems as this part of the Code is not applicable to the subject construction. Furthermore, evidence would be required to ensure that there would be no adverse impacts as a result of the omission of these systems. No such evidence was provided.

Dated at Toronto this **7th** day in the month of **November** in the year **2002** for application number **2002-32**.

Application No. 2002-31

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 3.2.4.19.(10) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Elver Pippo, Concord Adex Development Corporation, for the resolution of a dispute with Ann Borooah, Chief Building Official, City of Toronto, to determine whether the proposed use of Class B wiring for line isolator modules located inside a residential suite and designed to isolate a signal circuit during an alarm condition only, complies with Sentence 3.2.4.19.(10) of the Ontario Building Code at the Concord Adex Development, Blocks 20/23, Towers A and B, in the City of Toronto, Ontario.

APPLICANT	Elver Pippo Concord Adex Development Corporation Toronto, Ontario
RESPONDENT	Ann Borooah Chief Building Official City of Toronto
PANEL	Kenneth Peaker, Chair Robert De Berardis Tony Chow
PLACE	Toronto, Ontario
DATE OF HEARING	October 17, 2002
DATE OF RULING	October 17, 2002
APPEARANCES	Allan Larden Larden Muniak Consulting Inc. Toronto, Ontario **Agent for the Applicant** David Craig Toronto Fire Service City of Toronto **Designate for the Respondent**

RULING

1. The Applicant

Elver Pippo, Concord Adex Development Corporation, has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is constructing two high-rise residential buildings at the Concord Adex Development, Blocks 20/23, Towers A and B, in the City of Toronto, Ontario.

2. Description of Construction

The Applicant is constructing two 49 storey residential buildings, each having a building area of 4,200 m^2. The buildings are comprised of noncombustible construction and are equipped with sprinkler, standpipe and hose and fire alarm systems.

The construction in dispute involves the design of the fire alarm system, specifically with respect to the audibility and protection of in-suite signalling devices within the residential units. It is proposed that each in-suite audible device be equipped with an isolator module capable of isolating the signal during an alarm condition only. It is further proposed that Class B wiring be used in the connection of the system and that the isolator modules be situated inside the residential suites.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed use of Class B wiring for isolator modules, designed to isolate a sound signal during an alarm situation only, and where the modules are located in the residential suites complies with the requirements of Sentence 3.2.4.19.(10) of the Ontario Building Code (OBC).

This Sentence requires that fire alarm audible devices which are located within a dwelling or suite of residential occupancy must be connected to the fire alarm system in a manner that would ensure that disconnection or damage to an audible device would not prevent other devices from sounding an alarm. At issue is whether the proposed system which includes the use of isolator modules situated within the residential suites and wired using Class B wiring and which will provide protection to the in-suite fire alarm signal devices when such devices are disabled only after the fire alarm has been activated complies with the OBC requirement in this regard.

4. Provisions of the Ontario Building Code

3.2.4.19. Audibility of Alarm Systems

(10) A fire alarm audible signal device located within a *dwelling unit* or a *suite* of *residential occupancy* shall be connected to the fire alarm system in a manner that disconnection of, or damage to, that device will not interfere with the ability of devices in other *dwelling units*, *public corridors*, or *suites* to sound an alarm. (See Appendix A.)

5. Applicant's Position

The Agent for the Applicant advised that, as a result of a previous Commission ruling which determined that in-suite devices were to be isolated, a further issue has arisen in respect to the installation of devices

which would perform this function. A specific issue arose when the City's Fire Department was reviewing the installation of the system in place in the subject building. During their testing procedures it was discovered that, although the isolator modules were incorporated into the fire alarm system, they protected the audible signal only after the fire alarm system had been activated. If a short were created when in stand-by mode, the circuit failed to activate when a fire alarm was initiated.

In support of the use of these modules the Agent advised that this type of isolator had been used in many buildings over a number of years and there has never been a problem with their operation. He suggested that the intent of the Code was to protect the devices during the time when someone may become annoyed at the sound of the alarm. In this respect, the subject modules, he argued, would protect the circuit as the fire alarm would have already sounded. He stated that there was no presumption in the Code that the device would be tampered with when it was silent. Further, if the devices were tampered with during this time a trouble signal would be activated and building maintenance would be alerted to the problem.

The Agent advised that a second issue relative to the installation of these devices is whether Class A or B wiring must be used. He submitted that, while the City is insisting that only Class A wiring is acceptable, there is nothing in the Code standard which would suggest that to be the case. He argued that Class B wiring in combination with the isolator modules would be sufficient to perform the function anticipated by Sentence 3.2.4.19.(10).

A third factor in the appropriate installation of the modules is whether they can be located inside the residential suites. Again, he stated, the Code does not dictate where these devices are to be positioned. In respect to all of the issues that have arisen the Agent stated that, while he understands the City's attempt to attain perfection in the design of the system, the is no qualification of any hazard involved in alternate proposals. In addressing all possible contingencies for failure the City is merely postulating as to what might constitute a better design. They cannot impose an unsupported notion as being required by the Code.

In summation, the Agent reiterated that there were three issues to be determined in respect to acceptable installation of the isolator modules. Namely, whether the modules were required to isolate a signal when in stand-by mode, whether Class A wiring was required and, lastly, whether the modules were required to be located outside of the residential suites. He submitted that the proposal in the subject building to use modules, located within the residential suites using Class B wiring and designed to isolate a signal during an alarm condition, complies with the meaning and intent of the OBC.

6. Respondent's Position

The Designate for the Respondent submitted that the Applicant has accurately described the disputed issues. In his Department's review of the fire alarm system they had concern with regard to the three areas of installation. The first concern arose when it was discovered that the proposed isolator modules would only serve to isolate the signal if damage occurred during a fire alarm situation. In his opinion, the Designate stated, the isolators must also function when in stand-by mode. This will protect the device in the event of vandalism or a short circuit. His interpretation of the disputed Code provision requires that audible devices must be isolated so that they would continue to sound if one were damaged. This should occur even if the devices are not already sounding.

The Designated admitted that for a period of time the subject modules `were permitted, however, as they learned more about their effectiveness they no longer consider them acceptable. He suggested that there are other devices supplied by different manufacturers which would perform the desired function.

The aim in this regard, as always, is to improve the life safety conditions for the building occupants.

The Designate advised that, with respect to the location of the isolator modules inside the residential suites and the requirement for use of Class A wiring, he was implementing the conditions for acceptance outlined in an opinion letter from the Building and Development Branch of the Ministry of Municipal Affairs. Class A wiring, he argued, provides a superior level of protection to the Class B alternative. Further, in allowing the isolator modules to be positioned inside the residential units, damage could occur to the device should a fire erupt within the suite. His goal in both regards is to protect the integrity of the in-suite audible devices. While the Code is not specific as to how this may be accomplished, its intent is to provide an appropriate level of protection. In his opinion, this level of protection may not achieved with the use of Class B wiring or if the devices are situated within the residential units.

In summation, the Designate stated that it is not uncommon for in-suite audible devices to become inoperable, particularly in a high rise building. He was most concerned with the reaction of individuals when an alarm signal stops sounding. In situations where this has occurred people stopped reacting assuming that the emergency situation no longer existed. This occurs despite the continued signal from elsewhere in the building. In requiring the level of protection being sought, the goal is to prevent similar situations from occurring in the future.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed use of Class B wiring for line isolator modules located inside a residential suite and designed to isolate a signal circuit during an alarm condition only, does not comply with the requirements of Sentence 3.2.4.19.(10) of the Ontario Building Code at the Concord Adex Development, Blocks 20/23, Towers A and B, Toronto, Ontario.

8. Reasons

i) The proposed system, which includes the use of isolator modules which will not protect the audible devices if damaged or tampered with when the system is in stand-by mode. This does not provide a sufficient level of protection to the audible devices as is anticipated by Sentence 3.2.4.19.(10).

Application No. 2002-30

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 9.10.9.11.(2) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Jodi Lougheed, property owner, for the resolution of a dispute with Don Warner, Chief Building Official, Township of Brock, to determine whether the existing use of the subject building would require a firewall to separate the residential occupancy from the horse stable when considering Article 1.2.1.2. of the National Farm Building Code or whether, in the alternative, the proposed fire separation between the two uses will provide sufficiency of compliance with Sentence 9.10.9.11.(2) of the Ontario Building Code at 1605 Concession 7, R.R. #3, in the Township of Brock, Ontario.

APPLICANT	Jodi Lougheed Property owner Sunderland, Ontario
RESPONDENT	Don Warner Chief Building Official Township of Brock
PANEL	Kenneth Peaker, Chair Robert De Berardis Tony Chow
PLACE	Toronto, Ontario
DATE OF HEARING	October 17, 2002
DATE OF RULING	October 17, 2002
APPEARANCES	Jodi Lougheed Property owner Sunderland, Ontario **The Applicant** Don Warner Chief Building Official Township of Brock **The Respondent**

RULING

1. The Applicant

Jodi Lougheed, property owner, has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is proposing the construction of a fire separation between the existing residential and farm related portions of the building at 1605 Concession 7, R.R. #3, in the Township of Brock, Ontario.

2. Description of Construction

The Applicant is proposing an addition to the residential portion of an existing building which has been classified as containing both Group C and Group F, Division 3 major occupancies. The structure is one storey in building height, and with the inclusion of the addition, will be 526 m^2 (5,662 ft^2) in building area. It is comprised of combustible construction and is not equipped with either sprinkler, fire alarm or standpipe and hose systems. The F3 occupancy portion of the building, comprising 320.52 m^2, is essentially used as a horse stable while the remaining Group C occupancy is a single residential unit.

The Applicant purchased the subject property and existing building in June 2002. The existing structure was originally constructed as a barn with an attached tack room. This tack room was converted into a residence by the previous owners without the benefit of a permit. At the time of purchase by the Applicant there was an outstanding work order against the property directing the previous owners to separate the two occupancies with a firewall.

The construction in dispute involves the nature of the separation to be provided between the two uses. The Applicant is proposing a one hour fire separation between the two occupancies using an assembly of wood studs and fire-rated drywall, whereas the Respondent is requiring a two hour firewall to be constructed between what he classifies as a residential use and a farm building.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether a two hour firewall is required between the two occupancies when considering Article 1.2.1.2. of the National Farm Building Code of Canada or whether the proposed one hour fire separation between the two existing uses, namely a Group C residential dwelling and a Group F, Division 3 horse stable, provides sufficiency of compliance with Sentence 9.10.9.11.(2) of the Ontario Building Code (OBC).

Article 1.2.1.2. of the National Farm Building Code of Canada defines "farm building" as being a building or part of a building which does not contain a residential occupancy and which is associated with and located on land devoted to the practice of farming. Furthermore, it is a building used essentially for the housing of equipment or livestock, or the storage, production or processing of produce or feeds. The Respondent's position in this regard is that the use of a portion of the building for a horse stable, which he considers to constitute a farm building, precludes the inclusion of residential occupancies within the same building. As a result, he is requesting the erection of a two hour firewall between the two occupancies to divide the structure into two separate buildings.

Sentence (2) of Article 9.10.9.11. states that, with an exception not applicable here, a residential major occupancy, including live/work units, must be separated from other major occupancies classified as mercantile or medium hazard industrial occupancies with a separation having a fire-resistance rating of at least two hours.

As noted above, the existing building contains both Group C and F3 occupancies and houses a single residential unit and a horse stable. The Applicant is proposing a fire separation between the two occupancies having a one hour fire-resistance rating. They would be amenable to an increase in the resistance rating of a fire separation, however, because of construction constraints consider it excessive to require the two hour firewall requested by the Respondent.

4. Provisions of the Ontario Building Code

Article 1.2.1.2. Defined Words and Phrases
National Farm Building Code of Canada, 1995

> *Farm building* means a *building* or part thereof which is associated with and located on land devoted to the practice of farming, and used essentially for the housing of equipment or livestock, or the production, storage or processing of agricultural and horticultural produce or feeds.

9.10.9.11. Separation of Residential Occupancies

(2) Except as provided in Sentence (3), a *major occupancy* classified as a *residential occupancy*, including *live/work units*, shall be separated from other *major occupancies* classified as *mercantile* or *medium hazard industrial occupancies* by a *fire separation* having a *fire-resistance rating* of not less than 2 h.

5. Applicant's Position

The Applicant provided the Commission with a brief history of the subject site, advising that the existing building had been converted by the previous owners to include a residential dwelling and a horse stable. She stated that, because these two occupancies were not separated, the building was in contravention of the Code and a work order was issued by the municipality in this regard. She was aware of this outstanding work order at the time of the purchase of this property and she had also been advised that steps were being undertaken by the previous owners to respond to the work order. In this regard, an engineering firm had been retained to design the necessary firewall.

The Applicant advised that she took possession of the building on June 28, 2002 and was prepared to carry out construction of the firewall. It was at this point that she became aware that the design plans which were prepared could not be used as the previous owners had failed to pay for the engineered drawings. In addition, during this time, she stated that a masonry professional had reviewed the design and expressed concern that the firewall may jeopardize the integrity of the pre-engineered roof trusses which would have to be cut to accommodate the separation. Morever, in his opinion the design of the firewall was excessive. It was at this point the Applicant advised that she approached the municipality again to discuss alternatives to the masonry firewall.

The Applicant submitted that she retained the services of another engineer who was of the opinion that, despite the definition of "farm building" in the National Farm Building Code, provisions in the Ontario Building Code would permit the use of a fire separation as opposed to a firewall. Plans to this effect were drawn up and submitted to the municipality and a building permit was issued by one of the municipal inspectors. This was done at a time when the Chief Building Official was absent and, upon his return, the proposed fire separation was questioned. All work on the construction has since stopped and the Applicant stated they are seeking a ruling on the appropriate separation from the Building Code Commission.

In respect to the use of the subject building, the Applicant advised that the horse stable portion of the structure is used strictly to house horses. There is no storage of hay or other combustible materials in the building. She further advised that the Group C portion of the structure is her personal residence. It is presently a fairly small living unit, measuring providing 918 ft^2, and she is seeking to expand that portion of the structure. The Applicant further stated that she would be willing to install a fire alarm system in the building, including both heat and smoke detectors if this were considered appropriate by the Commission.

In summation, the Applicant advised that in her interpretation of the Ontario Building Code, a fire separation between the two uses could be permitted rather than the firewall requested by the municipality. She acknowledged the Respondent's concern with respect to the definition of "farm building" but submitted that the housing of a few horses for recreational purposes did not seem to completely fall within that definition.

6. Respondent's Position

The Respondent submitted that in 1988 a permit was issued to the previous owners for the construction of a barn and tack room. It was then discovered that the tack room had been converted to habitable space and was being used as living quarters. Following some legal discussions involving the applicability of various municipal regulation, it was decided that some improvements to the building could be undertaken to turn the tack room into a dwelling unit.

The Respondent advised that the primary factor in his requirement for a firewall to separate the residence from the horse stable is the definition of "farm building" found in the National Farm Building Code of Canada. In his opinion a farm building precludes any residential component from being included within the same structure. As such, with the construction of a masonry firewall, two buildings will be created and the structure will then comply with the Code. He stated that a permit had been issued for the construction of such a firewall but intervening occurrences have, thus far, prevented its erection.

The Respondent acknowledged that there may be structural concerns where the proposed firewall intersects the roof trusses but his aim is this regard is still to create two separate buildings. Aside from that he did not believe that a fire separation would comply with the requirements of the Code in Sentence 2.1.1.5.(2) which state that farm buildings must conform with the requirements of the Farm Code.

In summation, the Respondent submitted that the root of the problem stems from the definition of a farm building and whether this definition applies to the subject structure. He acknowledged the Applicant's efforts to achieve an acceptable level of safety but felt that a fire separation simply did not comply with the requirements of the regulations.

7. Commission Ruling

It is the decision of the Building Code Commission that a fire separation between the existing residential dwelling and horse stable in the subject building will provide sufficiency of compliance with Sentence 9.10.9.11.(2) of the Ontario Building Code at 1605 Concession 7, R.R. #3, in the Township of Brock, Ontario on condition that:

a) A two hour fire separation is to be constructed between the existing residence and the stable.

b) A fire alarm system providing heat detection in the horse stable and smoke detectors in the residence is to be installed.

8. Reasons

i) The subject horse stable is considered to be a storage facility where only horses are housed. No combustible material is to be stored within the horse stable.

ii) With implementation of the above conditions, sufficiency of compliance will be achieved in this existing building.

Dated at Toronto this **17th** day in the month of **October** in the year **2002** for application number **2002-30**.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 8.2.1.3.(2) and Table 8.2.1.3.B. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Sandy Gott, Ice River Springs, for the resolution of a dispute with Rick Cole, Chief Building Official, Municipality of Grey Highlands to determine whether the enlargement of the existing septic system to accommodate a proposed daily design flow rate of 8,000 L/day to service a warehouse addition provides sufficiency of compliance with Sentence 8.2.1.3.(2) and Table 8.2.1.3.B. of the Ontario Building Code when considering the number of loading bay doors at the Ice River Springs facility, Part Lot 15, Concession 9, Municipality of Grey Highlands, Ontario.

APPLICANT	Sandy Gott Ice River Springs Feversham, Ontario
RESPONDENT	Rick Cole Chief Building Official Municipality of Grey Highlands
PANEL	Frank Wright, Chair-Designate Doug Robinson Bill Fellner
PLACE	Toronto, Ontario
DATE OF HEARING	October 3, 2002
DATE OF RULING	October 3, 2002
APPEARANCES	Brian Dempsey DBD Systems Inc. Singhampton, Ontario **Agent for the Applicant** Rick Cole Chief Building Official Municipality of Grey Highlands **The Respondent**

RULING

1. The Applicant

Sandy Gott, Ice River Springs, has applied for a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is proposing to construct an addition to the existing warehouse facility at Ice River Springs, Part Lot 15, Concession 9, Municipality of Grey Highlands, Ontario.

2. Description of Construction

The Applicant is proposing to construct a 12,493 m^2 addition to an existing 12,352 m^2 Group F, Division 3 warehouse facility. The existing building contains a total of 25 loading bays and five water closets. The addition would provide for an additional two water closets and 24 loading bays. The warehouse is presently serviced by an existing Class 4 system constructed in 2002.

The site is relatively flat and the native soil, which consists of a gravel/sand/silt mixture, provides a percolation time of 8 to 10 minutes per centimetre. There are presently two septic systems located on the property. The more recently installed system was designed to service a previous addition and was oversized to accommodate further anticipated expansions. The system currently in operation provides a reinforced 22,730 litre, two chamber septic tank, a 2,700 litre pump station and 50.8 mm (2 in) force main. There are two cells of tile distribution and each cell contains 7 runs of 30.5 metre distribution pipe. The site also accommodates an additional 4,500 litre, 2 chamber tank, 2,700 litre pump station and 50.8 mm (2 in) force main which serviced the original building when it was constructed in 2000.

The construction in dispute involves the construction of the new building addition and requirement to enlarge the existing septic system. The proposal by the Applicant in this regard is to provide a system having a total daily design capacity of 8,000 litres per day. When considering the Building Code specifications for warehouses, however, which include the total number of water closets and loading bays in the calculation requirements, the resulting total daily design flow is 14,000 litres per day. In support of the proposed system design the Applicant cites special circumstances in relation to the operation of the facility and has offered measures to ensure that the facility will operate as anticipated.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the enlargement of the proposed system to accommodate a total daily design flow of 8,000 litres per day provides sufficiency of compliance with the provisions of Sentence 8.2.1.3.(2) and Table 8.2.1.3.B. of the Ontario Building Code (OBC).

Article 8.2.1.3. establishes the requirements for calculation of the total daily design flow for a sewage system. Sentence (2) provides that, for occupancies other than residential occupancies, the flow shall be determined by reference to Table 8.2.1.3.B. This Table, which forms part of Sentence 8.2.1.3.(2), provides values for the total daily design flow for a number of non-residential uses including warehouse establishments. In this regard, the daily design flow for a warehouse use is to be calculated based on the figures established for the number of water closets and the number of loading bays being provided.

For the subject building, when calculating total daily design flow based on the table values, the expected daily flow would be 14,000 litres per day, placing the system outside the governance of the Ontario Building Code. For the purposes of this dispute, however, while acknowledging that the building is a

warehouse facility, the Applicant argues that the figures established in the Code do not provide for an accurate calculation of daily flow for the site. In the Applicant's estimation, a system designed to accommodate a total daily flow of 8,000 litres per day would be sufficient to service the building. In support of this request for a ruling on sufficiency of compliance, the Applicant is relying on consideration of special circumstance and measures that would ensure that the warehouse operates as designed, to limit occupancy and use of washroom facilities.

It should be noted that, because the regulatory environment governing sewage systems and sewage works in Ontario is divided between Part 8 of the Ontario Building Code and Section 53 of the *Ontario Water Resources Act* (OWRA - a Ministry of Environment legislation), the Commission must consider under which of these jurisdictional spheres an application will fall. If, upon consideration, the Commission determines that the system has a total daily design flow of greater than the 10,000 litre per day cap set by the OBC, the design would then be considered a sewage work, subject to the requirements of OWRA.

4. Provisions of the Ontario Building Code

8.2.1.3. Sewage System Design Flows

(2) For all other *occupancies*, the total daily design *sanitary sewage* flow shall be at least the value in Column 2 as determined from Table 8.2.1.3.B. (See Appendix A.)

Table 8.2.1.3.B.
Other *Occupancies*
Forming Part of Sentence 8.2.1.3.(2)

Warehouse		
a)	Per water closet, and	950
b)	Per loading bay	150

5. Applicant's Position

The Agent for the Applicant submitted that the Code requirement to assess daily design flow based on the number of loading bays was not appropriate when applied to the subject building. The inference in this requirement is that the level of sewage generated would increase when considering the number of truck drivers that may use the facilities of the building. This, he argued, would not be the case with the operation of this warehouse. He felt it would be more appropriate to base the total daily design flow for the system on either the number of plumbing fixtures in the building or on occupant load which is relatively low in this instance.

The Agent advised that truck drivers are not allowed into the building itself and that portable toilets are provided on site for their specific use. He did not feel that the daily design flow calculated when using the Code referenced standards was truly reflective of the actual daily water use. Further, he provided water metre readings to support this position. As further assurance that the number of loading bays would not contribute to the level of sewage generated by the facility he advised that the owner would be willing to post signs limiting the number of occupants and prohibiting truck drivers from entering the building.

In summation, the Agent submitted that, given the unique circumstances involved in the operation of this warehouse facility, he felt there was merit to the argument that the strict prescriptive requirements of the OBC did not fully apply. The number of loading bay doors in this instance would not be indicative of the amount of sewage that would be generated and he was seeking relief from these provisions.

6. Respondent's Position

The Respondent provided the Commission with some background information on the development of the subject site. He submitted that in the year 2000 a building permit was issued for a warehouse/office building with an occupant load of 20 persons. Further, a septic permit was issued by the health unit for a system having a daily design flow of 1,500 litres per day. This system was then installed as designed. However, after further consideration, only an F3 warehouse was constructed with no office component. This warehouse building consisted of fifteen loading bay doors, one water closet and had an occupant load of four persons.

In March 2002, the Applicant applied for an addition to the facility which would consist of an expanded warehouse area increasing the number of loading bays and water closets and providing an occupant load of ten persons. A further septic permit was issued in response to this proposal, requiring a system with a design capacity of 3,250 litres per day. The original system which was installed was subsequently abandoned in favour of the larger one. The designer of the latter system further chose to design and install an oversized system to allow for further anticipated expansions. The Respondent summarized the septic systems presently located on this property as follows:

"1. 4500 litre, 2 chambers approved tank, 2700 litre pump station and a 2" force main.
2. 22,730 litre, 2 chamber approved tank, 2700 litre pump station and a 2"force main.
There are two cells of distribution tile. Each cell contains 7 runs of 30.5 metres of distribution pipe. Total distribution pipe equals 426.72 metres."

The Respondent advised that in July 2002 the Applicant applied for a further building addition which was now the subject of this hearing. The expanded facility would now comprise a total of seven water closets and 49 loading bays. Using Table 8.2.1.3.B. in reference to this new development, he has calculated the total daily design flow to be 14,000 litres per day. This, he argued, exceeds the 10,000 litre per day which is allowed under the Ontario Building Code. The development, therefore, is within the jurisdiction of the Ministry of the Environment, he stated.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed warehouse facility is a defined use as indicated in Table 8.2.1.3.B. Accordingly, when considering the number of water closets and the number of loading bays, the total daily design flow calculation exceeds 10,000 litres per day. Under Article 1.1.3.2. of the Ontario Building Code this proposed system, therefore fails to meet the definition of a sewage system. The approval of the system design, therefore, is the responsibility of the Ministry of Environment.

8. Reasons

i) For residential and other occupancies that are captured in Sentences (1) and (2) of Article 8.2.1.3.

(Tables 8.2.1.3.A. and B respectively) the total daily design flow is the key factor determining design capacity which, in turn, dictates applicable jurisdiction.

ii) The OBC requirements specific to warehouses, reference the number of loading bays as an element to be considered in the total daily design flow calculation. In this regard, the additional flow from the expansion, when added to the existing flow, would total 14,000 litres per day.

iii) Based on the above, the calculation of the total daily design sanitary sewage flow will considerably surpass the 10,000 litre per day threshold articulated in the OBC.

Ruling No. 02-30-885
Application No. 2002-27

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Articles 2.7.2.1. and 2.7.2.2. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Andrew Sherwin, owner, for the resolution of a dispute with Steve Franklin, Deputy Chief Building Official to determine whether the proposed drip irrigation leaching bed sewage system provides sufficiency of compliance with Part 8 when considering Articles 2.7.2.1. and 2.7.2.2. of the Ontario Building Code at 95 Meadowcliffe Road, Toronto, Ontario.

APPLICANT	Andrew Sherwin Property owner Toronto, Ontario
RESPONDENT	Steve Franklin Chief Building Official City of Toronto
PANEL	Frank Wright, Chair-Designate Doug Robinson Bill Fellner
PLACE	Toronto, Ontario
DATE OF HEARING	October 3, 2002
DATE OF RULING	October 3, 2002
APPEARANCES	Alexander Campbell R.J. Burnside & Associates Ltd. Orangeville, Ontario **Agent for the Applicant** Anna Sawicki Building Engineer City of Toronto **Designate for the Respondent**

RULING

1. The Applicant

Andrew Sherwin, owner, has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is proposing the construction of a drip irrigation septic system to service the dwelling at 95 Meadowcliffe Road, Toronto, Ontario.

2. Description of Construction

The Applicant is proposing an addition to the existing single detached dwelling on the subject property. The structure has a finished area of 318.6 m^2 and a total of 27 plumbing fixture units. The daily design flow rate for the property is 3,200 litres per day and the building is currently served by a conventional septic tank (4,500 L) and an in-ground leaching bed. The site itself has a variable slope, is well treed and terraced to provide lawn areas. The existing upper terrace is composed of sand fill, whereas the lower terrace is clay backfill.

To permit the expansion of the residence and to remedy the existing problems with the septic system, which is presently malfunctioning, the Applicant is proposing the installation of a drip irrigation disposal system as the most viable alterative for the disposal of sewage from the subject site. To minimize the need for regrading of the property it is proposed that the system be installed on the existing terraced areas. The soils in these areas will be excavated and replaced with clean sand fill having a percolation time of 6 - 10 min/cm.

The proposed system will be comprised of a conventional septic tank, a pump chamber and a patented pressure filter system. The pressure filter system includes multiple zones of drip irrigation tubing. In addition, as described by the Applicant's Agent "(t)he filter is equipped with a control panel which automatically back-washes the filter unit. The filter itself consists of several stackable disks held together with a spring compression unit. Effluent from the pump chamber is directed to the zones of drip tubing through a specialized controller unit in order to ensure equal distribution of effluent. The drip tubing is a specialized ½ inch tubing equipped with pressure compensating emitters. These emitters permit equal amounts of effluent to be discharged from each perforation regardless of the length of tubing, provided that the pressure within the tubing is withing (sic) the operating range of 7 to 70 psi. The normal operating limit of the system is 35 psi in order to ensure adequate pressure is available. The drip system is a closed loop system which returns effluent back to the pump chamber for further disposal if required."

The construction in dispute involves the design of the sewage disposal system which is not recognized by the Ontario Building Code (OBC). The proposal for use of this innovative system would include the use of conventional sizing criteria for systems of this type and, where possible, adherence to the requirements of the OBC.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed drip irrigation system will provide sufficiency of compliance with Part 8 of the Ontario Building Code when considering the equivalency provisions of Articles 2.7.2.1 and 2.7.2.2.

Part 8 of the Code applies to the design, construction and operation of sewage systems as defined in Article 1.1.3.2. Sewage systems meeting this definition are the Classed as one of the following; 1) a chemical toilet, 2) a greywater system, 3) a cesspool, 4) a leaching bed system or 5) a system utilizing a holding tank for the retention of hauled sewage. Subsection 2.7.1. permits the acceptance of equivalents where the chief building official is of the opinion that an equal level of performance would be achieved. Article 2.7.2.1. permits materials not specifically described in Part 8 or for which no recognized test procedure has been established, to be used if it can be determined, based on past performance or other evaluation, that the use of such materials would achieve an equal level of performance to what would be acceptable in the Code. Further, Article 2.7.2.2. provides for the acceptance of equivalent systems, again, where it can be established that the level of performance that would be achieved by conformance with the OBC requirement will be obtained.

The proposed drip irrigation sewage disposal system is not specifically described by the prescriptive requirements of Part 8 of the Building Code and, therefore, not approved for installation in Ontario. When considering the provisions of Articles 2.7.2.1. and 2.7.2.2., however, the system may be considered as an equivalent if it can be established that it would provide the level of performance that would be achieved by compliance with the requirements of Part 8. In this regard, the Applicant has outlined the design rational of the system and provided technical briefs on the use of drip disposal technology.

4. Provisions of the Ontario Building Code

Part 8 Sewage Systems

Please see Ontario Building Code.

2.7.2. Acceptance of Equivalents

Article 2.7.2.1. Materials

(1) Materials not specifically described in Parts 3, 5, 6, 7, 8 and 9, or which vary from the specific requirements in those Parts or for which no recognized test procedure has been established, may be used if the person requesting the use of such material can establish on the basis of past performance, tests described in Article 2.7.2.4. or other evaluation that the use of the proposed material will provide the level of performance that would be achieved by conformance with the requirements of the *building code*.

Article 2.7.2.2. Systems

(1) Systems not specifically described in Parts 3, 5, 6, 7, 8 and 9, or for which no recognized test procedure has been established, may be used if the person requesting the use of such system can establish on the basis of past performance, tests described in Article 2.7.2.4. or other evaluation that the use of the proposed system will provide the level of performance that would be achieved by conformance with the requirements of the *building code*.

5. Applicant's Position

The Agent for the Applicant provided the Commission with a history and background of the subject property. He advised that the site is close to the bluffs in the City of Toronto in an unserviced part of

the City. The present owners purchased the property in 1998 and, in 1999, decided to construct a two storey addition. In March 1999, the sewage system was assessed and it was determined to be insufficient in size, even to serve the existing house. Furthermore, in April it was discovered that the system was malfunctioning and, upon further analysis, it was determined that the on site constraints precluded the installation of a conventional, Code compliant, system.

Several options were considered to address the situation, including connection to existing services situated approximately 180 m from the property. In this regard a private connection would be required to run up a steep grade. Cost estimates to implement this option ran from $65,000 to $100,000, according to the Agent. It was decided that this would not be an economically feasible option for the development of the site. Further, construction of a modified Class 4 system would be difficult given the physical constraints on site. Not all of the OBC specifications could be met and concessions in this regard would be required.

The Agent advised that when his firm was retained by the owners it was concluded that a conventional system would not be the best option for this site. They proposed, instead, the use of alternative technologies and came to the conclusion that the proposed drip irrigation system would be the best alternative. While recognizing that it is not specifically described in the Code, he was confident that it could be accepted as an equivalent system.

In selecting the drip irrigation system, the Agent advised that the size and configuration of the site was considered. Because of the limited area on which to construct they have proposed to excavate the terraced areas and replace the existing soil with clean sand fill having a percolation time of 6 - 10 min/cm. He stated that the design flow for the house and addition was calculated to be 3,200 L/day and that a 6,800 L/day septic tank was proposed as part of the system. Furthermore, he emphasized that both design and construction constraints have been factored in to the installation of the proposed system and that he was confident it would operate as intended.

In terms of performance of the system the Agent offered an example of this type of installation in Nova Scotia and also provided a technical brief on the construction and performance of this type of system. He argued that these results conclude that the use of the system in cold weather climates should not be factor. He submitted that any problems associated with the system were generally a result of faulty installation or unusual weather. This, he argued, could be said of any system regulated by the Code.

In summation, the Agent stated that, in his opinion, the drip irrigation disposal system would provide an equivalent level of performance as would be anticipated by the OBC. In this regard, it meets the criteria for the acceptance of equivalents. The Agent acknowledged the City's concern that they did not have the in-house expertise to reach the same conclusion and was looking to the Building Code Commission for a ruling on this issue. Further, to allay any concerns, he offered to provide the City with a monitoring report on a regular basis for the first two years of operation.

6. <u>Respondent's Position</u>

The Designate for the Respondent submitted that the proposed drip irrigation system was an innovative technology which is not described in Part 8 of the Code. She acknowledged that the Applicant had submitted specification and technical briefs describing the detail and operation of the system but advised that the City's Building Department did not have the technical expertise to effectively evaluate the suitability of the system as an equivalent under Subsection 2.7.2. There were no recognized test procedures established or past performance data available from Canadian sources which would enable them to approve of the use of this system.

In summation, the Designate stated that, while she was sympathetic to the Applicant's situation and recognized the difficulties in developing this site, she felt unable to approve of the proposed drip irrigation system as equivalent in performance to a conventional system.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed drip irrigation leching bed sewage system does not provide sufficiency of compliance with Part 8 of the Ontario Building Code when considering the equivalency provisions found in Articles 2.7.2.1. and 2.7.2.2. at 95 Meadowcliffe Road, Toronto, Ontario.

8. Reasons

i) There is insufficient data on the performance of the drip irrigation system in Ontario and Canada. In particular the BCC has concern over the effect of suspended solids from the conventional septic tank effluent given that the emitters have very fine holes that may be susceptible to clogging.

ii) The subject property is a difficult site on which to prove the effectiveness of this innovative system. The Commission is concerned with its long term viability when considering lot size and on site conditions.

iii) The technology may be better assessed by a body such as the Building Materials Evaluation Commission

Dated at Toronto this **3rd** day in the month of **October** in the year **2002** for application number **2002-27**.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentences 8.1.2.1.(1) and 9.31.4.1.(1) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Michael Osborne, owner, for the resolution of a dispute with Doug Kopp, Chief Building Official to determine whether the as-installed Class 1 (composting toilet) and Class 2 (greywater pit) systems which serve a seasonal dwelling in lieu of a Class 4 system provide sufficiency of compliance with Sentence 8.1.2.1.(1) of the Ontario Building Code when considering Sentence 9.31.4.1.(1) at Part Lot 16, Concession 4, Township of Southgate in the County of Grey, Ontario.

APPLICANT	Michael Osborne Property owner Kitchener, Ontario
RESPONDENT	Doug Kopp Chief Building Official Township of Southgate
PANEL	Frank Wright, Chair-Designate Doug Robinson Bill Fellner
PLACE	Toronto, Ontario
DATE OF HEARING	October 3, 2002
DATE OF RULING	October 3, 2002
APPEARANCES	Michael Osborne Property owner Kitchener, Ontario **The Applicant** Doug Kopp Chief Building Official Township of Southgate **The Respondent**

RULING

1. The Applicant

Michael Osborne, owner, has applied for a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and has installed a Class 1 (composting toilet) and Class 2 (greywater pit) to service an existing mobile home at Part Lot 16, Concession 4, Township of Southgate in the County of Grey, Ontario.

2. Description of Construction

The Applicant owns a 14 acre rural property on which he has placed a mobile home intended for seasonal residential use. Mobile homes are not typically permitted for residential use by the municipal zoning by-law, however, this unit has been approved subject to a three year temporary use by-law which may or may not be extended at the discretion of the municipality. The by-law does not limit use of the unit to seasonal occupancy, however, there is no winter maintenance of the road which provides access to the property.

The mobile home unit is 110 m^2 in building area and is equipped with two sinks, one bath/shower and an Envirolet composting toilet. A Class 2, greywater system measuring 3 m by 1.5 metres and having a depth of 2 m has been constructed for the treatment and disposal of greywater. The water supply to the unit is from a well on site.

The construction in dispute involves the use of Class 1 and 2 septic systems intended to service this site. While the composting toilet and greywater pit which service the dwelling are purported to meet the requirements of Part 8 of the Building Code, Part 9 requires that a water closet be provided in a dwelling unit having a water distribution system.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the construction of Class 1 and Class 2 systems in lieu of a Class 4 septic system to serve the proposed seasonal dwelling complies with Sentence 8.1.2.1.(1), when considering Sentence 9.31.4.1.(1) of the Ontario Building Code (OBC).

Sentence 8.1.2.1.(1) classifies different types of on-site sanitary sewage systems under the OBC. Every on-site sanitary sewage system classified under the OBC has its own design, construction, installation, operation, and maintenance requirements that are regulated by the Code. A composting/incinerating toilet system and a greywater system are among the recognized sewage systems which are regulated under Part 8. These systems have been classified, respectively, as Class 1 and Class 2 systems under Sentence 8.1.2.1.(1).

Sentence 9.31.4.1.(1) states that a dwelling unit with a water distribution system must be provided with certain fixtures including a water closet. The water distribution system referred to in this sentence is defined as "an assembly of pipes, fittings,... that conveys water from the water services pipe or private water supply system (in this case a private well) to water supply outlets, fixtures, plumbing appliances, and devices". Water closets are one of the required fixtures in a dwelling unit that must be provided with a water connection as stipulated by Sentence 9.31.3.2.(2). The proposed composting toilet is not connected to a water supply system as mandated by this provision.

Greywater, on the other hand, is defined as sanitary sewage of domestic origin which is derived from fixtures other than sanitary units. A sanitary unit under the Code means a water closet, urinal, bidet or bedpan washer. Put simply, a water closet is defined as a sanitary unit that not only is connected to a water supply system, but also conducts human body waste to a sewer or private sewage system. However, a Class 2 system is a greywater system designed for effluent other than that originating from human bodies.

4. Provisions of the Ontario Building Code

Sentence 8.1.2.1. Classification of Systems

(1) All *sewage systems* shall be classed as one of the following:

(a) Class 1-- a chemical toilet, an incinerating toilet, a recirculating toilet, a self-contained portable toilet and all forms of privy including a *portable privy*, an *earth pit privy*, a *pail privy*, a *privy vault* and a composting toilet system,

(b) Class 2 -- a *greywater* system,

(c) Class 3 -- a cesspool,

(d) Class 4 -- a *leaching bed* system,

(e) Class 5 -- a system which requires or uses a *holding tank* for the retention of *hauled sewage* at the site where it is produced prior to its collection by a *hauled sewage system*,

Sentence 9.31.4.1. Required Fixtures

1) In a dwelling unit with a water distribution system, a kitchen sink, lavatory, bathtub or shower stall and water closet shall be provided.

5. Applicant's Position

The Applicant provided the Commission with some background on the issue in dispute. He advised that in 1995 he purchased the subject property on the understanding that there would be no winter maintenance of the access roadway. He also set about to overcome the municipal restrictions on the placement and siting of the mobile home on the property. In this regard a temporary use by-law was approved which is reconsidered by the municipality for renewal every three years.

Having obtained approval for the mobile home he then applied for a septic permit and a number of tests and inspections were conducted in this regard. Because of the poor drainage on site he was advised that a raised bed with an imported mantle would be required. In exploring this option he discovered that, while a normal system would reasonably cost approximately $3,500, the imported mantle system was expected to cost approximately $15,000.

The proposal was then put on hold during the winter months at which time the Applicant stated that he became aware of the Envirolet composting toilet as a means to deal with the treatment and disposal of human waste. When he approached the township with this option he was advised at the time that the composting system would be sufficient and that no permit would be required. He was also advised to contact the building department to obtain a permit for a greywater pit to handle household effluent. In 2000 he contacted the new municipality to enquire about such a permit. He then proceeded to file a permit application and construct the system to service this temporary use dwelling.

It was not until May 2002, when he approached the Township for a building permit for the construction of a pole barn that he discovered that a septic permit had not been issued for the Class 2 system and that there was also an issue about the Part 9 requirements for required facilities. The Applicant stated that, while he acknowledges the requirements in Part 9 for a Class 4 system, he believed that the Class 1 and 2 systems installed would be sufficient to service this seasonal dwelling.

The Applicant asked that the Commission consider the fact that the structure in question is a mobile home provided with only seasonal road access. He suggested that, at most, his family used the dwelling for 100 days out of the year. He stated that the composting toilet and greywater pit meet all of the Code requirements and have been installed in accordance with Ministry guidelines. He reiterated that the structure is subject to periodic review and approval by the municipality by way of the temporary use by-law and he understood that if a permanent dwelling were to be considered, a Class 4 system would be required.

In summation, the Applicant was requesting a finding of sufficiency of compliance to permit the existing Class 1 and 2 systems to continue to service the seasonal residential dwelling.

6. Respondent's Position

The Respondent submitted that his involvement in this case began in April 2000 when he was contacted about a septic permit. He provided the application documents to the Applicant who also inquired about the use of a composting toilet and greywater system for the treatment of waste. No decision was made at that time and, while he eventually did receive some more information from the Applicant in respect to composting toilets, an application for permit was never received.

The Respondent advised that in May 2002, the Applicant contacted him in respect to a request for the construction of a pole barn. The municipality's files on the property were reviewed and it was discovered that a septic permit had not been issued. He advised the Applicant of the Code provisions for required facilities where a water distribution system was in place and noted that the temporary use by-law for the property was up for review in December 2002. At that time the Applicant reiterated his request for the use of Class 1 and 2 systems.

The Respondent advised that, in his opinion, the mobile home is not a seasonal dwelling. It is winterized and could be used during this time of the year as well. He also expressed concern that, despite the Applicant's claims, there was no record of a permit application for a septic system in connection with this property. In this regard, a permit and inspection of the greywater system would be required.

In summation, the Respondent submitted that when considering the provisions of 9.31.4.1.(1), the proposal for only a composting toilet and greywater pit to serve this dwelling did not comply with all of the requirements outlined in the Code.

7. Commission Ruling

It is the decision of the BCC that the as-installed Class 1 (composting toilet) and Class 2 (greywater pit) systems serving a seasonal dwelling will provide sufficiency of compliance with Sentences 8.1.2.1.(1) and 9.31.4.1.(1) of the OBC at Part Lot 16, Concession 4 in the Township of Southgate on condition that:

a) The applicant obtain a permit for the Class 2 system based on compliance with the provisions

of Section 8.4 of the OBC.

b) The municipality is required to inspect the systems prior to any continued renewal of the temporary use by-law applicable to the subject property.

8. Reasons

i) The OBC permits class 2 septic systems for waste from sinks, showers, etc. as greywater which covers the use of facilities within the dwelling.

ii) The composting toilet produces no liquid waste and is permitted by the Code as a Class 1 system.

iii) Although there is a water distribution system in the dwelling, replacement of the water closet with a composting toilet, in this instance, will achieve sufficiency of compliance with Sentence 9.31.4.1.(1).

iv) The municipality has a temporary use by-law which allows the subject trailer to be used on the property for a period of three years at which time the municipality may review the situation and decide upon renewal of the by-law.

v) When considering the conditions imposed, the Commission is satisfied that the municipality has sufficient control over the continued use and inspection of this seasonal use.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Clauses 3.2.2.67.(2)(c) and (d) and Sentence 3.2.1.1.(8) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Frank Tozzi, Magna-MI Developments Inc., for the resolution of a dispute with Shelly Switzer, Chief Building Official to determine whether the elevated floor assembly having an area of 563.5 m^2 in a Group F, Division 2 building is considered to be a mezzanine which must comply with the provisions of Clauses 3.2.2.67.(2)(c) and (d) or whether it can be considered a service platform in conformance with the provisions of Sentence 3.2.1.1.(8) of the Ontario Building Code at the Modatek Facility, 400 Chisholm Drive, Milton, Ontario.

APPLICANT	Frank Tozzi Magna-MI Developments Inc. Aurora, Ontario
RESPONDENT	Shelly Switzer Chief Building Official Town of Milton
PANEL	Michael Steele, Vice-Chair John Guthrie Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	September 26, 2002
DATE OF RULING	September 26, 2002
APPEARANCES	Randy Brown Randal Brown & Associates Willowdale, Ontario **Agent for the Applicant** Shelly Switzer Chief Building Official Town of Milton **The Respondent**

RULING

1. The Applicant

Frank Tozzi, Magna-MI Developments Inc., has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is constructing an industrial building referred to as the Modatek Facility at 400 Chisholm Drive in the Town of Milton, Ontario.

2. Description of Construction

The Applicant is constructing a Group F, Division 2 industrial building, one storey in building height and 49,320 m^2 in building area. The structure is of noncombustible construction and will be equipped with sprinkler and fire alarm systems.

The facility contains two office mezzanines and several service platforms. In addition, there is another raised floor assembly having an area of 563.5 m^2, used to support electrical and mechanical equipment. This floor assembly has been constructed as a service platform. It is comprised of a poured concrete floor slab on steel decking and is supported on open-web steel joists which span steel beams that are supported on steel columns. The floor area is bounded on two sides by full size concrete block partition walls, a third side borders an exterior wall and the remaining side is provided with a Code compliant guard. The subject floor area is accessed by two stairways to provide the required egress from this level.

The construction in dispute involves the subject floor assembly which, as constructed, does not provide a one hour fire-resistance rating. It is considered by the Applicant to be a platform rather than a mezzanine, for which the more restrictive standard would apply.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the subject intermediate floor assembly is to be considered a mezzanine, required to comply with the provisions of Clauses 3.2.2.67.(2)(c) and (d) or whether it is a service platform in conformance with Sentence 3.2.1.1.(8) of the Ontario Building Code (OBC).

Clauses 3.2.2.67.(2)(c) and (d) outline the construction requirements for mezzanines in any sprinklered F2 building. Clause (c) specifies that mezzanines must have a fire-resistance rating of at least one hour and Clause (d) requires that loadbearing walls, columns and arches shall have a fire-resistance rating at least equal to that of the supported assembly. The subject floor assembly has been completed on the assumption that it is a service platform rather than a mezzanine, consequently, the required fire-resistance rating has not been provided.

Sentence 3.2.1.1.(8) provides that mezzanines, elevated walkways and platforms in F2 or F3 major occupancies need not be considered storeys for the purposes of calculating building height provided that a) the building is comprised of noncombustible construction, b) the intermediate floor assembly is intended for periodic service and maintenance, and c) if intended to be occupied, the occupancy be limited to no more than four persons. The subject assembly is of noncombustible construction and is intended for use by no more than four persons to periodically service and maintain the equipment located in this area.

The subject dispute, therefore, centres on whether the subject floor assembly should be considered a mezzanine, required to meet the construction parameters specific to this feature or whether, as constructed, the floor assembly represents a service platform, to be used to for the support of equipment and its periodic maintenance, as purported by the Applicant.

4. Provisions of the Ontario Building Code

3.2.2.67. Group F, Division 2, Any Height, Any Area, Sprinklered

(2) Except as permitted by Article 3.2.2.16., the *building* referred to in Sentence (1) shall be of *noncombustible construction*, and

(c) *mezzanines* shall have a *fire-resistance rating* not less 1 h, and

(d) *loadbearing* walls, columns and arches shall have a *fire-resistance rating* not less than that required for the supported assembly.

3.2.1.1. Exceptions in Determining Building Height

(8) *Mezzanines*, elevated walkways and platforms in Group F, Division 2 or 3 *major occupancies* need not be considered as *storeys* in calculating *building height* provided

(a) the *building* is of *noncombustible construction*,

(b) except for Clause (c), the *mezzanines*, elevated walkways and platforms are intended solely for periodic service and maintenance, and

(c) where they are intended to be occupied, no *mezzanine*, elevated walkway or platform shall have an *occupant load* more than 4 persons.

5. Applicant's Position

The Applicant's Agent submitted that the floor assembly in dispute has been constructed in this F2 building, as a service platform, in conformance with the provisions of Sentence 3.2.1.1.(8). As such, he advised that the area is to be used to house electrical and mechanical equipment and will be occupied by not more than four persons when servicing and maintenance is periodically required. He stated that no desks or other office furniture are to be located on this level, nor will the platform be used for storage of material. He emphasized that the area will only be occupied during maintenance operations.

The Agent suggested that the dispute has arisen as a result of the fact that the Code does not define what a constitutes a platform. Essentially, it is considered to be raised flooring and the traditional application, he submitted, would find the area housing items such as humidifiers, fans, paint booths and other industrial equipment. The Building Code, he stated, does not address how much equipment can be located on a platform, nor does it restrict platform area or make reference to whether the assembly must be free standing or can form part of the structure of the building. In his opinion, given the intended use of the space, the concept of a platform applies to this floor assembly.

In response to concerns in respect to the size of the assembly, the Agent submitted that the building itself is 50,000 m^2 and the subject platform has an area of 563.5 m^2. It is used to support electrical and mechanical equipment, the nature of which may change from time to time. He emphasized that there is no plan to use the area for storage and that the added floor space simply takes the equipment off the main floor. The Agent suggested that, if in the Commission's view, the assembly would more closely meet the concept of a platform, they could replace the stairways with vertical ladders which are frequently employed to provide access to such platforms. He emphasized, however, that this proposal

would also reduce the life safety of the area.

In respect to the claim that this area should be considered to mezzanine, the Agent argued that, unlike the other mezzanines constructed in this building, this area is not intended to be occupied on a regular basis. This level, he reiterated, will only support equipment and, therefore, does not require the fire resistance rating associated with a mezzanine. He submitted that the Applicant would offer as a condition, to include the prohibition of storage in this area in the Fire Safety Plan for the building. In addition, they would also agree to restrict access to this level by gating the top of the stairs with a lock barrier.

In summation, the Agent submitted that, despite its size and construction, the floor assembly in question serves the function of a service platform and, as constructed, meets the parameters of Sentence 3.2.1.1.(8) of the OBC.

6. Respondent's Position

The Respondent submitted that this issue is essentially one of semantics. The Code contains no definition for service "platform", but the common usage of the term applies to walkways or free standing structural platforms, accessed by ladders, which serve to raise equipment off the floor level. A service platform, he argued, is provided for the service and maintenance of equipment. This proposal, however, creates a substantial amount of floor space for the subject equipment and, as such, this floor space should be considered to be a mezzanine. The term "platform", he argued, simply does not apply to this floor assembly.

In regard to the term "mezzanine", the Respondent submitted that this is defined in the Code. A mezzanine is " an intermediate floor assembly between the floor and ceiling of any room or *storey* and includes an interior balcony". In his opinion, this level meets the definition of "mezzanine". The Respondent did not dispute the Application of Sentence 3.2.1.1.(8) and agreed that this is not a storey. His argument was that it is a mezzanine and, consequently, should be provided with a one hour fire-resistance rating as required by 3.2.2.67.(2)(c) and (d).

In summation, the Respondent reiterated that this area is not being used as a service platform. In addition, he expressed concern over potential future uses of the area and suggested that his main concern was with the protection of those working beneath the floor assembly. This area is constructed identically to the other mezzanines in the building, he argued, and should be treated as a mezzanine as well.

7. Commission Ruling

It is the decision of the Building Code Commission that the elevated floor assembly having an area of 563.5 m^2 in the subject F2 building is not considered to be a mezzanine which must comply with the provisions of Clauses 3.2.2.67.(2)(c) and (d) and can be considered to be a service platform in conformance with the provisions of Sentence 3.2.1.1.(8) of the Ontario Building Code at the Modatek Facility, 400 Chisholm Drive, Milton, Ontario subject to the following conditions:

a) The Fire Safety Plan for the Modatek Facility is required to reflect that the use of the platform be restricted to the support and service of equipment with no storage for maintenance materials permitted.

b) The platform is to be equipped with a locked barrier which will restrict access.

c) Occupant load on the platform is to be restricted to a maximum of 4 persons.

8. Reasons

i) The Ontario Building Code is not specific in respect to the definition of a service platform and the proposal, in our view, meets the intended uses and performance of a service platform.

ii) With adherence to the conditions imposed the space in question can be considered to serve the function of a service platform.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Section 3.8. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Manoj Garg, owner, Silver Mine, for the resolution of a dispute with Larry Simonato, Chief Building Official, City of Cambridge, to determine whether the proposed retail kiosk, located in a mall corridor, is required to provide barrier-free accessibility in accordance with the provisions of Sentences 3.8.1.3.(1) and 3.8.2.1.(1) of the Ontario Building Code at the Silver Mine Kiosk, Cambridge Place Mall, 355 Hespeler Street, Cambridge, Ontario.

APPLICANT	Manoj Garg, owner Silver Mine Kiosk, Cambridge Place Cambridge, Ontario
RESPONDENT	Larry Simonato Chief Building Official City of Cambridge
PANEL	Len King, Vice-Chair Fred Barkhouse Michael Steele
PLACE	Toronto, Ontario
DATE OF HEARING	September 12, 2002
DATE OF RULING	September 12, 2002
APPEARANCES	John Newell Jondy Retail Interiors Inc. Pickering, Ontario **Agent for the Applicant** Hardy Bromberg Supervisor of General Inspectors City of Cambrdige **Designate for the Respondent**

RULING

1. The Applicant

Manoj Garg, owner, Silver Mine, has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is proposing to construct a retail kiosk in a corridor of the Cambridge Place Mall, at 355 Hespeler Street, Cambridge, Ontario.

2. Description of Construction

The Applicant is proposing to construct a kiosk designed to operate as a jewellery retail outlet in one of the public corridors serving the Cambridge Place Mall. The mall itself is classified as having a Group E mercantile occupancy and is 64,351 m^2 in building area. It is one storey in building height and comprised of noncombustible construction. The building is equipped with sprinkler, fire alarm and standpipe and hose systems.

The proposed kiosk measures 3.4 m by 5.55 m (11 ft 2.5 in by 18 ft 2.5 in) and is comprised of 10 modular rectangular sections. The proposal also includes a centre island which measures 2.03 m by 0.68 m (6 ft 8 in by 2 ft 3 in) creating an interior aisle width measuring between 317.5 mm (2 ft 0.5 in) and 406.4 mm(2 ft 4 in) within the kiosk. The counter surface is situated 1016 mm (40 in) above the floor surface and is continuous around the perimeter of the kiosk. The counter is equipped with a 3 m wide lift-up flap to facilitate access into the interior or working area of the kiosk.

The construction in dispute involves the design of the subject kiosk which, as proposed, does not provide a barrier-free path of travel within the employee work area.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed retail kiosk located in a public corridor of an existing mall is required to provide barrier-free accessibility within the occupied area in accordance with Sentences 3.8.2.1.(1) and 3.8.1.3.(1) of the Ontario Building Code (OBC).

Sentence 3.8.2.1.(1) defines areas where a barrier-free path of travel is required based on occupancy classification. According to this provision, expect where essential obstructions that would exist in the "work areas" that would make a barrier-free path of travel dangerous, and except for the provision of Sentences (2), (3) and (4) of the same Article that provide a list of spaces and occupancies which are exempted from the provision of barrier-free paths of travel, all entrance storeys and occupied floor areas with a passenger elevating device that are required to have barrier-free entrances are required to provide barrier-free paths of travel. The exceptions defined and listed in Sentences 3.8.2.1.(1), (2), (3) and (4) do not apply to retail kiosks.

Following from this provision, any area that is deemed to require a barrier-free path of travel is subject to certain construction requirements. Among these requirements are those outlined in Sentence 3.8.2.3.(1) of the OBC which stipulate that a barrier-free path of travel must have an unobstructed width of at least 1060 mm for the passage of mobility challenged individuals.

The proposed retail kiosk, operating as a Group E (mercantile) occupancy, will provide aisle widths ranging from 317.5 mm (2 ft 0.5 in) and 406.4 mm (2 ft 4 in). This results from the size and location of the proposed centre island within the employee work area. The specific issue therefore, is whether, under the Ontario Building Code, the proposed retail kiosk is required to provide for barrier-free accessibility and meet the minimum established requirements for barrier-free paths of travel.

4. Provisions of the Ontario Building Code

3.8.2.1. Areas Requiring Barrier-Free Path of Travel

(1) Except where essential obstructions in the work area would make a *barrier-free* path of travel hazardous, and except as provided in Sentences (2), (3) and (4), a *barrier-free* path of travel from the entrances required by Sentences 3.8.1.2.(1) and (2) to be *barrier-free* shall be provided throughout the entrance *storey* and within all normally occupied *floor areas* served by a passenger type elevator or other platform equipped passenger elevating device.

3.8.1.3. Barrier-Free Path of Travel

(1) Except as required in Sentence (4) and except as permitted in Subsection 3.8.3., every *barrier-free* path of travel shall provide an unobstructed width of at least 1 060 mm (3 ft 6 in) for the passage of wheelchairs.

5. Applicant's Position

The Agent for the Applicant submitted that his client is intending to operate a retail jewellery kiosk in the Cambridge Place Mall. He stated that the prime objective of any retail kiosk is to generate a profit. The cost of construction and operation of the kiosk, he submitted, must be considered when evaluating whether it would be profitable to operate such a kiosk. He further suggested that the centre island proposed in this instance is an integral element of the operation of a kiosk. It is generally considered the "hub" of the business, housing the cash register and other items considered private and/or potentially hazardous. To forgo the centre island concept and redesign to provide barrier-free access would be impractical and would impact on the cost to business owners and the profitability of operating a mall kiosk, he submitted.

In support of his position that barrier-free access within the occupied area should not be required, the Agent offered the following points in relation to the operation of a retail kiosk. Firstly, he argued that an employee working in a retail kiosk, unlike a service kiosk, must be able to stand. Customers shopping and reviewing merchandise must not have their attention span broken as it may be if the person behind the counter were in a wheelchair creating a diversion by, for example, banging their chair against the interior of the kiosk. The employee of any retail kiosk, he submitted, must be able to move with the customer without distracting them. In addition, they must be able to view the merchandise from the same vantage point as the customer which, typically, is from above the counter.

Secondly, he argued that the confines of a kiosk would make it impractical for a person in a wheelchair to effectively work within that environment. He stated that the height of a kiosk counter would generally be higher than the head of most individuals in a wheelchair. Further, it would be difficult, if not impossible, for a person in a wheelchair to change directions in a Code compliant aisle that is created between the counter and the centre island. They would be forced to travel continuously in one direction, he argued. In addition, drawers and cupboards would be difficult to open within the kiosk

given the limited space available to a person in a wheelchair. Also, the physical requirements involved in retrieving merchandise, cleaning equipment placed atop the counter space and positioning of display items would be difficult if not impossible for someone requiring the use of a wheelchair for mobility, despite their level of dexterity.

As a third point in his argument, the Agent stated that the material used in the construction of a kiosk would not stand up to accidental damage that would be sustained from a wheelchair colliding with the interior of the structure. A minimum turning circle measuring 5 feet would be required to adequately accommodate a wheelchair, he submitted. In addition, other employees within the kiosk would not be able to move freely and should expect the same degree of mobility and safety as in any other retail environment. This may not occur if they were confined to a kiosk with a 42 inch aisle and working with someone in a wheelchair, he argued. In any respect, he submitted that he considered the intent of Section 3.8. to be to accommodate persons with disabilities in a manner which most respects their dignity without creating undue hardship. This would not be the case in a kiosk environment, he argued, as they are designed and built to accommodate a person of average height. It would not be profitable for kiosk designers and/or operators to cater, in all respects, to a small percentage of the population.

The Agent continued by stating that, even if you don't consider the physical impracticality of someone in a wheelchair working behind a kiosk counter, this is a mute point because a retail kiosk is not a "building" that should be subject to the provisions of the Ontario Building Code. A kiosk, he argued, is akin to a store fixture or furniture. The module compartments of a kiosk are constructed of plywood and built by a cabinet maker. This could be considered a series of interconnected bookcases, he argued. Power is provided to the unit with a floor plug, just as it would be for a lamp. In fact, many aspects of a kiosk, he submitted, are not considered by the OBC. The Code was not intended to apply to this type of fixture.

The Agent acknowledged that a retail kiosk was not listed as a use which would be excluded from the barrier-free access requirements of the Code but submitted that Section 3.8. was not written with kiosks in mind. One must look at this issue logically, he stated. When considering the physical requirements of working within a retail kiosk environment, and when further considering that this element within a mall corridor is essentially a piece of furniture, he could not comprehend how anyone could consider that this was a "building" requiring barrier-free access within the working space. In his opinion, it made sense to provide a path of travel around the fixture to accommodate customers in a wheelchair or those passing by, but to expect someone requiring the use of a wheelchair to work in a retail kiosk is ridiculous, he argued. He advised that, to his knowledge there is no one who makes use of a wheelchair working in this type of environment nor would they be hired to do so as it wouldn't be cost effective for the owner. He submitted that a retail kiosk operates quite differently from a service kiosk where the same level of mobility may not be required.

In summation the Agent submitted that, as a taxpayer, it is his view that laws were written to benefit the people. They are to be interpreted with common sense and, as far as he can tell, that has not been the case when it comes to retail kiosks. He stated that he had been advised that the Town of Cambridge had denied many similar designs causing excessive expense in the redesign process. He argued that the OBC never intended to provide the occupied area of such a structure with barrier-free accessibility. If the Commission could not make a decision based on common sense and reality, he argued, then the Ontario Building Code should be amended to reflect an exemption for retail kiosks.

6. Respondent's Position

The Designate for the Respondent submitted that in reviewing this matter he considered three issues.

Firstly, a determination was made as to whether a building permit was required. In this regard they felt that a permit was required as they considered this structure to meet the definition of "building" as set out in the *Building Code Act*. It was, he argued, a structural system serving the function of the building, therefore, it must comply with the requirements of the Building Code.

Secondly, the Designate advised that the structure was reviewed in terms of whether it was an occupancy. In this respect he submitted, a retail kiosk was considered as an occupancy functioning similarly to a retail store. In examining the occupancy requirements for this use, Section 3.8. of the OBC requires barrier-free accessibility and makes no exemption for retail kiosks.

As a third consideration in the review of this matter the municipality had regard to a previous Building Code Commission ruling in respect to a kiosk in the City of London. The BCC, in that instance, found that the kiosk must provide barrier-free accessibility and used the same logic in its conclusion that kiosks were not exempt from these Code provisions.

In summation the Designate submitted that, in his opinion a retail kiosk must provide for barrier-free accessibility within the occupied area. In response to the Applicant's claim that it is simply furniture, he argued, that the function and operation of the space as a retail outlet had to be considered. In his opinion, a permit was required and has been issued based on a kiosk design without the centre island feature. This open interior design would provide the required aisle width as determined by the Code.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed retail kiosk to be located in a mall corridor is required to provide barrier-free accessibility within the occupied area in accordance with the provisions of Sentences 3.8.2.1.(1) and 3.8.1.3.(1) of the Ontario Building Code at the Silver Mine Kiosk, Cambridge Place Mall, 355 Hespeler Street, Cambridge, Ontario.

8. Reasons

i) The kiosk is a building or portion of a building as defined by the *Building Code Act*.

ii) Kiosks are not listed as one of the areas exempted from providing a barrier-free path of travel in Article 3.8.2.1., therefore a barrier-free path of travel of the appropriate width is required.

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentences 3.2.2.9.(1) and 3.4.2.1.(1) and Articles 3.2.2.52. and 3.2.2.77. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mike Finn, Project Manager, Physical Plant Services, Queen's University, for the resolution of a dispute with Terry Willing, Chief Building Official, City of Kingston, to determine whether the subsurface (future basement) level of a proposed research facility, which will be unoccupied, unsprinklered and provided with limited access until such time as a use for the area has been determined, provides sufficiency of compliance with Sentences 3.2.2.9.(1) and 3.4.2.1.(1) and Articles 3.2.2.52. and 3.2.2.77. of the Ontario Building Code at the Cancer Research Institute, Queen's University, 18 Stuart Street, Kingston, Ontario.

APPLICANT	Mike Finn, Project Manager Physical Plant Services Queen's University Kingston, Ontario
RESPONDENT	Terry Willing Chief Building Official City of Kingston
PANEL	Len King, Vice-Chair Fred Barkhouse Michael Steele, Vice-Chair
PLACE	Toronto, Ontario
DATE OF HEARING	September 12, 2002
DATE OF RULING	September 12, 2002
APPEARANCES	Peter Colquhoun, Consultant Arencon Inc. Mississauga, Ontario **The Applicant** Ted Marecak Building Official City of Kingston **Designate for the Respondent**

RULING

1. The Applicant

Mike Finn, Project Manager, Queen's University, has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is constructing a research laboratory at Queen's University, referred to as the Cancer Research Institute, 18 Stuart Street, Kingston, Ontario.

2. Description of Construction

The Applicant is constructing a cancer research laboratory having Group F, Division 3 and Group D occupancy classifications. The structure is four storeys in building height and approximately 1,290 m^2 in building area. In addition to the four above-grade storeys, the facility includes a subsurface basement level and a mechanical penthouse. The building is comprised of noncombustible construction and will be equipped with fire alarm and standpipe and hose systems. Sprinklering is proposed for the occupied, above-grade, levels of the structure.

The subsurface level, or future basement of the building, is presently unoccupied and no use for the area has been determined. The future basement space is comprised of poured concrete walls with an unfinished, gravel floor. The height of the area, from floor to ceiling, exceeds 1,800 mm. It is proposed that ingress to the area will be limited to an access panel measuring 550 mm wide by 1,100 mm high, opening at the bottom of a stairway. Entrance to this area will be restricted to authorized personnel for the purpose of service and maintenance only. In addition, until a use for the area has been determined, there is no proposal to sprinkler the future basement level.

The construction in dispute involves the limited exit facilities from the subsurface level and the omission of a sprinkler system in the future basement for a building in which sprinklering is required. In this regard, the Applicant has proposed that, until such time as a use for the space has been determined, the area will be considered similar to that of a crawl space and will not be used for any occupancy. In addition, building services (pipes, ducts, etc.) which penetrate to the first level floor slab above the future basement will be fire stopped or protected with dampers to maintain a 45 minute fire separation.

Further, as noted above, access to the area is to be restricted to maintenance personnel in a manner consistent with the requirements for a crawl space. Also, emergency lighting and audible signal devices for the fire alarm system will be provided to the area. A manual pull station will be located beside the proposed access door and measures will be included in the building's Fire Safety Plan which will address the limitations on the use of the space.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the future basement space, which will be unoccupied, unsprinklered, and provided with limited access, until such time as a use for the area has been identified, provides sufficiency of compliance with Sentences 3.2.2.9.(1) and 3.4.2.1.(1) and Articles 3.2.2.52. and 3.2.2.77. of the Ontario Building Code (OBC).

Sentence 3.2.2.9.(1) mandates that, for the purposes of Articles 3.2.1.4. and 3.2.1.5., a crawl space shall be considered to be a basement if it a) exceeds 1,800 mm between the lowest part of the floor assembly and the ground or other surface below, b) is used for any occupancy, c) is used for the passage of flu pipes or, d) is used as a plenum in combustible construction. In the subject building, while the disputed

area is acknowledged to be a future basement, it presently has many of the characteristics of a crawl space, as purported by the Applicant. It is not presently intended to be used for any occupancy. In addition, it is proposed that building services (pipes, ducts, etc.) which penetrate to the first level floor slab above the future basement will be fire stopped or protected with dampers to maintain a 45 minute fire separation. However, it's height (as noted above) exceeds 1,800 mm.

A further requirement for the basement area, outlined in Sentence 3.4.2.1.(1) of the Code, addresses the minimum number of required exits from a floor area. In this regard, with exceptions not applicable here, every floor area which is intended for occupancy shall be served by a minimum of two exits. The future basement of the subject building, for which a use has not been determined and which will remain unoccupied until such time as such determination has been made, is provided with one exit panel measuring 550 mm by 1,100 mm to provide limited access for servicing and maintenance.

In addition, the subject four storey high building having both Group D and F3 major occupancies falls under the construction requirements for Articles 3.2.2.52. and 3.2.2.77., respectively. These Articles require the building (including the basement) to be sprinklered, comprised of either noncombustible or combustible construction and establish the required fire resistance ratings in accordance with Part 3 of the Code. In respect to the subject building, while all occupied areas are intended to be equipped with a sprinkler system, no sprinklering is presently proposed for the basement level until a use or occupancy has been determined. Following such a determination, it is intended by the Applicant that a sprinkler system will be designed to accommodate the intended use and floor layout.

To achieve sufficiency of compliance with the Code requirements for this space, the Applicant has suggested that the area can be considered, temporarily, to be a crawl space. They have offered to ensure that access to the area is restricted to authorized personnel. Emergency lighting, audible fire alarm devices and a manual pull station near the proposed access panel door will also be provided and the limitations on use of the space will be specified in the Fire Safety Plan for the building. All well, the Applicant has committed that sprinklering and the required exits will be provided once a use for the space has been determined.

4. Provisions of the Ontario Building Code

3.2.2.9. Crawl Spaces

(1) For the purposes of Articles 3.2.1.4. and 3.2.1.5., a crawl space shall be considered as a *basement* if it is

(a) more than 1 800 mm (5 ft 11 in) high between the lowest part of the floor assembly and the ground or other surface below,
(b) used for any *occupancy*,
(c) used for the passage of *flue pipes*, or
(d) used as a *plenum* in *combustible construction*.

3.4.2.1. Minimum Number of Exits

(1) Except as permitted by Sentences (2) to (4) and (6), every *floor area* intended for *occupancy* shall be served by at least 2 *exits*.

3.2.2.52. Group D, up to 4 Storeys, Sprinklered

(1) A *building* classified as Group D is permitted to conform to Sentence (2) provided

(a) except as permitted by Sentence 3.2.2.7.(1), the *building* is *sprinklered*,

(b) it is not more than 4 *storeys* in *building height*, and

(c) it has a *building area* not more than 3 600 m^2 (38,800 ft^2).

(2) The *building* referred to in Sentence (1) is permitted to be of *combustible construction* or *noncombustible construction* used singly or in combination, and

(a) floor assemblies shall be *fire separations* with a *fire-resistance rating* not less than 1 h,

(b) *mezzanines* shall have a *fire-resistance rating* not less than 1 h, and

(c) *loadbearing* walls, columns and arches shall have a *fire-resistance rating* not less than that required for the supported assembly.

3.2.2.77. Group F, Division 3, up to 4 Storeys, Sprinklered

(1) A *building* classified as Group F, Division 3 is permitted to conform to Sentence (2) provided

(a) except as permitted by Sentence 3.2.2.7.(1), the *building* is *sprinklered*,

(b) it is not more than 4 *storeys* in *building height*, and

(c) it has a *building area* not more than

(i) 14 400 m^2 (155,000 ft^2) if 1 *storey* in *building height,*

(ii) 7 200 m^2 (77,500 ft^2) if 2 *storeys* in *building height*,

(iii) 4 800 m^2 (51,700 ft^2) if 3 *storeys* in *building height*, or

(iv) 3 600 m^2 (38,800 ft^2) if 4 *storeys* in *building height*.

(2) The *building* referred to in Sentence (1) is permitted to be of *combustible construction* or *noncombustible construction* used singly or in combination, and

(a) floor assemblies shall be *fire separations* and, if of *combustible construction*, shall have a *fire-resistance rating* not less than 45 min,

(b) *mezzanines* shall have, if of *combustible construction*, a *fire-resistance rating* not less than 45 min, and

(c) *loadbearing* walls, columns and arches supporting an assembly required to have a *fire-resistance rating* shall

(i) have a *fire-resistance rating* not less than 45 min, or

(ii) be of *noncombustible construction*.

5. Applicant's Position

The Applicant's Agent advised that, in respect to the subject future basement space, it was the University's desire to defer sprinklering of the area until such time as a use for the space had been decided upon. At present, he advised, a diverse range of uses are being contemplated however, there is no firm plan in place for any specific occupancy at this time. Consequently, it is anticipated that any sprinkler system put in place now could require extensive alteration, depending on the future occupancy involved. Omitting the sprinkler system at this time would save the university the additional cost required to upgrade and reconfigure the system at a later date. It is more cost effective, he argued, to design a system for a specific use relative to the varying hazards involved.

The Agent submitted that this future basement presently functions as a crawl space. It is unoccupied, provided with limited access and houses a sump pump/storm drain which may require periodic servicing. He argued that, although the term "crawl space" is not defined in the Code that it is generally considered to be a low or narrow space below the lower storey of a building which can be accessed for servicing and maintenance. With the exception of the floor to ceiling height, the subject space qualifies in all other respects as a crawl space. As such, no sprinklering would be required and only limited access need be provided.

In reference to the issue of access to the area, the Agent advised that a small door is being proposed to permit authorized personnel to gain entry for servicing and maintenance when required. He also submitted that it is not the university's intent to use this area for storage of any kind. He emphasized that, once a use has been determined, the future basement would be made to comply with all Code requirements.

In response to any concerns about the use of this space the Agent advised that written confirmation was offered to the municipality to ensure that access to the area would be restricted and a limited number of keys would be issued to authorized individuals. In addition, an undertaking would be provided to ensure that the area would not be used for storage or otherwise until such time as a use had been established. He also advised that the Fire Department was invited to conduct random, unscheduled, inspections to assure that the space was not being used inappropriately. These proposals, however, had been rejected by the Respondent.

The Agent submitted that they are seeking a ruling in respect to the sufficiency of compliance of their proposal with the disputed provisions of the Building Code. As compensation for the period of noncompliance while the space is unoccupied, the Agent advised that certain compensating measures were being offered. These measures include a) consideration that the future basement presently functions as a crawl space, b) pipes which would penetrate the upper floor assembly will be fire stopped to maintain the fire separation between the two levels, c) sufficient emergency and normal lighting, together with exit signs will be provided in the area (this is not normally required for a crawl space), d) audible devices connected to the fire alarm system will be maintained and a pull station will be located at the bottom of the stair in which the access door is located, and e) the basement is enclosed in noncombustible construction and will not be used for any occupancy. In addition he noted, these measures would be included in the Fire Safety Plan for the building ensuring that all provisions would be adhered to.

In summation, the Agent argued that the present proposal represented the most responsible and effective use of public and donor funds made available to the university. He emphasized that, the space presently serves as a crawl space and suggested that if the ceiling were lowered, it would meet all of the parameters associated with such a feature. Sprinklering of the area and the concealed space above the lowered ceiling would, therefore, not be required. He further reiterated that, once a use had been determined a building permit would be applied for and full compliance ensured.

6. <u>Respondent's Position</u>

The Designate for the Respondent submitted that, in his opinion, the issue was fairly clear. Compliance with the provision of the Building Code requires that the basement be sprinklered and that two exits be provided. He suggested that the proposal for noncompliance was a result of financial concerns rather than design limitations. There are no provisions in the Code, he argued, that would permit this space to be left unsprinklered.

The Designate noted that, although the space was presently unoccupied, it was still accessible and did not meet the accepted concept of a crawl space. Further, he disputed the claim that the area would not be used for storage in the interim period until a use had been determined. The offer to permit random inspections, he suggested, put the onus on the municipality to ensure that the space was not being utilized. In his opinion, this would not offer the same level of protection anticipated by the Code. The Designate also disputed the Applicant's claim that the required sprinkler system would have to be totally redesigned or replaced depending on the use of the area. He conceded that some reconfiguration may be required but didn't feel it would be as extensive or costly as was being claimed.

In terms of the present lack of occupancy for the area, the Designate submitted that, when examining the minimum construction requirements for an unoccupied building, the Code still applies. It is standard practice to require compliance whether floor space is occupied or not. The omission of sprinklering in this instance also raises concerns about protection of this floor while construction occurs. In addition, he noted the allowance in NFPA to avoid sprinklering of a conceled space but argued that it does not apply here. The basement is an accessible area and not a concealed space.

In summation, the Designate stated that the Code is clear in respect to what is required for a basement in this instance. This space meets the definition of a "basement" as determined by the Ontario Building Code and, therefore, should be constructed by meeting all Code requirements.

7. Commission Ruling

It is the decision of the Building Code Commission that the subsurface (future basement) level of the proposed research facility, which will be unoccupied, unsprinklered and provided with limited access until such time as a use for the area has been determined, does not provide sufficiency of compliance with Sentences 3.2.2.9.(1) and 3.4.2.1.(1) and Articles 3.2.2.52. and 3.2.2.77. of the Ontario Building Code at the Cancer Research Institute, Queen's University, 18 Stuart Street, Kingston, Ontario.

8. Reasons

i) When considering the provisions of Sentence 3.2.2.9.(1), the subsurface level is a basement, as defined by the Code, and is not considered to be a crawl space.

ii) Articles 3.2.2.52. and 3.2.2.77. require the building, including the basement area, to be sprinklered.

iii) Sentence 3.4.2.1(1) requires that two exits be provided from the basement floor space.

iv) The compensating measures being offered are not adequate to achieve sufficiency of compliance with the provisions of the Code, despite the area being presently unoccupied and provided with limited access.

Dated at Toronto this **12th** day in the month of **September** in the year **2002** for application number **2002-24**.

Application No. 2002-21

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Article 9.30.1.2 of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Dave de Sylva, Del Ridge Homes Inc., for the resolution of a dispute with Shelly Switzer, Chief Building Official, Town of Milton, to determine whether the prefinished hardwood flooring proposed for the kitchen of a single detached residential building provides sufficiency of compliance with Article 9.30.1.2. of the Ontario Building Code at 319 Malick Street, Milton, Ontario.

APPLICANT	Dave de Sylva Del Ridge Homes Inc. Markham, Ontario
RESPONDENT	Shelly Switzer Chief Building Official Town of Milton
PANEL	Kenneth Peaker, Chair Fred Barkhouse Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	August 8, 2002
DATE OF RULING	August 8, 2002
APPEARANCES	Dave de Sylva Del Ridge Homes Inc. Markham, Ontario **The Applicant** Shelly Switzer Chief Building Official Town of Milton **The Respondent**

RULING

1. The Applicant

Dave de Sylva, Del Ridge Homes Inc., has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is constructing a residential dwelling unit at 319 Malick Street, Milton, Ontario.

2. Description of Construction

The Applicant is constructing a single detached dwelling having a Group C occupancy classification. The structure has a building area of 134.7 m^2 and a building height of two storeys.

The construction in dispute involves the type of finished flooring proposed for the kitchen of the dwelling. The proposed kitchen flooring will be comprised of prefinished oak planks having a factory applied urethane finish to the top of the wood strip. The sides, ends and bottom of the hardwood strips are left unfinished. Asphalt paper or wax paper is proposed for use between the hardwood product and the subfloor. The paper is designed to protect the hardwood from moisture penetration originating from beneath the subfloor and additionally, protects the subfloor should water permeate from above.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the prefinished hardwood flooring proposed for the kitchen of a single detached dwelling provides sufficiency of compliance with Article 9.30.1.2. of the Ontario Building Code (OBC).

This Article of the Code deals with water resistance and finished floor coverings. It provides a list of acceptable water resistant finished floorings for bathrooms, kitchens, public entrance halls, laundry and general storage areas. The list includes "felted-synthetic-fibre floor coverings, concrete, terrazzo, ceramic tile and mastic...". It also states that other types of flooring are permitted provided that they offer "a similar degree of water resistence".

It is proposed in this instance that the kitchen floor in a residential dwelling be covered with a prefinished hardwood product. While not specifically listed in Article 9.30.1.2., the Applicant contends that this type of flooring will provide "a similar degree of water resistence" within a kitchen environment and, therefore, sufficiency of compliance with Article 9.30.1.2. will be achieved.

4. Provisions of the Ontario Building Code

Article 9.30.1.2 Water Resistence

(1) Finished flooring in bathrooms, kitchens, public entrance halls, laundry and general storage areas shall consist of resilient flooring, felted-synthetic-fibre floor coverings, concrete, terrazzo, ceramic tile, mastic or other types of flooring providing similar degrees of water resistance. (See Appendix A.)

5. Applicant's Position

The Applicant submitted that, while it is recognized that the subject application applies to only one property, the issue of hardwood floors for kitchens could have a far reaching impact. In fact, for this particular subdivision alone, a number of requests for hardwood flooring in the kitchen have been received from prospective purchasers. Other municipalities, he argued, already accept its use for this area and approve of the installation. Some, however, will permit hardwood in kitchens only if the owner signs a waiver that indemnifies the municipality, the builder and the New Home Warranty Program from any responsibility if water damage should occur. This type of waiver has been offered in this case but the municipality has chosen not to accept the proposal.

In respect to the appropriateness of using hardwood flooring in the kitchen of a dwelling, the Applicant submitted that the Code provision in dispute was written out of concern for permeability of the finished flooring and prospective damage to the subfloor from water penetration. He argued that the prefinished hardwood plank being proposed for use is not a permeable material. He suggested that the only area of concern could be at the plank joints and stated that these areas are tightly connected. He argued that material such as ceramic tile was also jointed and that the masonry used in that application could shrink, letting water through to the subfloor. The key to ensuring that the flooring functions as designed is to provide quality hardwood product install as per the manufacturers specifications.

The Applicant submitted that based on permeability tests conducted for the proposed prefinished hardwood, he was confident that the product would perform as desired when used in the kitchen of a detached dwelling. The factory applied finish, he submitted, would exclude water vapour. In addition, if installed as recommended by the manufacturer and by using either asphalt paper or wax paper between the hardwood flooring and the subfloor, he submitted that a similar degree of water resistance will be offered when compared to Code specified products.

6. Respondent's Position

The Respondent submitted that, as a municipal official, his mandate is to enforce the Ontario Building Code. In this respect, he argued, he had no luxury to accept the waiver or release from responsibility being offered by the Applicant.

He advised the Commission that the National Building Code (NBC) would permit the type of prefinished hardwood flooring anticipated in this application however, an impermeable layer would be required between the subfloor and installed product. He further submitted that, if the Commission were to rule in favour of allowing hardwood flooring in kitchens, he would be more comfortable accepting the ruling if a similar condition were imposed in respect to installation.

In summation, the Respondent submitted that in his interpretation of Article 9.30.1.2, hardwood flooring is not a permitted material for installation in the kitchen of a residential dwelling. He, therefore, looks to the Commission for a ruling on whether the flooring will achieve sufficiency of compliance with the provisions of the OBC.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed prefinished hardwood flooring in the kitchen of a single detached residential building provides sufficiency of compliance with Article 9.30.1.2. of the Ontario Building Code 319 Malick Street, Milton, Ontario, on condition that:

a) The product must be supplied with a urethane finish having a minimum of seven (7) coats applied under factory conditions.

b) The flooring must be installed in accordance with the manufacturers recommendations.

8. Reasons

i) This application is restricted to the kitchen only of a Group C residential dwelling constructed under Part 9 of the Ontario Building Code. The use of prefinished hardwood flooring in bathrooms, laundry areas, etc., where the incidence of standing water may be more frequent, has not been considered.

ii) When considering the conditions imposed in this decision, the type of flooring anticipated for use in the kitchen, will provide a similar degree of water resistence as that anticipated by Article 9.30.1.2.

Dated at Toronto this **8th** day in the month of **August** in the year **2002** for application number **2002-21**.

AND IN THE MATTER OF Article 9.30.1.2 of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Robert Marini, Mattamy Homes, for the resolution of a dispute with Shelly Switzer, Chief Building Official, Town of Milton, to determine whether the prefinished hardwood flooring proposed for the kitchen of a single detached residential building provides sufficiency of compliance with Article 9.30.1.2. of the Ontario Building Code at Lot 116, Trudeau Dive, Milton, Ontario.

APPLICANT	Robert Marini Mattamy Homes Oakville, Ontario
RESPONDENT	Shelly Switzer Chief Building Official Town of Milton
PANEL	Kenneth Peaker, Chair Fred Barkhouse Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	August 8, 2002
DATE OF RULING	August 8, 2002
APPEARANCES	Robert Marini, Mattamy Homes Oakville, Ontario **The Applicant** Shelly Switzer Chief Building Official Town of Milton **The Respondent**

RULING

1. The Applicant

Robert Marini, Mattamy Homes, has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is constructing a residential dwelling at Lot 116, Trudeau Dive, Milton, Ontario.

2. Description of Construction

The Applicant is constructing a Group C residential dwelling having a building area of 217 m^2 and a building height of 2 storeys. The structure is comprised of combustible construction and is part of a new subdivision within the Town of Milton.

The construction in dispute involves the type of finished flooring proposed for the kitchen of the dwelling. The proposed kitchen flooring will be comprised of prefinished hardwood strips having a factory applied urethane finish to the top of the wood strip. The sides, ends and bottom of the hardwood strips are left unfinished. Installation of the product will include a wax paper layer beneath a vapour barrier material installed between the subfloor and the hardwood product. The paper is designed to protect the hardwood from moisture penetration originating from beneath the subfloor and additionally, protects the subfloor should water permeate from above.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the prefinished hardwood flooring proposed for the kitchen of a single detached dwelling provides sufficiency of compliance with Article 9.30.1.2. of the Ontario Building Code (OBC).

This Article of the Code deals with water resistance and finished floor coverings. It provides a list of acceptable water resistant finished floorings for bathrooms, kitchens, public entrance halls, laundry and general storage areas. The list includes "felted-synthetic-fibre floor coverings, concrete, terrazzo, ceramic tile and mastic...". It also states that other types of flooring are permitted provided that they offer "a similar degree of water resistence".

It is proposed in this instance that the kitchen floor in a residential dwelling be covered with a prefinished hardwood product. While not specifically listed in Article 9.30.1.2., the Applicant contends that this type of flooring will provide "a similar degree of water resistence" within a kitchen environment and, therefore, sufficiency of compliance with Article 9.30.1.2. will be achieved.

4. Provisions of the Ontario Building Code

Article 9.30.1.2 Water Resistence

(1) Finished flooring in bathrooms, kitchens, public entrance halls, laundry and general storage areas shall consist of resilient flooring, felted-synthetic-fibre floor coverings, concrete, terrazzo, ceramic tile, mastic or other types of flooring providing similar degrees of water resistance. (See Appendix A.)

5. Applicant's Position

The Applicant informed the Commission that the issue in dispute is the proposed use of hardwood flooring in the kitchen of a Group C dwelling. Relief is being sought under Part 9 of the Code for a finding of sufficiency of compliance to use this type of flooring when considering the intent of Article 9.30.1.2.

The Applicant submitted that, when considering the type of owner-occupied Group C building contemplated here, there is a vested interest by the occupants respecting the upkeep of the dwelling. The anticipated level of upkeep would be different, he suggested, if considering other occupancy types where maintenance may not be undertaken by the owners of the building. He further submitted that the request for relief was in relation to the kitchen area only. He acknowledged that the use of hardwood may not be as appropriate for a bathroom or laundry area where the incidence of water usage and occurrence of standing water may be increased.

In respect to the proposed product to be installed he submitted that the prefinished wood flooring will have a seven coat, factory applied finished on which the manufacturer provides a 25-year guarantee on the finish. The finish, he argued, does not allow for water penetration. The ends of the wood strip are unfinished but with proper installation where the floor boards are butted tightly together, water absorption would generally not be an issue unless there were extended periods of standing water. The manufacturer of the hardwood product has written in support of the application of wood flooring in kitchens and indicated that, in over 30 years of operation, no record of a claim in respect to mold or bacteria related issues has ever been reported. Any claims for wood rot were always related to long-term leaks that had developed. The Applicant further argued that wood flooring was the dominant covering in all homes up until the mid-sixties. Furthermore, the covering at that time was generally a wax finish which does not protect the wood nearly as well as the finishes today.

In respect to the concern regarding the protection of the subflooring, the Applicant submitted that, in their experience, "any tile floor or seamed vinyl floor over time may develop cracks in the grout joint or cuts in the vinyl. In these cases any moisture that may spill on the floor, that is not immediately addressed, will pass through the scratch coat and may compromise the flooring and the subfloor." It was their position that a properly installed prefinished wood floor would perform as well in the kitchen as a properly installed tile of vinyl floor.

In summation, the Applicant reiterated their position that, given the durability and degree of water resistance expected from the prefinished hardwood product proposed, sufficiency of compliance with the provisions of the OBC as they relate to kitchens in a Group C dwelling will be achieved.

6. Respondent's Position

The Respondent submitted that the requirements outlined in the building Code, in his opinion, would not permit hardwood flooring in a residential kitchen. He stated that the prescriptive wording restricts the type of flooring that could be considered acceptable.

He advised the Commission that the National Building Code (NBC) would permit the type of prefinished hardwood flooring anticipated in this application however, an impermeable layer would be required between the subfloor and installed product. He further submitted that, if the Commission were to rule in favour of allowing hardwood flooring in kitchens, he would be more comfortable accepting the ruling if a similar condition were imposed in respect to installation.

In summation, the Respondent submitted that in his interpretation of Article 9.30.1.2, hardwood flooring is not a permitted material for installation in the kitchen of a residential dwelling. He, therefore, looks to the Commission for a ruling on whether the flooring will achieve sufficiency of compliance with the provisions of the OBC.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed prefinished hardwood flooring in the kitchen of a single detached residential building provides sufficiency of compliance with Article 9.30.1.2. of the Ontario Building Code at Lot 116, Trudeau Dive, Milton, Ontario, on condition that:

a) The product must be supplied with a urethane finish having a minimum of seven (7) coats applied under factory conditions.
b) The flooring must be installed in accordance with the manufacturers recommendations.

8. Reasons

i) This application is restricted to the kitchen only of a Group C residential dwelling constructed under Part 9 of the Ontario Building Code. The use of prefinished hardwood flooring in bathrooms, laundry areas, etc., where the incidence of standing water may be more frequent, has not been considered.

ii) When considering the conditions imposed in this decision, the type of flooring anticipated for use in the kitchen, will provide a similar degree of water resistence as that anticipated by Article 9.30.1.2.

Dated at Toronto this **8th** day in the month of **August** in the year **2002** for application number **2002-20**.

Application No. 2002-19

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentences 3.3.1.2.(3), 3.2.2.43.(2), 3.2.2.16.(1) and 3.1.5.3.(2) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Pat Caulfield, Queen's University, for the resolution of a dispute with Terry Willing, Chief Building Official, City of Kingston, to determine whether the proposed natural gas fireplaces to be located in the Fireplace Lounges, which constitute extensions of public corridors leading to exits in sites 1 and 3, provide sufficiency of compliance with Sentence 3.3.1.2.(3), and whether the proposed use of glued-laminated heavy timber beams and purlins as well as plywood sheathing for attachment of copper roofing in the construction of the roof assembly of the fireplace lounge in site 3, provides sufficiency of compliance with Sentences 3.2.2.43.(2), 3.2.2.16.(1) and 3.1.5.3.(2) of the Ontario Building Code at the Student Residence Buildings for Queen's University, 23 Albert Street (site 1) and 194 Stuart Street (site 3), Kingston, Ontario.

APPLICANT	Pat Caulfield Queen's University Kingston, Ontario
RESPONDENT	Terry Willing Chief Building Official City of Kingston
PANEL	Len King, Vice-Chair John Guthrie Gary Burtch
PLACE	Toronto, Ontario
DATE OF HEARING	August 1, 2002
DATE OF RULING	August 1, 2002
APPEARANCES	Peter Colquhoun, Consultant Arencon Inc. **Agent for the Applicant** Ted Marecak Building Official City of Kingston **Designate for the Respondent**

RULING

1. The Applicant

Pat Caulfield, Construction Manager, Queen's University, has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is constructing two new student residence buildings at Queen's University, 23 Albert Street (site 1) and 194 Stuart Street (site 3), Kingston, Ontario.

2. Description of Construction

The Applicant is constructing two buildings having Group C occupancy classifications and intended for use as student residences in conjunction with Queen's University. The buildings, referred to as site 1 and site 3, have building areas of 1,288 m^2 and 2,906 m^2 respectively. The site 1 structure is 6 storeys in building height and the site 3 building reaches 5 storeys in building height. Both structures also include mechanical penthouses. The buildings are comprised of noncombustible construction and are equipped with sprinkler, standpipe and hose and fire alarm systems.

The two buildings are being constructed concurrently and share certain design features such as resident room layouts, amenity spaces and construction techniques. As part of the design of both structures, lounge areas have been provided in the one storey portions of the buildings. These lounges, termed fireplace lounges, are open to the adjacent public corridors and are intended to include a natural gas fireplace as an amenity feature for the residents.

There are three items of construction in dispute, one of which is common to both buildings. The common dispute involves the provision of natural gas fuelled fireplaces in the fireplace lounges of both residences. The lounges are situated on the ground floor of each building and are open to the adjacent public corridor which provides access to exits. To address concerns with allowing a fuel fired appliance in an access to exit, the following measures have been offered by the Applicant.

- "Provision of an automatic shut off of the fuel supply to the fireplace on activation of the fire alarm system,
- An enclosure (e.g. glass doors) that will prevent the occupants from coming in contact with the open flame,
- Carbon monoxide detectors, connected to the building fire alarm system, will be provided in each Fireplace Lounge, between the fireplace and the main circulation area of the public corridor,
- The buildings are sprinklered throughout and the sprinkler systems are supervised by the building fire alarm system,
- The fireplaces will be controlled by a thermostat in each Fireplace Lounge that will limit temperature in the fireplace lounges as a result of operation of the fireplace,
- Choices of exits are available for the public corridor and from the Fireplace Lounges that do not pass close to the fireplaces, and
- The fireplaces are located at the most remote points of the Fireplace Lounges from the main circulation area of the public corridors leading to the exits serving the Ground Floors of the buildings."

The second and third items of construction in dispute are particular to the site 3 building. In this regard, it is proposed that glued-laminated (glu-lam) heavy timber beams and purlins will be used to support a roof assembly consisting of a metal roof deck, insulation, Z girts supporting a nailing surface and

copper sheet roofing, in the construction of the fireplace lounge pavilion. The proposed beams would exceed the minimum size requirements outlined in the Code and, according to the Applicant, will provide a heavy timber alternative to a 45 minute fire resistance rating in lieu of the nonrated, noncombustible assembly which would be permitted by the Code. The fireplace lounge pavilion is a one storey portion of the building which will be separated from the adjacent upper storeys by 1.5 m to the south and 3 m to the north. Further, sprinklering of the pavilion will exceed the minimum requirements of NFPA13.

The final item of construction in dispute, again particular to the site 3 building, involves the use of 19 mm exterior grade plywood as a nailing surface for the copper sheet horizontal seam roof proposed for the fireplace lounge pavilion. To compensate for the use of this combustible plywood roof sheathing the Applicant is proposing the installation of a thermal barrier consisting of 16 mm thick water resistant gypsum board above the metal deck and below the rigid insulation and plywood sheathing. Further, fast response sprinklers are to be installed with deflectors to within 150 mm of the underside of the ceiling.

3. Dispute

The dispute between the Applicant and Respondent is threefold. The first issue involves whether the gas fuelled fireplaces located in the fireplace lounges, which constitute extensions of the public corridors, provide sufficiency of compliance with Sentence 3.3.1.2.(3) of the Ontario Building Code (OBC). Secondly, at issue is whether the use of glued-laminated heavy timber beams and purlins in the roof framing of the fireplace lounge of the site 3 building provides sufficiency of compliance with Sentences 3.2.2.43.(2) and 3.2.2.16.(1). And lastly, at dispute is whether the use of plywood sheathing as a nailing surface for the proposed copper sheet roofing will provide sufficiency of compliance with Sentence 3.1.5.3.(2) of the OBC.

In respect to the proposal to include gas fuelled fireplaces within the lounge areas of the site 1 and 3 buildings, Sentence 3.3.1.2.(3) states that a fuel-fired appliance shall not be located in a corridor serving as an access to exit. As noted, the lounge areas of both buildings are considered to be extensions of the public corridors which provide access to exits. As discussed above, however, certain measures of compensation are being offered to address concerns with the proposal and achieve sufficiency of compliance with the requirements of the Code. These measures include the provision of an automatic shut off feature and carbon monoxide detectors (both of which would be activated by the fire alarm system), and enclosure of the fireplace opening, etc.

On the second issue, Sentence 3.2.2.43. which governs the construction of buildings up to six storeys in building height and containing a Group C occupancy, stipulates that such buildings shall be of noncombustible construction and specifies the fire resistance ratings for floor assemblies and mezzanines. In addition, Sentence 3.2.2.16.(1) permits the use of heavy timber beams in the roof assembly of buildings up to two storeys in building height if sprinklering is provided. The subject site 3 building proposes the use of glu-lam heavy timber beams and purlins in the construction of the fireplace lounge roof assembly. The size of the proposed heavy timber beams and purlins will exceed the minimum size requirements outlined for such materials in the Code and would, arguably, provide the equivalent of a 45 minute fire resistance rating, whereas a nonrated, noncombustible assembly would be permitted.

Lastly, Sentence 3.1.5.3.(2), applicable to the project for its proposed use of combustible roofing materials, provides that combustible roof sheathing and supports installed above a **concrete** (emphasis added) deck are permitted, upon condition, in buildings required to be of noncombustible construction.

As noted above, the Applicant is proposing the use of a plywood sheathing above a metal deck for the purposes of providing a nailing base for the attachment of copper sheet roof materials. To compensate for deviation from the requirements of the Code in this regard, the Applicant is proposing the installation of a thermal barrier between the deck and the sheathing as well as the use of quick response sprinkler heads with deflectors positioned within 150 mm from the ceiling.

4. Provisions of the Ontario Building Code

3.3.1.2. Hazardous Substances, Equipment and Processes

(3) A fuel-fired *appliance* shall not be installed in a corridor serving as an *access to exit*.

3.2.2.43. Group C, up to 6 Storeys

(2) The *building* referred to in Sentence (1) shall be of *noncombustible construction*, and

(a) except as permitted by Sentence (3), floor assemblies shall be *fire separations* with a *fire-resistance rating* of not less than 1 h,

(b) *mezzanines* shall have a *fire-resistance rating* of not less than 1 h,

(c) if the *building* is not *sprinklered*, roof assemblies shall have a *fire-resistance rating* not less than 1 h, and

(d) *loadbearing* walls, columns and arches shall have a *fire-resistance rating* not less than that required for the supported assembly.

3.2.2.16. Heavy Timber Roof Permitted

(1) Unless otherwise permitted by Articles 3.2.2.20. to 3.2.2.83., a roof assembly in a building up to 2 *storeys* in *building height* is permitted to be of *heavy timber construction* regardless of *building area* or type of construction required, provided the *building* is *sprinklered*.

3.1.5.3. Combustible Roofing Materials

(2) *Combustible* roof sheathing and roof sheathing supports installed above a concrete deck are permitted on a *building* required to be of *noncombustible construction* provided

(a) the concrete deck is not less than 50 mm (2 in) thick,

(b) the height of the roof space above the deck is not more than 1 000 mm (3 ft 3 in),

(c) the roof space is divided into compartments by fire stops in conformance with Article 3.1.11.5.,

(d) openings through the concrete deck other than for *noncombustible* roof drains and plumbing piping are protected by masonry or concrete shafts

(i) constructed as *fire separations* having a *fire-resistance rating* not less than 1 h, and

(ii) extending from the concrete deck to not less than 150 mm (5⅞ in) above the adjacent roof sheathing,

(e) the perimeter of the roof is protected by a *noncombustible* parapet extending from the concrete deck to not less than 150 mm (5⅞ in) above the adjacent sheathing, and

(f) except as permitted by Clause (d), the roof space does not contain any *building* services.

5. Applicant's Position

The Agent for the Applicant stated that there are three areas of construction in dispute in the

construction of the two new student residences. He submitted that all issues were particular to the proposed fireplace lounges included in the design and layout of the subject buildings.

In outlining the first issue in dispute, the Agent stated that the Applicant is proposing the installation of natural gas fireplaces in the fireplace lounges. He noted that these lounges, while distinct in their function, were open to the adjacent public corridors serving as access to exits. The Agent acknowledged the position of the municipality in this regard and advised that, to address any concern in this regard and to achieve sufficiency of compliance, he was proposing certain compensating measures.

As part of the proposal, the Agent advised that the fireplaces would be provided with a shut off valve which would cut off the natural gas supply to the units when the fire alarm system is activated. Further, carbon monoxide detectors are proposed in the lounges which would also be activated by the fire alarm system. It is also intended that the fireplace openings will be enclosed in glass and that thermostats will limit the temperature in the lounge areas. He further noted that the fireplaces themselves were to be situated at the farthest point from the path of travel through the public corridors. These measures, he argued, demonstrated sufficiency of compliance with the provisions of the Code and were also consistent with measures included in two previous Building Code Commission Rulings approving of similar proposals.

In respect to the second issue in dispute, the Agent advised that glu-lam heavy timber beams and purlins were being proposed in the construction of the roof assembly of the fireplace lounge pavilion at site 3. These beams, he stated, will exceed the minimum size requirement dictated by the Code and will provide the equivalent of a 45 minute fire resistance rating. He suggested that this is an improvement over what would be permitted by the Code, including nonrated noncombustible assemblies.

In addition to the timber support assembly being proposed in the fireplace lounge pavilion, the Agent advised that they are intending to apply copper sheet roofing to this one storey portion of the site 3 residence. This material, he argued, ideally requires a plywood nailing base to allow for proper installation. He acknowledged that the plywood sheathing was not listed in the Code as an acceptable material for use in a building required to be of noncombustible construction and, as a result, is offering compensation in this regard.

To address concerns in respect to the use of the plywood sheathing, the Agent noted that a thermal barrier was being proposed on top of the metal deck and below the insulation and sheathing. This barrier, he argued, was not required by the Code. He further noted that the sprinkler protection in the fireplace lounge will exceed the requirements of NFPA13 and advised that quick response sprinkler heads equipped with deflectors were to be installed within 150 mm of the underside of the finished ceiling. These protective measures, he submitted, would provide sufficiency of compliance with the safety requirements anticipated by the OBC.

In summation, the Agent reiterated the design concept proposed and emphasized that all of the measures being offered where the proposed construction deviated from the strict prescriptive requirements of the Code will achieve an appropriate level of sufficiency of compliance. In his opinion, an equivalent level of life safety was being afforded to the occupants of the buildings in this regard.

6. <u>Respondent's Position</u>

The Designate for the Respondent submitted that the Code requirements in respect to the items in dispute were clearly set out and that their interpretation was not at issue in this regard. He stated that the proposed natural gas fireplaces in the lounge areas of the building and the use of heavy timber and

plywood sheathing in the roof assembly were contrary to the specific provisions of the Ontario Building Code.

The Designate acknowledged the proposal put forth by the Applicant and the compensating construction being offered, however, in his opinion, these measures did not fall within the scope of Section 2.7 of the Code governing the acceptance of equivalents. He further noted that the past BCC rulings referred to by the Agent for the Applicant could not be applied to the subject proposals. As such, he stated that he did not have the authority to grant permit approval in this regard.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed natural gas fireplaces to be located in the fireplace lounges, which constitute extensions of public corridors leading to exits in sites 1 and 3 do not provide sufficiency of compliance with Sentence 3.3.1.2.(3) of the Ontario Building Code.

It is also the decision of the Building Code Commission that the use of glued-laminated heavy timber beams and purlins as well as plywood sheathing for attachment of copper roofing proposed for use in the roof assembly of the fireplace lounge pavilion of site 3 provides sufficiency of compliance with Sentences 3.2.2.43.(2), 3.2.2.13.(1) and 3.1.5.3.(2) of the Ontario Building Code at the Student Residence Buildings for Queen's University, 23 Albert Street (site 1) and 194 Stuart Street (site 3), Kingston, Ontario.

8. Reasons

i) The installation of a fuel fired appliance (gas fireplace) in a public corridor serving as an access to exit is not permitted by the Code. Furthermore, the compensating measures offered will not provide sufficiency of compliance to maintain the integrity of the access to exits.

ii) The Commission is satisfied with the proposed roof assembly at the site 3 building in as much as the fireplace lounge sprinkler system exceeds the NFPA13 requirements set out in the OBC.

iii) The sprinklers heads are to be equipped with deflectors within 150 mm of the underside of the ceiling.

iv) The proposed use of combustible thermal insulating material is permitted by the Code.

v) A 16 mm layer of water resistant gypsum board is being provided as a thermal barrier on top of the metal deck and below the rigid insulation and plywood sheathing.

vi) The size of the beams and purlins used in the roof assembly of the fireplace lounge exceed the minimum specifications for heavy timber set out in the Code and the heavy timber components provide an alternative to a 45 minute fire resistance rating in lieu of the nonrated, non combustible assembly.

vii) The proposed glu-lam beams and purlins offer better fire performance than elements of a decorative wood ceiling which would be permitted by the Code.

Dated at Toronto this **1st** day in the month of **August** in the year **2002** for application number **2002-19**.

Ruling No. 02-21-876
Application No. 2002-17

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Article 3.2.2.24. and Sentence 3.2.3.7.(1) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Michael Moldenhauer, Moldenhauer Developments, for the resolution of a dispute with Frank Asta, Chief Building Official, Town of Oakville, to determine whether the proposed compensating measures offered in a building containing A2 and D occupancies and having exposing building faces with unprotected openings less than 10% of the exposing building face and which includes elements of combustible construction, provides sufficiency of compliance with Article 3.2.2.24. and Sentence 3.2.3.7.(1) of the Ontario Building Code at 130 - 132 Thomas Street, Oakville, Ontario.

APPLICANT	Michael Moldenhauer Moldenhauer Developments Mississauga, Ontario
RESPONDENT	Frank Asta Chief Building Official Town of Oakville
PANEL	Len King, Vice-Chair John Guthrie Gary Burtch
PLACE	Toronto, Ontario
DATE OF HEARING	August 1, 2002
DATE OF RULING	August 1, 2002
APPEARANCES	Leszek Muniak Larden Muniak Consulting Inc. Toronto, Ontario **The Applicant** Frank Asta Chief Building Official Town of Oakville **The Respondent**

RULING

1. The Applicant

Michael Moldenhauer, Moldenhauer Developments, has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and has constructed a double occupancy building at 130 - 132 Thomas Street, Oakville, Ontario.

2. Description of Construction

The Applicant has undertaken construction of a building, originally intended to be used as two, three-storey semi-detached dwellings. It is now the Applicant's intent that the building will contain both Group A, Division 2 and Group D occupancies. The structure is comprised of combustible construction and will be equipped with fire alarm and sprinkler systems.

The construction in dispute involves the fact that combustible building materials have been used in the erection of this building, which will now be used for A2 and D occupancies. In particular, as a result of the original plan for the building as a Group C occupancy, the structure includes combustible wood framing and the application of stucco to the exterior walls. After the framing and enclosure of the building had been competed a new prospective purchaser advised that he was interested in obtaining the subject the building for assembly occupancy and office uses. Plans were subsequently revised to accommodate the new intended occupancies, however, the combustible framing and building cladding remains at issue.

To compensate for the use of combustible construction where noncombustible materials are required the Applicant is proposing complete sprinkler protection for the interior of the building with the use of fast response sprinklers. In addition, protection from exterior exposure will be addressed through the provision of a dry deluge water system for the exterior side walls of the building. This system will be activated by linear heat detectors situated at the floor assemblies above the first and second storeys. Further, as noted above, the building will also be equipped with a fire alarm system which would not be required by the Code.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed measures, offered to compensate for the use of combustible construction in a building containing Group A, Division 2 and Group D occupancies and having exposing building faces containing unprotected openings of less than 10% of the exposing building face, provide sufficiency of compliance with Article 3.2.2.24. and Sentence 3.2.2.7.(1) of the Ontario Building Code (OBC).

Article 3.2.2.24. provides that a building classified as having a Group A, Division 2 occupancy is permitted to conform to the provisions of Sentence (2) if the building is sprinklered and not more than six storeys in building height. Sentence (2) requires that the building be comprised of noncombustible construction and that floor assemblies be fire separations having a fire-resistance rating of at least one hour. Furthermore, mezzanines are also to be provided with a one hour fire-resistance rating and all loadbearing walls, columns and arches are to have a fire-resistance rating at least equal to the supported assembly.

In regard to the construction requirements of the exposing building face, Sentence 3.2.3.7(1) requires

that, with exceptions not applicable here, where the prescribed limiting distance for a Group A, B, C, D or F3 occupancy permits the building face to include unprotected openings of no more than 10%, the exposing building face is to be of noncombustible construction having a fire-resistance rating of not less than one hour. In addition, the building is to be clad with noncombustible construction.

With respect to the subject building where the most restrictive construction requirements are associated with the proposed Group A, Division 2 occupancy, the Code would require the building to be constructed of noncombustible construction. Further, as noted in the requirements of Sentence 3.2.3.7.(1), noncombustible construction and cladding would be required where the exposing building face contains unprotected openings of less than 10% of the exposing building face, as is the case in this building.

To compensate for the use of combustible construction framing materials and stucco in the subject building the Applicant is proposing certain compensating measures. These measures include sprinklering the entire building area, where only sprinklering of the A2 portions of the building would be required. Further, a dry deluge water system is proposed for protection of the building exterior walls in addition to the inclusion of a monitored fire alarm system which would not be required in this instance.

4. Provisions of the Ontario Building Code

3.2.2.24. Group A, Division 2, up to 6 Storeys, Any Area, Sprinklered

(1) A *building* classified as Group A, Division 2, that is not limited by *building area*, is permitted to conform to Sentence (2) provided

(a) except as permitted by Sentence 3.2.2.7.(1), *the building* is *sprinklered*, and
(b) it is not more than 6 *storeys* in *building height*.

(2) Except as permitted by Article 3.2.2.16., the *building* referred to in Sentence (1) shall be of *noncombustible construction*, and

(a) floor assemblies shall be *fire separations* with a *fire-resistance rating* not less than 1 h,
(b) *mezzanines* shall have a *fire-resistance rating* not less than 1 h, and
(c) all *loadbearing* walls, columns and arches shall have a *fire-resistance rating* not less than that required for the supported assembly.

3.2.3.7. Construction of Exposing Building Face

(1) Except as permitted by Articles 3.2.3.9. and 3.2.3.10., if a *limiting distance* shown in Table 3.2.3.1.A. or Table 3.2.3.1.C. for a Group A, B, C, D or Group F, Division 3 *occupancy* classification permits an *exposing building face* to have *unprotected openings* not more than 10% of the *exposing building face*, the *exposing building* face shall be

(a) of *noncombustible construction* having a *fire-resistance rating* not less than 1 h, and
(b) clad with *noncombustible* cladding.

5. Applicant's Position

The Agent for the Applicant outlined the history of the construction of the subject building advising that it was originally designed as a Part 9 structure for use as two, three storey semi-detached dwellings.

During the time the building was being constructed and after the wood framing had been completed and stucco had been applied to the exterior, a prospective purchaser advised that they wished to use the building to accommodate a restaurant on the ground floor and offices and meeting rooms on the upper levels. In this regard, a change of use was applied for which brought the construction under Part 3 of the Code which includes more restrictive requirements for wall and floor assemblies.

The Agent advised that the situation was now such that, given the intended use, the structure would no longer comply with the Building Code requirements. The wall assembly would be required to provide a one hour fire-resistance rating and be clad in noncombustible construction. Unfortunately, as a result of the advanced stage of construction, these requirements could not be easily accommodated. To compensate for the use of combustible construction elements, the Agent advised that quick response sprinkler heads were to be installed throughout the building. He also stated that a fire alarm system, which would not be required by the Code was also offered. In respect to protection of the exterior of the structure, the Agent advised that a deluge water system would be installed at the eaves of the building and a one hour fire rating would be provided on the interior of the structure by the use of drywall. Linear heat detectors situated at the floor assemblies above the first and second floors would activate the deluge system and, he submitted, would provide an equivalent level of protection as a one hour fire-resistance rating on the exterior.

In summation, the Agent advised that the compensating measures being proposed to address the use of combustible building materials will, in his opinion, achieve sufficiency of compliance with the requirements of the Building Code.

6. Respondent's Position

The Respondent submitted that a permit for the construction of two residential units had been issued by the building department. This permit included the used of fully combustible construction as would be permitted in a Part 9 application. When approached about the change of use to accommodate A2 and D occupancies within the subject building, the issue of conformance with the Part 3 requirements for use of noncombustible construction became apparent.

The Respondent acknowledged the measures proposed by the Applicant to compensate for the use of combustible material but stated that he continued to have a concern. He did not feel comfortable accepting an equivalency of the magnitude as was being proposed.

In summation, the Respondent maintained that he was unable to accept the proposed compensation and was concerned with what would be a Part 3 use in a Part 9 building in the centre of the downtown area. A significant amount of wood was involved in the framing and enclosure of the structure and, as a result, he could not view the building as being Code compliant.

7. Commission Ruling

It is the decision of the Building Code Commission that the compensating measures to be provided in the multiple occupancy building (A2 and D) having exposing building faces with unprotected openings less than 10% of the exposing building face and includes elements of combustible construction will provide sufficiency of compliance with Article 3.2.2.24. and Sentence 3.2.3.7.(1) of the Ontario Building Code at 130-132 Thomas Street, Oakville, Ontario.

8. Reasons

i) Sprinklering of the entire building will exceed OBC requirements which would only mandate sprinklering of the first and second floors. In addition, quick response sprinkler heads are to be used which will further contribute to the effectiveness of the suppression system as a compensating measure.

ii) A fire alarm system, which is not required by the Code, will be provided.

iii) A dry deluge water system is to be installed at the eaves of the building on both sides of the structure . This deluge system will be activated by linear heat detectors.

iv) The building contains no residential occupancy.

Application No. 2002-14

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 9.5.2.1.(1), Section 3.8. , Part 11 and Sentences 11.4.2.3.(1) and 11.4.3.4.(2) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Troy Loop, owner, The Vintage Goose Inn, for the resolution of a dispute with Dave Gibson, Chief Building Official, Town of Kingsville, to determine whether the conversion of a century home into a six room inn, where no renovation to the existing entranceways is contemplated, is required to provide barrier-free access in accordance with Sentence 9.5.2.1.(1) and Section 3.8. when considering Part 11 and Sentences 11.4.2.3.(1) and 11.4.3.4.(2) of the Ontario Building Code at The Vintage Goose Inn, 31 Division Street South, Kingsville, Ontario.

APPLICANT	Troy Loop, owner The Vintage Goose Inn Kingsville, Ontario
RESPONDENT	Dave Gibson Chief Building Official Town of Kingsville
PANEL	Len King, Vice-Chair John Guthrie Gary Burtch
PLACE	Toronto, Ontario
DATE OF HEARING	August 1, 2002
DATE OF RULING	August 1, 2002
APPEARANCES	Troy Loop, owner - via telephone conference The Vintage Goose Inn Kingsville, Ontario **The Applicant** Dave Gibson Chief Building Official Town of Kingsville **Designate for the Respondent**

RULING

1. The Applicant

Troy Loop, owner, The Vintage Goose Inn, has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is undertaking renovations to an existing residential dwelling which will result in its conversion into a multi-suite inn known as The Vintage Goose Inn at 31 Division Street South, Kingsville, Ontario.

2. Description of Construction

The Applicant is undertaking renovations to an existing building, originally constructed in 1887. The structure has a building area of 237.8 m^2(2,560 ft^2) and is three storeys in building height. Ongoing renovations will serve to convert the single detached dwelling into an inn, having a Group C occupancy classification and containing six guest suites. The building is comprised of combustible construction and is equipped with a fire alarm system.

The construction in dispute involves the nature of the renovations proposed and whether barrier-free access into the building is required as a result of the conversion. In this respect, the Applicant has not proposed any alteration to the entranceways or paths of travel into the building. The main front entrance is situated approximately six or seven feet above grade and is accessed by way of an existing stair which leads to the front porch of the building. The rear entrance is situated on the ground level with an interior stair leading to the first floor of the structure. Original drawings have been revised to show one barrier-free accessible guest suite situated on the ground floor of the building. Originally, however, no such proposal was made.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the conversion of a single detached dwelling into a Group C occupancy of more than one suite, where no alterations are proposed for the building's entrances, is required to comply with the barrier-free access provisions of Sentence 9.5.2.1.(1) and Section 3.8. when considering Part 11 and Sentences 11.4.2.3.(1) and 11.4.3.4.(2) of the Ontario Building Code (OBC).

Sentence 9.5.2.1.(1) provides that, with exceptions not applicable here, every building shall be designed in conformance with the barrier-free accessibility provisions outlined in Section 3.8. As an inn, operating to serve more than eight persons, the barrier-free design provisions outlined in Section 3.8. would be applicable. However, given that this is an existing building and renovations are being conducted in accordance with Part 11, the dispute involves whether barrier-free access into the structure is required in light of the fact that no alterations to the exterior entranceways or paths of travel leading into the building are being proposed.

In this respect, when considering Part 11, Clause 11.4.2.3.(1)(b) stipulates that the performance level of an existing building is reduced when it is converted from a single suite Group C major occupancy to a Group C major occupancy containing more than one suite, which is the case in this instance. Further, Sentence 11.4.3.4.(2) requires that, where the performance level is reduced as a result of a change in major occupancy, additional construction is required in conformance with other parts of the Code, including Sections 9.5., as it applies to the new major occupancy.

As noted above, no alterations are being proposed for the existing entranceways into the building. It is the Applicant's position that, because the structure is an existing building, barrier-free access is not required to be provided into the interior since there is no proposal to change the exterior access. The Respondent, however, takes the position that the conversion from a single suite Group C major occupancy to a multi-suite Group C classification, reduces the performance level and/or increases the hazard index of the structure and, therefore, additional construction is required, including the provision of barrier-free design, both into and throughout the first level of the building.

4. Provisions of the Ontario Building Code

Sentence 9.5.2.1. Barrier-Free Design - General

(1) Except as provided in Sentence (2) and Article 3.8.1.1., every *building* shall be designed in conformance with Section 3.8.

(2) The requirements of Section 3.8. need not be provided for houses including semi-detached houses, duplexes, triplexes, town houses, row houses and *boarding, or rooming houses* with fewer than 8 boarders or roomers.

Section 3.8. Barrier-Free Design

See the Ontario Building Code

Part 11 Renovation

See the Ontario Building Code

11.4.2.3. Reduction in Performance Level - Change of Major Occupancy

(1) Except as required in Sentence 11.4.2.5.(4), the *performance level* of an existing *building* is reduced where proposed *construction* will result in

(b) the conversion of a *suite* of a Group C *major occupancy* into more than one *suite* of Group C *major occupancy*,

11.4.3.4. Compensating Construction - Change in Major Occupancy

(2) Where the *performance level* of an existing *building* is reduced under Sentence 11.4.2.3.(1), additional *construction* shall be required in order that the *building* or part of the *building* subject to change of *major occupancy* conforms to the requirements of Subsection 3.2.6., Sections 3.7., 3.11., 9.5., and 9.7., Subsections 9.10.16., Sections 9.31. and 9.32., and Subsections 9.34.1., 9.34.2., and 9.34.3. as they apply to the new *major occupancy* that the *building* or part of the *building* is to support.

5. Applicant's Position

The Applicant advised the Commission that he is one of the owners of the Vintage Goose Inn and Spa. He, acknowledged at the outset that he does not know much about the Ontario Building Code but, in undertaking this conversion he sought advice from others in the business about, among other things, the barrier-free access requirements. In this regard he reviewed other similar building conversions, in and around this area of the province. As a result he discovered that none had been required to provide

for barrier-free accessibility when there were no alterations to the building's entranceways or exterior access routes.

In respect to the subject building, which was constructed in 1887, the Applicant submitted that they have undertaken renovations to the plumbing, mechanical and electrical systems to accommodate the proposed use. Other than those alterations, very little else has been done to change the character of the structure as they are intending to maintain the historic appearance of the building. No renovations were undertaken to either the outside of the building nor to the entrances. Presently, partons are required to climb the existing stair leading to the grand front porch of the building. This porch, he submitted, is six to seven feet above ground and dominates the front of the structure. A ramp to access this level would have to be approximately 60 to 70 feet long and would vastly alter the historic appearance of this old home. He argued, it was his understanding that, if the existing entrances weren't modified to permit barrier-free accessibility, then no alterations would be required as this was an existing situation.

The Applicant noted that, if the building were larger, and did not fall under Part 9 of the Code, they would not be led to the barrier-free design requirements outlined in 3.8. and would, therefore, not be required to alter the entrances. The Applicant submitted that it was simply illogical to require barrier-free access into the old building. Patrons requiring such access would be unable to travel to the upper floors of the structure and, before his original plans were altered to satisfy the building official, there would not have been barrier-free accommodations on the first floor either. In fact, plans were only altered to obtain the permit required to start work on the structure. The Applicant argued that, although plans were drawn up to provide for a barrier-free accessible suite, it remained his position that, since the entrances were not being renovated, barrier-free access into the structure should not be required.

6. Respondent's Position

The Respondent submitted that he had advised the Applicant at the start of the process that the municipality required barrier-free access into and throughout the first floor of the building. Several issues were discussed as a result of the original plans submitted with the permit application, with barrier-free accessibility being one of them. In this regard, most other items had already been addressed and only this dispute remained.

The Respondent advised that, although the building is an older home, it has not been designated as a heritage building. In his review of the application for conversion and renovation, he examined the Code requirements of Clause 2.4.1.2.(1)(b) and Table 2.4.1.2., which led him to conclude that the change in occupancy from a single unit Group C building to a multi-suite Group C occupancy would increase the hazard index, requiring conformance with Article 9.41.1.1.(1)(b) and Section 9.5. In addition, a review under Parts 10 and 11 of the Code lead to the conclusion that compensating construction would be required under 11.4.3.4. which, in turn, mandates compliance with Section 9.5. This section further leads to the requirement for conformance to Section 3.8. which mandates, among other thing, that barrier-free access into the structure be provided.

In addition, the Respondent submitted that his reading of the Code was confirmed by the Building and Development Branch (BDB) of the Ministry of Municipal Affairs and Housing, who were consulted for an opinion in this regard. He also noted that the Technical Background Information Report prepared by the BDB for the Commission hearing approached the issue as one where the performance level would be decreased as a result of the conversion, however, the result was the same. Barrier-free access is required in this circumstance.

The Respondent continued by submitting that there were a number of ways in which the required access could be provided. He submitted that it was his understanding that the widths of the existing doorways were sufficient to meet the Code requirements. The only issue was overcoming the obstacle presented by the stairs. He argued that access could be provided by either a ramp or an hydraulic lift, or a combination of both, as pictured in the revised drawings submitted by the Applicant which allowed them to proceed with renovations. He didn't believe that it would be especially problematic to provide the required means to access the building.

In summation, while he recognized the Applicant's desire to maintain the historic character and appearance of the structure, his reading of the Code requirements led him to conclude that disabled persons must be provided with the means to access the main floor of the structure. He noted that on this level they would have access to the living room, dining room, and a bed and bath suite, designed to provide barrier-free accessibility.

7. Commission Ruling

It is the decision of the Building Code Commission that the conversion of a century home into a six room inn, where no renovation to the existing entranceways is contemplated, is required to provide barrier-free access in accordance with Sentence 9.5.2.1.(1) and Section 3.8. when considering Part 11 and Sentences 11.4.2.3.(1) and 11.4.3.4.(2) of the Ontario Building Code at The Vintage Goose Inn, 31 Division Street South, Kingsville, Ontario.

8. Reasons

i) As a result of the conversion of the building from a single detached dwelling into an inn, there is a reduction in the performance level of the structure under Sentence 11.4.2.3.(1).

ii) Sentence 11.4.3.4.(2) requires that, where the performance level is reduced, additional construction is required in conformance with Section 9.5.

iii) Further, Sentence 9.5.2.1., requires conformance with Section 3.8. in respect to barrier-free design, which includes barrier-free accessibility into the building.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Article 11.3.1.1. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by A.C. Houle, Principal, Morey Houle Chevrier Engineering Ltd., for the resolution of a dispute with Terry Davidson, Sewage System Inspector, Ottawa Septic System Office, to determine whether the repair of an existing Class 4 septic system, specifically with respect to the grain size of the imported sand filter material being used, provides sufficiency of compliance with the provisions of Article 11.3.1.1. of the Ontario Building Code at 1376 River Road, Manotic, Ontario.

APPLICANT	A.C. Houle Morey Houle Chevrier Engineering Ltd. Manotick, Ontario
RESPONDENT	Terry Davidson Manager Ottawa Septic System Office
PANEL	Bryan Whitehead, Vice-Chair
PLACE	Toronto, Ontario
DATE OF HEARING	July 4th, 2002 and August 8th, 2002
DATE OF RULING	September 4th, 2002
APPEARANCES	A. C. Houle, Principal Morey Houle Chevrier Engineering Ltd. **The Applicant - via telephone conference**
	Terry Davidson, Manager Ottawa Septic System Office **The Respondent - via telephone conference**

RULING

1. The Applicant

A.C. Houle, Principal, Morey Houle Chevrier Engineering Ltd., has applied for a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and has undertaken a repair to the existing Class 4 septic system at 1376 River Road, Manotic, Ontario.

2. Description of Construction

The Applicant is under contract to institute repairs to the septic system serving an existing Class C, residential building having a total finished area of 260 m^2. The dwelling contains a total of 22.5 fixture units and is serviced by the existing class 4 septic system having a total daily design flow rate of 2200 litres/day. The site is grass covered and has a northerly slope of approximately 13%. There is a drilled well on site to supply water to the residential dwelling.

The subject septic system is identified as a Class IV F.M. (filter media) type leaching bed, 28 m^2 in contact area. It was approved by the Ministry of Environment and Energy (MOEE) and constructed in 1988. The original system was failing and a permit for the repair of the system was sought to rectify the situation. Upon investigation of the malfunctioning system by the Applicant it was discovered that the leaching bed did not have a sand mantle which was to have been provided under MOEE guidelines at the time of initial construction. In addition, it was apparent that filter media sand had not been used in the construction of the leaching bed. Further, the bed had been backfilled and covered with low permeability silty clay material. The pipe between the septic tank and leaching bed was cracked and sloping in the wrong direction and the upper 0.3 m of the sand filter material below the distribution pipes was plugged with organic material (biomat) which was preventing the dispersion of effluent.

As part of the repair of the malfunctioning system the biomat impacted sand filter material beneath the leaching bed was removed and replaced with crushed stone. The distribution pipes were also replaced and an additional two runs of pipe to the leaching bed were added, increasing the loading area from 28 m^2 to 42 m^2. Further, the silty clay material was removed from the sides and top of the leaching bed and the 15 metre long, 0.5 m thick sand mantle extending the full width of the bed, which should have been provided with the initial construction, was added.

The specific element of the repair in dispute involves the sand filter material used in the repair of the leaching bed. An initial grain size evaluation of the sand filter material, informed that the gradation of the subject material was slightly outside the OBC envelope for filter media sand. The permit which as issued in connection with the repair specified that Filter Media sand was required if the bed was to be rebuilt, as such, the Respondent is of the opinion that the material used in the leaching bed repair does not comply with Code requirements. The Applicant's position in this regard is that the permeability of the subject sand material is at least equal to or exceeds that of the sand filter material used in the original construction. In this regard, as determined by additional testing of the material at the request of the Commission, it was found that the coefficient of uniformity of the original sand filter material was 10.7, while the sample taken from the new material in dispute had a uniformity coefficient of 12. Further, it was determined that the grain size curve for the new material more closely reflected the gradation envelope depicted in the Code.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the grain-size of the sand filter material used in the repair of the existing septic system provides sufficiency of compliance with Sentence 11.3.1.1.(1) of the Ontario Building Code (OBC).

This sentence of the Code provides that, when an existing building system is materially altered or repaired, the performance level of the building shall be at least equal to the performance level prior to the alteration or repair. In this regard, the grain-size analysis performed on samples of both the original and newly added material would appear to illustrate a slight improvement in quality. In other words, while not meeting the requirement for filter media material as outlined in the permit approval in relation to the repair work being undertaken, the grain size curve of the new material more closely conforms to the OBC gradation envelope than does the original sand.

4. Provisions of the Ontario Building Code

11.3.1.1. Material Alteration or Repair of a Building System

(1) Where an existing *building system* is materially altered or repaired, the *performance level* of the *building* after the material alteration or repair shall be at least equal to the *performance level* of the *building* prior to the material alteration or repair.

5. Applicant's Position

The Agent for the Applicant outlined the condition of the existing failed system upon initial inspection. He advised that the leaching bed was surrounded by clay on all four sides and effluent was being discharged to the surface. In an effort to improve the situation, the clay material was removed from three sides of the bed and new sand filter material was laid. Furthermore, although the Ministry of the Environment issued a Use Permit in August 1988, the required mantle for the system was not provided. They have now constructed this mantle in accordance with the original permit. The Agent argued that all of the repair work undertaken constitutes an improvement to the existing situation and, therefore, complies with the Part 11 requirements of the Code.

The Agent acknowledged that the permit issued by the Ottawa Septic System Office in connection with the subject repair specified that filter media sand was to be used if the bed needed to be rebuilt. He also acknowledged that there are exacting specifications for filter media sand, in light of the potential for substandard material to contribute to the clogging of the bed. Despite this, the Agent advised that the contractor had obtained sand filter material that did not meet the standards for new construction set out in the Code. He admitted that the subject material was preferred by the installer because it was less expensive than filter media sand. Despite this however, the Agent emphasized that the material which has been used is equal or superior to the original sand filter material employed in the subject system.

At the request for testing by the Commission, the Agent submitted results which indicated that the coefficient of uniformity of the original sand filter material was found to be 10.7 while the sample taken from the new material in dispute had a uniformity coefficient of 12. The results further illustrated that the grain size curve for the new material more closely conformed to the OBC gradation envelope than the curve depicted for the original sand. This, the Agent argued, represents an improvement in the quality of material used in the filter bed and therefore provides sufficiency of compliance with the Part 11 requirements of the Code.

In summation, the Agent stated that, when considering Article 11.3.1.1., the repair which was undertaken does not reduce the performance level of the system. The tests conducted prove that the filter sand used to replace the existing material is better than what had been approved for use by MOEE at the time of original construction. He emphasized that this is a repair situation and should not be held to the same standards as new construction.

6. Respondent's Position

As background to the subject dispute the Respondent advised that the sewage system was approved by the Ministry of Environment as a filter bed in May 1988. The sand supplier, Greely Sand and Gravel Inc., for the 1988 bed provided weigh bills for filter media for the sand fill for the bed. The contractor Eric Draper certified that sand filter material was used. The Ministry of the Environment issued a Use Permit (August 8, 1988) for the system, despite the absence of a mantle, backfilling and grading. No mantle was installed.

The Respondent submitted that, in response to the Applicant's request, a sewage permit was issued by the Septic System Office for the repair of the tile bed on the subject property. Further, it was specified on the permit that if the bed was to be replaced, filter media sand was to be used. In this regard, by way of a letter from the Agent for the Applicant dated May 2, 2002 it was acknowledged that "(t)he grain size distribution of the filter sand is also known to be a factor contributing to the clogging of the filter sand. For this reason, there are strict specifications for filter madia sand material." Agreeing with this analysis the Respondent advised that receipts/waybills are required to be provided by permit applicants to prove that the grain size of the filter media sand would meet Code requirements. No such receipts were supplied in connection with this case, however it appeared evident upon inspection that the grain size of the new material used would not meet Code specified standards.

Furthermore, the Respondent stated that the work that has been undertaken on the subject site constitutes more of a replacement than a repair. He was uncertain exactly how much sand had been used and believed that the entire bed had been replaced and expanded. In any event, he was not satisfied that the material that had been used was at all satisfactory. He also argued that the Agent's claim that the system had been improved was not entirely valid. He stated that any repair made to a failed system will result in some improvement in performance but this does not mean that all changes will result in a viable sewage system. The standard which must be met is whether it constitutes an improvement to what the system was originally designed and constructed to achieve. The benchmark of Part 11 is not the failed system but the old, original, system. The Respondent submitted that, in his opinion, filter media sand was required in the construction of the original system and, therefore, filter media sand must be used in the repair.

In respect to the results of the testing done at the Commission's request, the Respondent admitted that the new material tested marginally better than the original sand but stated that neither is acceptable, and both have coefficient uniformities greatly beyond OBC requirements. The Respondent also provided the Commission with a report of what has occurred on the property between the initial hearing of this matter and the reconvened session. He submitted that, in contravention of acceptable standards of practice, the installer had proceeded to backfill the site without inspection and has sodded the area. Moreover, the Respondent argued that, because of the new runs of distribution pipe added, this "repair" also contained an element of new construction that is required to comply with the minimum standards of the Code.

In summation, the Respondent reiterated that the permit which had been issued specified the use of filter media sand. Cost, he argued, should not be an acceptable reason for not complying with the Code. He is concerned that the system, as now constructed without the benefit of inspection, will fail again.

He submitted that as little as three inches of biomat material would cause a system to fail and with the use of this substandard material in the bed, he felt that failure would likely occur.

7. Commission Ruling

It is the decision of the Building Code Commission that, in the matter of the grain-size quality of the imported sand fill used to repair the existing leaching bed, the sand fill provides sufficiency of compliance with Sentence 11.3.1.1.(1) of the Ontario Building Code at 1376 River Road, Manotic, Ontario.

8. Reasons

i) Based on the construction details provided by Morey Houle Chevrier Engineering Ltd. and the single grain-size analysis for the existing sand fill, the existing bed, although approved in 1988 as a filter bed (now defined in Section 8.7.5.), and provided with a Use Permit on August 8, 1988, was not constructed to the prevailing standards.

ii) The sand fill used in the repair, based on the two grain-size analyses provided is, on average, superior in quality to the existing sand fill.

iii) Although the Building Permit and the Engineer's specifications both required filter sand (as defined by Sentence 8.7.5.3.(3)), no Order was issued relative to the system and, therefore, Part 11 of the Code applies to the repair that has been undertaken through a permit.

iv) In viewing the repair, it is considered that the quality of the new sand fill provided will not result in a loss of performance when compared to the existing sand fill, prior to the plugging of the sand by biomat.

9. Comments/Recommendation

Although not considered in this Decision, it is recognized that the provision of the mantle (not considered a compensating measure because it was required in the original approval) and the extra runs of pipe and accompanying stone should improve the performance of the system. However, it should be noted that the substandard filter sand material may result in a future failure because of plugging and biomat formation. In addition, the system expansion by the provision of extra runs of distribution pipe supplied does not meet the requirements of Sentence 11.3.1.2.(1), in that the sand fill used in this new construction does not meet the requirements of Sentence 8.7.5.3.(3) of the Ontario Building Code.

In view of the discrepancy between Part 11 and the requirement of the Septic System Permit (and design specifications) outlined in Part 8 and issued for this repair, it is recommended that the Building and Development Branch of the Ministry of Municipal Affairs and Housing consider an amendment to the Ontario Building Code which would require that any construction undertaken under Part 11 must, at a minimum, conform to the requirements outlined in the Building Permit which was issued for the original construction.

AND IN THE MATTER OF an application by Hank Allen, Raha Ranch & Equipment, for the resolution of a dispute with Ron Liinamaa, Chief Building Official, Municipality of St. Charles, to determine whether the proposed fabric material roof which is not considered as a Class A, B or C roof covering, provides sufficiency of compliance with Section 3.1.15. of the Ontario Building Code at Granifab Corp., Casimir Road, Part 5, Lot 10, Concession 6, (Casimir), St. Charles, Ontario

APPLICANT	Hank Allen Raha Ranch & Equipment St. Charles, Ontario
RESPONDENT	Ron Liinamaa Chief Building Official Municipality of St. Charles
PANEL	Len King, Chair-Designate Fred Barkhouse Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	June 20, 2002
DATE OF RULING	June 20, 2002
APPEARANCES	Hank Allen Raha Ranch & Equipment St. Charles, Ontario **The Applicant**

RULING

1. The Applicant

Hank Allen, Raha Ranch & Equipment, has applied for a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is proposing to construct a building for use as a granite cutting and polishing facility by Granifab Corp., Casimir Road, Part 5, Lot 10, Concession 6, (Casimir), St. Charles, Ontario

2. Description of Construction

The Applicant is proposing to construct a new industrial facility for the processing of granite. The structure will be one storey in building height and have a Group F, Division 3 occupancy classification. The total building area of the facility would be 557.42 m^2 (6000 ft^2). No sprinkler system, fire alarm system nor standpipe and hose system are proposed for the building.

The construction in dispute involves the nature of the roof covering for the proposed structure. The Applicant is proposing to erect the structure using pre-engineered arched steel frames to support the combustible fabric material covering.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed fabric material roof covering, which is not considered as a Class A, B or C roof covering, provides sufficiency of compliance with Section 3.1.15. of the Ontario Building Code (OBC).

Article 3.1.15.1. stipulates that any roof covering classification shall be determined in conformance with CAN/ULC-S107-M, "Standard Methods of Fire Tests of Roof Coverings". Furthermore, Sentence 3.1.15.2.(1) mandates that, except under certain circumstances, every roof covering shall have a Class A, B or C classification. Sentence (2) outlines the exceptions to this requirement which would include a tent, an air supported structure or a building of A2 occupancy which is not more than 2 storeys in height and 1,000 m^2 in area, on the condition that the roof covering is underlaid with noncombustible material.

The subject roof, as proposed by the Applicant, consists of a combustible fabric material which does not have an A, B or C classification in accordance with the CAN/ULC-S107-M standard. In addition, the proposed structure would not meet any of the provisions for exemption outlined in Sentence 3.1.15.1.(2).

4. Provisions of the Ontario Building Code

3.1.15.1. Roof Covering Classification

(1) A roof covering classification shall be determined in conformance with CAN/ULC-S107-M, "Standard Methods of Fire Tests of Roof Coverings".

3.1.15.2. Roof Coverings

(1) Except as permitted by Sentence (2), every roof covering shall have a Class A, B or C classification as determined in accordance with Article 3.1.15.1.

(2) A roof covering is not required to have a Class A, B or C classification for
(a) a tent,
(b) an *air-supported structure*, or
(c) a *building* of Group A, Division 2 *occupancy* not more than 2 *storeys* in *building height* and not more than 1 000 m^2 (10,800 ft^2) in *building area* provided the roof covering is underlaid with *noncombustible* material.

5. Applicant's Position

The Applicant submitted that the fabric roof proposed for this structure represents the most economical means to cover the building. He submitted that, because this is a small municipality, hydro service is difficult and costly to obtain. The translucence of the proposed fabric cover would permit sunlight to filter through to assist in lighting the facility. He stated that, in his opinion, the roof material would not pose a hazard in respect to the anticipated industrial operation. He submitted that the contents of the building would consist of rock and heavy cast iron processing equipment. There would be no combustible contents inside the building.

The Applicant argued that, in the past, he had been granted a permit for similar structures from this municipality. He also pointed out that this material is commonly used to cover agricultural buildings. In this respect the Applicant provided photos for the Commission's consideration, of a similar structure that had been destroyed by fire. He pointed out that only the tarp covering the support structure burned. Nothing inside the building was destroyed including the exposed hay and other combustible materials. In addition, he emphasized that the fire did not spread to an adjacent silo. His argument was that the fabric would burn itself out so quickly that there was no risk to person or property. As a result, he argued, sprinklering would be of no assistance.

6. Respondent's Position

The Respondent did not attend the hearing and, instead, relied on his written submission. In this respect his position was that the proposed roof covering did not comply with Articles 3.1.15.1. and 3.1.15.2. in that the material did not have an A, B or C classification.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed fabric material roof which is not considered as a Class A, B or C roof covering, does not provide sufficiency of compliance with Section 3.1.15. of the Ontario Building Code at Granifab Corp., Casimir Road, Part 5, Lot 10, Concession 6, (Casimir), St. Charles, Ontario.

8. Reasons

i) The proposed roof covering does not conform with the CAN / ULC-S107-M standard. It is not considered a Class A, B or C covering.

ii) No adequate compensating measures were offered to achieve sufficiency of compliance with the provisions established by the Ontario Building. Code.

Dated at Toronto this **20th** day in the month of **June** in the year **2002** for application number **2002-13**.

PLACE	Toronto, Ontario
DATE OF HEARING	June 20, 2002
DATE OF RULING	June 20, 2002
APPEARANCES	Robert Dyck, President Robert J. Dyck Architect and Engineer Inc. **Agent for the Applicant**
	Roy C. Reiche Barrister & Solicitor **Legal Counsel for the Respondent**

RULING

1. The Applicant

Tammy Yantha, Dunn and Bay Holdings Ltd., has applied for a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is proposing to construct a senior's residence known as the Water Tower Lodge Retirement Home, Stafford Street, Barry's Bay, Ontario.

2. Description of Construction

The Applicant is proposing to construct a Group C senior's residence having a building area of 888 m^2. The structure is proposed to be 3 storeys in building height and comprised of combustible construction. The building is to be equipped with both a sprinkler system and a fire alarm system.

The construction in dispute involves the entire structure and, specifically, which version of the Ontario Building Code should be applied in determining the construction requirements for the building. According to the information supplied, an initial application for a building permit was submitted to the Township on June 29, 1998. However, a subsequent application, for which a permit was issued, was submitted to the Township on September 12, 2001. A ruling on which of these applications is valid will determine which version of the Ontario Building Code applies to the proposed construction.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the Transition Rule outlined in Clause 12.1.1.1.(1)(b) of the 1997 Ontario Building Code can be invoked to determine that the 1990 OBC construction requirements apply to the proposed building.

Clause 12.1.1.1.(1)(b) of the Code stipulates that, notwithstanding its revocation, Regulation 61 of the Revised Regulations of Ontario will continue to be in force for construction where working drawings, plans, etc. were substantially completed before April 6, 1998 and for which an application for a building permit under the 1990 Regulation was made before July 6, 1998. In addition, construction is to be commenced within six months after the issuance of the permit.

In this instance, an application for a building permit was submitted to the municipality on June 29, 1998. The applicants contend that, based on the date of this initial application, and the fact that drawings and specifications were submitted to the municipality prior to April 6, 1998, the provisions of the 1990 Building Code should apply to the proposed construction. The Respondent disputes this claim and takes the position that the earlier application was premature and incomplete. In addition, the municipality also contends that the 1998 application was abandoned in light of the new application submitted in 2001 for which a permit was issued. If this position is accepted, the 1997 Building Code would apply to this development.

4. Provisions of the Ontario Building Code

12.1.1.1. Continuation of Regulation 61 of R.R.O. 1990

(1) Notwithstanding the revocation of Regulation 61 of the Revised Regulations of Ontario, 1990, that Regulation continues in force in respect of *construction*

(a) for which a permit has been issued before the 6th day of April, 1998, or

(b) for which the working drawings, plans and specifications are substantially completed before the 6th day of April, 1998, and for which an application for a permit under Regulation 61 of the Revised Regulations of Ontario, 1990 is made before the 6th day of July, 1998

on condition that the *construction* is commenced within six months after the permit is issued.

5. Respondent's Position

Prior to the commencement of the hearing, the Solicitor for the Respondent raised the issue of jurisdiction, suggesting that this was not a matter to be decided upon by the Building Code Commission (BCC) but rather a legal dispute between the parties. In support of his position that the hearing should not proceed he outlined the dispute and addressed the jurisdictional issues in this regard.

The Solicitor stated that s.24 of the *Building Code Act* provides the BCC with the authority to make a determination on disputes where interpretation or sufficiency of compliance with the technical provisions of the Ontario Building Code are at issue. He argued that that is not the case in this instance. Furthermore, he advised that there are other legal encumbrances on proceeding at this time.

He continued by outlining the development history of the subject property stating that, despite the date of the June 29, 1998 application, it was never processed because it was not considered to be substantially complete. In addition, there were a number of other issues that had to be addressed including planning approvals that needed to be obtained. The Zoning and Official Plan Amendments were passed by council on January 17, 2000 and no appeals were filed, however, a conditional holding provision was attached to those approvals. The holding designation had to be lifted prior to the issuance of a building permit and this did not occur until January 14, 2002. The Solicitor further explained that a second building permit application was filed by the Applicant in September 2001. The initial application was, therefore, considered to have been abandoned and a permit was issued in response to the new application.

The Solicitor emphasized that, in his opinion, the Applicant was made aware from the beginning regarding the difficulties associated with this proposal. He brought to the Commission's attention a series of correspondence whereby the Applicant had been notified of the municipality's position and steps to be taken in obtaining a building permit were outlined. In addition, the Solicitor maintained that the historical facts of this case are also in dispute. The Applicant's claim that the 1998 application was substantially complete and that drawings, plans and specifications were submitted prior to April 1998 is being challenged by the municipality.

In summation, the Solicitor for the Respondent maintained that the dispute between the parties is only one of many legal issues to be resolved. The nature of the dispute is, therefore, not an interpretation of the technical provisions of the Code nor is it one where sufficiency of compliance with the technical provisions can be determined by the BCC. Section 24(1), he argued, provides the

Commission the authority to make a ruling only in one of those two areas.

6. Applicant's Position

In response to the assertion by Counsel for the Respondent that the Commission had no jurisdiction to consider the subject application, the Agent for the Applicant submitted that the provision in dispute is contained in the Ontario Building Code. He argued that the parameters outlined in Clause 12.1.1.1.(1)(b) have been met by the filing of an application in June 1998 and therefore the provisions of the 1990 Building Code should apply to the proposed construction.

In support of his claim that the 1990 Code should apply, the Agent pointed out that plans, drawings and specifications were submitted to the municipality prior to April 1998 and an application for a building permit was submitted prior to the July 6, 1998 deadline established in the Transition Rule set out in the Code. He further suggested that the long history of this matter is not a relevant factor in the determination of this dispute. What should be regarded, he stated, is the time frames set out in the Code and whether they have been met in this instance.

The Agent stated that, if the time frames are met then the 1990 Code applies. In addition, s. 8(2) of the *Building Code Act* stipulates that the Chief Building Official shall issue a permit unless the proposal is in contravention of another act or other applicable law. In response to the claim by Counsel for the Township that the first application was never processed, he argued that processing is not a requirement outlined in the Transition Rule. Only the requirement to submit and apply are specified.

When questioned by the Commission in respect to what technical issues, rather than legal ones, were to be decided, the Applicant submitted that the implementation of the Transition Rule in Part 12 requires a simple test as to which dates apply. If the Commission rules that the Applicant met the test then the OBC 1990 should apply to the construction. In this regard he argued that this client has met the parameters prescribed in the Code for the continuation of Regulation 61.

7. Commission Ruling

It is the decision of the Building Code Commission that, under section 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended, the Building Code Commission does not have the jurisdiction to determine the applicability of Clause 12.1.1.1.(1)(b) of the Ontario Building Code.

8. Reasons

i) Under s. 24(1) of the *Building Code Act*, the Building Code Commission has jurisdiction to resolve disputes:

- that are between a chief building official or building inspector and an applicant for, or holder of, a permit or a person to whom an order is given; and

- that concern the interpretation of, or the sufficiency of compliance with, the technical requirements of the Ontario Building Code.

In this case, while the Commission acknowledges that there is a dispute between the Chief Official and the Applicant, the parameters of that dispute involve legal issues arising from an administrative provision in the Ontario Building Code.

ii) Clause 12.1.1.1.(1)(b) is an administrative section of the Ontario Building Code and does not involve any technical requirement for construction that could be determined by this Commission.

iii) The courts are better equipped to make a determination on matters such as this, where facts are in dispute and issues of law are raised.

Dated at Toronto this **20th** day in the month of **June** in the year **2002** for application number **2002-09**.

Application No. 2002-07

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 3.2.4.20.(2) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Michael Bonnah, G.M. of Operations & Logistics, West Park Hospital, for the resolution of a dispute with Bruce Ashton, Deputy Chief Building Official, City of Toronto, to determine whether the use of unlisted, alpha-numeric display devices forming part of the call station located in the nursing stations provides sufficiency of compliance with Sentence 3.2.4.20.(2) of the Ontario Building Code at the West Park Long-Term Care Facility, 82 Buttonwood Avenue, Toronto, Ontario.

APPLICANT	Michael Bonnah G.M. of Operations & Logistics West Park Hospital
RESPONDENT	Bruce Ashton Chief Building Official City of Toronto
PANEL	Len King, Vice-Chair Fred Barkhouse Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	June 20, 2002
DATE OF RULING	June 20, 2002
APPEARANCES	Allan Larden Larden Muniak Consulting Inc. Toronto, Ontario **Agent for the Applicant** Sait Toprak Manager, Plan Review City of Toronto **Designate for the Respondent**

RULING

1. The Applicant

Michael Bonnah, G.M. of Operations & Logistics, West Park Hospital, has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is constructing a nursing home known as the Extendicare Long-Term Care Facility, West Park Hospital Site, 82 Buttonwood Avenue, Toronto, Ontario.

2. Description of Construction

The Applicant is completing construction of a nursing home facility having a Group B, Division 2 occupancy classification. The structure is three storeys in building height and 4,450 m^2 in building area. The facility will be equipped with both a sprinkler system and a fire alarm system.

The construction in dispute involves the visual signals required in addition to the requirements for fire alarm and smoke detection systems. It is proposed that a series of triple dome lights be located on the ceiling of the corridor in the immediate vicinity of each residential bedroom. A smoke detector located inside the residential room will actuate a red dome light in the corridor. The dome lights also activate when the nurses call buttons are pushed. A yellow light will appear if the nurses call is generated from the bathroom, a green light is illuminated if a call is initiated from the bedroom area.
In addition to the triple dome lights in the bedroom corridors, wall mounted alpha-numeric display devices will be located at the nurses call stations and will identify the room in which a signal has been activated. These devices are not listed by ULC as an ancillary device to the fire alarm system. The displays, however, will indicate the room number and simultaneously provide an indication of the type of signal that has been triggered. A ceiling mounted strobe light is also proposed at each nurses call station. These lights will be triggered if a smoke detector is activated anywhere in the area of the home in which the nursing station is situated.

Finally, it is proposed that an additional fire alarm annunciating device be located at the centrally located ground floor nursing station. This annunciating device will also identify the individual room in which a smoke detector has been activated.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed system of dome lights, together with the unlisted alpha-numeric display devices at the call stations, provide sufficiency of compliance with Sentence 3.2.4.20.(2) of the Ontario Building Code (OBC).

This sentence requires that, in addition to the requirements for fire alarm and detections systems, visual signals from smoke detectors located in sleeping rooms of a Group B occupancy, must be provided to allow staff to easily identify the room or location of the fire alarm initiation. In this respect, a series of dome lights and alpha numeric display devices referred to as a "Nurse Call System" are being proposed. As noted above, dome lights will be situated outside each sleeping room and will light with a red indicator if activated by a smoke detector. In addition, a signal will appear at the alpha-numeric displays located at each nursing station and at the centrally located ground floor nursing station. These signals will identify the individual room in which a detector has been activated.

The proposed alpha-numeric display devices, however, are not ULC listed. The system is not

electronically supervised by the building base fire alarm system nor is it provided with a dedicated back-up source of power.

4. Provisions of the Ontario Building Code

3.2.4.20. Visual Signals

(2) In addition to the requirements for fire alarm and detection systems in this Subsection, visual signals from *smoke detectors* required in sleeping rooms of Group B *occupancy* shall be provided so that staff serving those rooms can easily identify the room or location of fire alarm initiation. (See Appendix A.)

5. Applicant's Position

The Agent for the Applicant explained that the new nursing home is currently in the final stages of construction. It was during one of the final inspections that the design and function of the required visual signals was raised as an issue of concern by the Respondent. In January 2002 the Applicant was advised that a) the colour coding of the dome lights outside sleeping rooms was an issue, b) all of the dome lights could not be seen from the nursing stations, c) the alpha-numeric display system was not listed by ULC as an ancillary device to the fire alarm system, and d) the additional fire alarm annunciator at the ground floor nursing station did not satisfy the intent of the Code to require a visual display at each nursing station.

The Agent submitted that, in his opinion, Sentence 3.2.4.20.(2) requires visual signals in addition to the fire alarm system. These signals, he argued, need not be ULC listed and form part of the fire alarm system. He referred to the Appendix note in the Code and suggested that there were two methods of compliance available. The first would be to provide visual signals in the corridor at the location of each sleeping room. This would be appropriate if staff could see each sleeping room from one spot. If this was not possible, signals are to be provided where staff are expected to be present, i.e. the nursing station. In this regard, the Agent argued that the building in question had been designed by employing both methods of visual signals anticipated by the Appendix note.

The Agent for the Applicant explained that, because staff could not visualize all of the dome lights from one location, the alpha-numeric display would be used in conjunction with the corridor dome lights. He advised that staff of the facility are frequently walking through the corridors. As such, they felt is appropriate to use both types of visual signals to ensure the fastest possible response. In respect to the colour of the dome light on activation of a smoke detector, the Applicant argued that there is no basis for the Respondent's claim that the light should be amber in colour. He submitted that the red light proposed was more identifiable as an alarm or alert colour.

Furthermore, the Agent argued that there is no requirement in the Code for the visual signal devices to be ULC listed or to be considered part of the fire alarm system. He submitted that ancillary devices, such as these alpha-numeric display devices, are to be activated by the fire alarm system but are not required to be part of the fire alarm system. In referring to an extract from the ULC Standard, the Applicant noted that a fire alarm may include other devices such as voice communications. Strobe lights or other visuals could be added if desired. This, he argued, supported the position that there was no requirement that these ancillary devices be listed and form part of the fire alarm system.

In summation, the Agent submitted that the "Nurse Call System" proposed for this facility will serve

to visually identify the room in which a smoke detector has been actuated. The Agent stated that other long term care facilities have been constructed throughout the province that have been equipped with the type of system proposed here. The dome lights outside the individual rooms will provide a visual signal in addition to the alpha-numeric display at the nursing station. Furthermore, the annunciator panel to be provided at the ground floor nursing station will provide staff in this location with information regarding the activation of a detector. Staff throughout the facility are also supplied with pagers that would indicate the room number and priority level of an activated signal. The Agent submitted that the Applicant is voluntarily exceeding the minimum requirements of the Code by providing both the dome light system and the alpha-numeric displays. He reiterated that there is no provision in the Code to require these ancillary devices to be ULC listed.

6. Respondent's Position

The Designate for the Respondent submitted that, upon inspection of the facility, they had identified two areas of concern. Namely, the type of visual signals being proposed and the colour coding of those signals. The Designate advised the Commission that in 1990 the colour of visual signals became an issue with the Ministry of Health. In this respect he submitted that an amber signal has been the colour of choice for Toronto Fire Services in their effort to standardize operations with those of the Ministry, which has adopted this colour as being most appropriate.

In respect to the visual signal system itself, the Designate argued that these devices are marketed as life safety systems. Staff have to be able to respond to the signal and will come to rely on its accuracy and efficiency. He argued that, because it is not ULC listed, there would be no control over maintenance, inspection or monitoring.

As a way to ensure that the system is operating as designed, the Designate argued that it should be listed. To be consistent with past practices, the Designate stated that fire alarm annunciators at each nursing station, in addition to the alpha-numeric displays would satisfy their concerns. This would be a maintained system and part of the fire alarm system. Such a system would reliably alert staff immediately and would satisfy his concerns in respect to the potential for failure of the unsupervised system being proposed by the Applicant.

In summation, the Designate submitted that by relying on these visual signals as a life safety system it is appropriate to ensure its effective operation. If staff are not able to properly respond to a signal, the response time of the fire department may be affected. To ensure continued maintenance, monitoring and inspection it is, therefore, appropriate to require listed devices to satisfy the provisions of Sentence 3.2.4.20.(2).

7. Commission Ruling

It is the decision of the Building Code Commission that the use of unlisted, alpha-numeric display devices forming part of the call station located in the nursing stations provide sufficiency of compliance with Sentence 3.2.4.20.(2) of the Ontario Building Code at the West Park Long-Term Care Facility, 82 Buttonwood Avenue, Toronto, Ontario.

8. Reasons

i) The system of dome lights outside of each patient room, in addition to the alpha-numeric display devices, is sufficient to provide the visual signals required by Sentence 3.2.4.20.(2).

ii) The alpha-numeric display system will be used in conjunction with remote pagers supplied to the nursing staff which would identify the room where a smoke detector has been activated.

iii) An additional annunciator, which is capable of identifying individual smoke detector activation anywhere in the facility, is provided at the ground floor nursing station.

Dated at Toronto this **20th** day in the month of **June** in the year **2002** for application number **2002-07**.

Ruling No. 02-15-870
Application No. 2002-12

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentences 3.2.8.2.(5) and (6) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Darryl Boyce, Director of Physical Plant, for the resolution of a dispute with Arlene Gregoire, Chief Building Official, City of Ottawa, to determine whether the 6.75 m^2 light well opening interconnecting Levels 3, 4 and 5 and which does not include a stairway, escalator or moving walkway, but will be equipped with additional fire safety features, provides sufficiency of compliance with Sentences 3.2.8.2.(5) and (6) of the Ontario Building Code at the National Wildlife Research Centre, Carleton University, Raven Road, Ottawa, Ontario.

APPLICANT	Darryl Boyce, Director of Physical Plant Carleton University Ottawa, Ontario
RESPONDENT	Arlene Gregoire Chief Building Official City of Ottawa
PANEL	Kenneth Peaker, Chair Tony Chow Gary Burtch
PLACE	Toronto, Ontario
DATE OF HEARING	June 6, 2002
DATE OF RULING	June 6, 2002
APPEARANCES	Peter Colquhoun Arencon Inc. **Agent for the Applicant** Ron Mills Plans Examiner City of Ottawa **Designate for the Respondent**

RULING

1. The Applicant

Darryl Boyce, Director of Physical Plant, Carleton University, has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is constructing an addition to an exsiting building for use as a laboratory facility known as the National Wildlife Research Centre, Carleton University, Raven Road, Ottawa, Ontario.

2. Description of Construction

The Applicant is constructing a 1,140 m^2 addition to a Carleton University campus building referred to as the National Wildlife Research Centre (NWRC). The existing structure has a Group A, Division 2 occupancy classification and includes an 89 m^2 greenhouse component. The completed building will be 4,329 m^2 and four storeys in building height (Levels 2 to 5) plus one basement (Level 1) and a mechanical penthouse (Level 6). The NWRC component of the building will include Group D, office uses and Group F, Division 2, laboratories, mechanical and electrical service rooms and the existing greenhouse. The structure is comprised of noncombustible construction and is equipped with a sprinkler, standpipe and hose and fire alarm systems.

The basement level of the new addition will accommodate F2 occupancy uses and will be separated from the existing building by a 2 hour fire separation. Level 2, situated on the ground floor, consists entirely of offices and will be separated from the exsiting structure by a one hour fire separation. Levels 3, 4 and 5 include a combination of F2 and D uses. There is no fire separation required between the Group D and Group F, Division 2 major occupancies within the new addition and a convenience stair links the Group D portions of each floor area from Levels 2 to 5 (inclusive). The stair opening measures 13.5 m^2 in area. In addition to the convenience stair, the NWRC addition includes an adjacent light well opening, measuring 6.75 m^2 in area, which extend from Level 2 to Level 5. The combined area of the convenience stair (Stair No. 1) and light well openings in each floor assembly is approximately 20.25 m^2.

The construction in dispute is particular to the light well opening where it extends to interconnect Levels 3, 4 and 5 of the building, north of the convenience stair opening. The interconnection of Levels 2 and 3 has been accepted as Code compliant, however the interconnection of the further two floor areas is also being proposed. To compensate for the opening through these levels the Applicant is proposing that the light well be protected in the same manner as the convenience stair opening. These measures of protection include the provision of draft stops extending 457.2 (18 in) below the ceiling around the perimeter of the openings. In addition, close spaced sprinklers around the perimeter of the light well and stair openings as well as horizontal sprinklers on the western sidewall of the light well opening will be provided. The sprinklers protecting the openings will be connected to a separate zone from the floor area sprinklers. Further, intelligent multi-sensor smoke detectors will be placed around the perimeter of the openings at Levels 2, 3 and 4, which will be connected to the buildings fire alarm system.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether, provides sufficiency of compliance with Sentences 3.2.8.2.(5) and (6) of the Ontario Building Code (OBC).

Sentence 3.2.8.2.(5) provides that, except as permitted by Sentence (6) openings are permitted for stairs, escalators and inclined moving walkways without the need to conform to the requirements of 3.2.8.3. to 3.2.3.11 if the opening does not exceed 10 m^2 in area and if the building is sprinklered. A further requirement is that the interconnected floor space contain only Group A, Division 1, 2 or 3, Group D or Group E occupancies.

As an exception to this provision, Sentence (6) provides that an interconnected floor space need not meet the requirements of Articles 3.2.8.2. to 3.2.8.11. if the floor space consists of the first storey and the storey above or below it (but not both). Further, the interconnected floor space must be sprinklered and contain only Group A, Division 1, 2 or 3, Group D or Group E occupancies.

In the subject building, the floor areas in question contain Group D major occupancies and the building is fully sprinklered. The light well opening being disputed, however, does not contain either a stair, escalator or moving walkway. Moreover, the opening extends beyond the first storey and the floor above to incorporate all four above ground levels. In recognition of the technical requirements of the Code and to compensate for any discrepancy in this regard, the Applicant is proposing the provision additional fire safety measures. These include the provision of draft stops and placement of multi-sensor smoke detectors around the perimeter of the light well openings and the convenience stair openings at levels 2, 3 and 4. Close spaced water curtain sprinklers around the perimeter of the light well openings as well as horizontal side wall sprinklers on the west side of the openings are also being proposed. A separate zone for the sprinklers which protect the convenience stair and light well openings will be provided.

4. Provisions of the Ontario Building Code

3.2.8.2. Exceptions to Special Protection

(5) Except as permitted by Sentence (6), openings for stairways, escalators and inclined moving walks need not conform to the requirements in Articles 3.2.8.3. to 3.2.3.11. provided

(a) the opening for each stairway, escalator or walk does not exceed 10 m^2 (108 ft^2),
(b) the *building* is *sprinklered* throughout, and
(c) the *interconnected floor space* contains only Group A, Division 1, 2 or 3, Group D or Group E *occupancies*.

(6) An *interconnected floor space* need not conform to the requirements of Articles 3.2.8.3. to 3.2.8.11. provided

(a) the *interconnected floor space* consists of the *first storey* and the *storey* next above or below it, but not both,
(b) the *interconnected floor space* is *sprinklered*, and
(c) the *interconnected floor space* contains only Group A, Division 1, 2 or 3, Group D, Group E, or Group F, Division 3 *occupancies*. (See Appendix A.)

5. Applicant's Position

The Agent for the Applicant stated that the unenclosed light wells proposed in this building will facilitate the introduction of natural light through the floor areas. A skylight is situated at the top of the openings. He advised that the light well is located adjacent to the opening for the convenience stair and creates a combined opening area of approximately 20.25 m^2. He noted that the Building Code Commission had

previously found openings of up to 25 m^2 to provide sufficiency of compliance with the OBC.

The Agent submitted that the Respondent had already agreed to accept the interconnection between Levels 2 and 3, as well as the convenience stair opening through Levels 3, 4 and 5, despite the fact that the size of the stair opening marginally exceeds the Code specified maximum. The remaining dispute was particular to the 6.75 m^2 light well opening interconnecting Levels 3, 4 and 5. In this regard he submitted that the opening would be permitted if it contained a stair, escalator or moving walkway. He suggested that the hazard associated with the opening is the same whether one of these features was present or not, in terms of the possibility of fire gases passing through the opening.

To address any concern in this regard the Agent advised that the proposal included the use of intelligent multi-sensor smoke detectors around the perimeter of the light wells and the convenience stairs. These would be programmed below the required sensor levels to provide an early warning. He also stated that strategically placed horizontal sprinkler heads would provide additional protection to the openings. These sprinklers would be placed in a manner to facilitate the cooling of fire gases to less than 100 ^oF through evaporative cooling. Further, he submitted that the sprinklers would be linked to a separate zone to avoid the need to take them out of service when the floor area sprinklers are being serviced.

In summation, the Agent stated that there is some precedent for the Commission having accepted similar types of openings. Further, the Code he argued, does not limit the number of openings for convenience stairs, etc. In conclusion, he suggested that the compensating measures being proposed would adequately address the potential hazard associated with a light well opening and stated that the Fire Department had indicated that they did not consider these openings to be a problem from a fire fighting perspective. Sprinklering, he argued, would help to control the migration of smoke and gases through the openings.

6. Respondent's Position

The Respondent submitted that the subject openings do not contain either a stair, escalator or moving walkway making them subject to the exemption requirements of 3.2.8.2.(6) which permits the interconnection of the ground floor, in this case Level 2, and one storey up or down. To interconnect Levels 3 through 5 simply does not comply with the Code.

In considering the additional protection proposed for the opening and the previous BCC rulings, the designate stated that he was unprepared to consent to the argument of the Applicant for acceptance of the proposal. He stated that other Commission rulings were immaterial to this dispute as they were site specific applications and not precedent setting. He also submitted that the municipality had already accepted the stair well opening even though it was in excess of the OBC size requirements. In this regard, he felt the presence of a stair was important as it filled the opening and inhibited the movement of gases through the openings.

In summation, the Designate stated that the acceptance of alternative measures to compensate for the light well openings did not comply with the clear and prescriptive requirements outlined in the Building Code. The openings considered in previous BCC decisions all contained a stair, escalator or moving walkway as referenced in 3.2.8.3.(5). In this case, the increase in area is particular to an additional unprotected opening used merely as a light well. Further, the Designate advised that the building permit which was issued for this structure included the provision of tempered glass having a one hour fire resistance rating surrounding the opening. In his opinion this is a practical way to meet the Code requirements.

7. Commission Ruling

It is the decision of the Building Code Commission that the 6.75 m^2 light well opening interconnecting Levels 3, 4 and 5 and which does not include a stairway, escalator or moving walkway, but will be equipped with additional fire safety features does not provide sufficiency of compliance with Sentences 3.2.8.2.(5) and (6) of the Ontario Building Code at the National Wildlife Research Centre, Carleton University, Raven Road, Ottawa, Ontario.

8. Reasons

i) The opening in question does not contain a stairway, escalator or moving walk. The exception provisions outlined in Sentence 3.2.8.2.(6), therefore, do not apply.

ii) The fire safety measures offered to compensate for unenclosed openings extending beyond the first storey and the next storey above or below do not achieve sufficiency of compliance with Sentence 3.2.8.2.(6).

Dated at Toronto this **6th** day in the month of **June** in the year **2002** for application number **2002-12**.

Ruling No. 02-14-869
Application No. 2002-10

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 8.8.1.2.(1) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Peter Janzen, for the resolution of a dispute with Tom Cathcart, Chief Building Official, Peterborough County-City Health Unit, to determine whether the proposed installation of a Class 5 sewage system (holding tank) to serve a new cottage where the installation of a Code compliant Class 4 system is not possible, provides sufficiency of compliance with Sentence 8.8.1.2.(1) of the Ontario Building Code at 867 Southview Drive, Lot 12, Part Concession A, Township of South Monaghan, Peterborough County, Ontario.

APPLICANT	Peter Janzen St. Catharines, Ontario
RESPONDENT	Tom Cathcart Chief Building Official Peterborough County-City Health Unit
PANEL	Bryan Whitehead, Chair Bill Fellner Doug Robinson
PLACE	Toronto, Ontario
DATE OF HEARING	June 6, 2002
DATE OF RULING	June 6, 2002
APPEARANCES	Peter Janzen St. Catharines, Ontario **The Applicant** Kathleen Shepherd Public Health Inspector Peterborough County-City Health Unit **Designate for the Respondent**

RULING

1. The Applicant

Peter Janzen, has applied for a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is proposing to construct a cottage which will be serviced by a Class 5 sewage system on the property located at 867 Southview Drive, Lot 12, Part Concession A, Township of South Monaghan, Peterborough County, Ontario.

2. Description of Construction

The Applicant is the prospective purchaser of the subject property and is proposing to construct a three bedroom single detached dwelling for use as a cottage. The proposed dwelling would have a building area of 190 m^2 and 28.5 plumbing fixture units. The resulting total daily design flow is 2025 litres/day. It is proposed that a Class 5 holding tank will be installed to service the dwelling.

The lot in question is a lakefront lot and measures approximately 20.98 m (68.85 ft) in width and 32.26 m (105.85 ft) in depth. The property is undeveloped with the exception of a small shed having an area of less than 9.29 m^2(100 sq ft). In addition there is a dug well located near the easterly property line. A second well is located on an adjacent property also near the lot line.

The construction in dispute involves the proposed installation of a Class 5 septic system which the Code prohibits except in certain circumstances. The difficulty however, arises as a result of the size of the lot and the location of the two dug wells. Due to the specific position of these wells, a Class 4 system with treatment unit and disposal field can not be situated on the lot, together with the proposed cottage, and meet the minimum clearance distances set out in the Code.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the installation of a Class 5 system on the subject property provides sufficiency of compliance with Sentence 8.8.1.2.(1) of the Ontario Building Code (OBC) in light of the fact that it is not possible to install a Code compliant Class 4 system on site.

Sentence 8.8.1.2(1) sets out the conditions under which a Class 5 system may be installed. The intent of this Article seems to be to restrict the installation of new holding tanks unless extraordinary circumstances exist. Without conformance with the conditions outlined in this provision, Article 8.8.1.1. prohibits the installation of a Class 5 system. In the present case, the construction of a new cottage on a lot where no previous sewage system has been installed, does not appear to meet the conditions set out in the Code.

4. Provisions of the Ontario Building Code

8.8.1.2. Acceptable Installation

(1) A Class 5 *sewage system* may be installed in the following circumstances:

(a) where the proposed use of the *sewage system* is for a temporary operation, excluding seasonal recreational use, not exceeding 12 months in duration,

(b) to permit the extension of an existing single-family dwelling provided that
  (i) the extension will not increase the wastewater load, and
  (ii) the *building* is already served by a Class 5 *sewage system*,

(c) to remedy an unsafe *sewage system* where the remediation of the unsafe condition by the installation of a Class 4 *sewage system* is impracticable,

(d) to upgrade a *sewage system* serving an existing *building*, where upgrading through the use of a Class 4 *sewage system* is not possible due to lot size, site slope or clearance limitations, or

(e) as an interim measure for a lot or parcel of land until municipal sewers are available, provided that the municipality undertakes to ensure the continued operation of an approved *hauled sewage system* until the municipal sewers are available.

5. Applicant's Position

The Applicant submitted that he has entered into an agreement to purchase the subject lot conditional on his ability to obtain a building permit. As part of the permit process, he had encountered difficulty in obtaining approval for a septic system to service his proposed cottage in light of the existing restrictions on the property. He stated that, when considering the installation of a Class 4 system, it was discovered that the minimum clearances from the well on the neighbouring property could not be met. This meant that there would be no possibility for him to construct the building that he wanted served by a Class 4 system, and meet the separation distance set out in the Code.

As a solution to this problem, the Applicant advised that he approached the municipality with a proposal to install a Class 5 system on the site which would meet the separation distances for that type of installation. He argued that this is a reasonable solution and stated that approval of a holding tank is the only way this lot can be developed given the existing site restrictions. Without relaxation of the Code provisions, he submitted, nothing can be done with the property and it will essentially be sterilized.

The Applicant also suggested that, to his understanding, there was previously a cottage on the subject lot. He was informed, however, that this building had burnt down and there was no remaining evidence that it existed with the exception of the existing well at the easterly property line. This may have been a water source for any previous dwelling.

In summation, the Applicant emphasized that it was his desire to construct his "dream cottage" on this property. If he could receive a variance from the Code provisions and be permitted to install a Class 5 system he may be in a better position to approach the neighbouring property owner to discuss moving the problematic well. He could then consider installing a Class 4 system in compliance with the Code.

6. Respondent's Position

The Designate for the Respondent submitted that she received the permit application for the installation of a holding tank on the subject property. In her review of this application she considered the circumstances for acceptable installation outlined in the OBC. It was her position that this proposal did not meet any of the criteria whereby a Class 5 system could be approved.

The Designate stated that the parameters outlined in the Code are not new, they are merely new to the Building Code. In fact, the holding tank restrictions were in place for many years under the Ministry of the Environment. She acknowledged that a holding tank could be successfully located on the property to meet the Code requirements for a Class 5 system but maintained that such a system was not permitted in this instance.

7. Commission Ruling

It is the decision of the Building Code Commission (BCC) that the proposed installation of a Class 5 sewage system (holding tank) to serve a new cottage where the installation of a Code compliant Class 4 system is not possible, does not provide sufficiency of compliance with Sentence 8.8.1.2.(1) of the Ontario Building Code at 867 Southview Drive, Lot 12, Part Concession A, Township of South Monaghan, Peterborough County, Ontario.

8. Reasons

i) The proposed new construction does not meet any of the circumstances established by the Code in Sentence 8.8.1.2.(1) for acceptable installation of a Class 5 sewage system.

ii) The Building Code Commission does not have the authority to simply grant exemptions to the requirements of the Ontario Building Code. Under its statute, the Commission can make a determination on matters of interpretation and sufficiency of compliance with the technical requirements set out in the Code. In relation to its powers involving rulings of sufficiency of compliance, the Commission can examine matters of proposed or existing alleged deficiencies. The Code is viewed as a minimum set of health and safety standards and, where proposals are deficient in certain areas, the Commission looks for measures to compensate for that deficiency. In this instance, no compensating measures were offered that would allow for a ruling of sufficiency of compliance with the provisions of the Code.

iii) The BCC is of the view that the property may not be entirely sterilized. Options may be available for use of the land with lesser development than what is proposed.

Dated at Toronto this **6th** day in the month of **June** in the year **2002** for application number **2002-10**.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Articles 3.2.2.9. and 3.2.2.28. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Randi Glos, President, Randi Glos Architect Inc. for the resolution of a dispute with Edward J. Link, Commissioner of Building Development Services, City of Windsor, to determine whether the proposed additions that include crawl space areas which contain mechanical rooms housing HVAC equipment venting to the exterior is permitted to be governed by the construction requirements of Article 3.2.2.28. of the Ontario Building Code when considering Article 3.2.2.9. at the Jefferson Child Care Centre, 2605 Jefferson Blvd., Windsor, Ontario.

APPLICANT	Randi Glos President Randi Glos Architect Inc.
RESPONDENT	Edward J. Link Chief Building Official City of Windsor
PANEL	Kenneth Peaker, Chair Robert De Berardis Tony Chow
PLACE	Toronto, Ontario
DATE OF HEARING	May 23rd, 2002
DATE OF RULING	May 23rd, 2002
APPEARANCES	Randi Glos President Randi Glos Architect Inc. **The Applicant**

RULING

1. The Applicant

Randi Glos, President, Randi Glos Architect Inc., has applied for a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is proposing to construct two additions to an existing child care facility known as the Jefferson Child Care Centre, 2605 Jefferson Boulevard, Windsor, Ontario.

2. Description of Construction

The Applicant is constructing two new, separate additions to an existing building, having a Group A, Division 2 occupancy classification and operating as a child care facility. The existing structure has a building area of 392.79 m^2 (4228 ft^2) and a building height of one storey. The larger of the two additions, situated to the west of the existing structure, has a building area of 276.39 m^2 (2975 ft^2) while the smaller addition located at the north east corner of the existing structure has a building area of 79 m^2 (850 ft^2). Both additions will also be one storey in building height. The entire finished structure will encompass a building area of 748.18 m^2 (8,053 ft^2) and is sited such that it faces two streets. Further, the building is comprised of combustible construction and will be equipped with a fire alarm system.

The existing portion of the building contains a subsurface level which has been identified as a crawl space. Similarly, the two new additions will also contain subsurface areas which the Applicant has also referred to as crawl spaces. These areas provide a clear height of approximately 1676 mm (5 ft 6 in) to the underside of the floor joists. Within each of these two new subsurface spaces, mechanical rooms are proposed which will house high efficiency HVAC systems. These units have supply and exhaust piping which will penetrate the exterior wall of the subsurface level and the surrounding area will be compartmentalized from the remainder of the building by a one hour fire-rated separation.

The construction in dispute involves the classification of the subsurface areas of the new additions and the associated construction requirements involved. If considered to be "crawl spaces" there would be no requirement to separate the floor assembly above the area. However, if considered to be a "basement", a fire separation having a 45 minute fire-resistance rating would be required.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the subsurface level in the two new additions which includes mechanical rooms containing HVAC equipment can be considered to be a crawl space and permitted to comply with the requirements of Article 3.2.2.28, when considering Article 3.2.2.9. of the Ontario Building Code (OBC).

Sentence (1) of Article 3.2.2.28. permits a building having a Group A, Division 2 major occupancy classification to be constructed using combustible or noncombustible construction materials (or a combination of both), provided that the building height does not exceed one storey and the area meets the requirements relative to the number of streets the building faces. Further, Sentence (2) permits a building without a basement to exceed the building area limitations of Sentence (1) provided that a one hour fire separation is used to separate the building into fire compartments, each of which would not exceed the area requirements of Clause 1(b).

Sentence (1) of Article 3.2.2.9. mandates that, for the purposes of Articles 3.2.1.4. and 3.2.1.5., relative

to floor assembly and containment requirements for basements, a crawl space shall be considered to be a basement if it, a) exceeds 1,800 mm between the lowest part of the floor assembly and the ground or other surface below, b) is used for any occupancy, c) is used for the passage of flu pipes or, d) is used as a plenum in combustible construction. Sentence (2) of this Article provides that floor assemblies above a crawl space need not be constructed as a fire separation and are not required to have a fire-resistance rating provided that they are not considered basements by Sentence (1)

As noted, the subject day care facility is one storey in building height, having a Group A, Division 2 occupancy classification. Further, a subsurface level, designed as a crawl space, has been included in the construction of the new additions. While this level neither has the floor-to-ceiling height nor is to be used as a plenum, it is to contain an HVAC system with associated exhaust piping. In this light, the mechanical rooms will be separated from the remainder of the building by a one hour fire-rated separation.

The dispute in this respect involves whether the presence of HVAC systems within the subject crawl space requires that the area be considered a basement for the purposes of Articles 3.2.1.4. and 3.2.1.5.

4. Provisions of the Ontario Building Code

3.2.2.9. Crawl Spaces

(1) For the purposes of Articles 3.2.1.4. and 3.2.1.5., a crawl space shall be considered as a *basement* if it is

(a) more than 1 800 mm (5 ft 11 in) high between the lowest part of the floor assembly and the ground or other surface below,
(b) used for any *occupancy*,
(c) used for the passage of *flue pipes*, or
(d) used as a *plenum* in *combustible construction*.

(2) A floor assembly immediately above a crawl space is not required to be constructed as a *fire separation* and is not required to have a *fire-resistance rating* provided the crawl space is not required to be considered as a *basement* by Sentence (1).

3.2.2.28. Group A, Division 2, One Storey

(1) A *building* classified as Group A, Division 2 is permitted to be of *combustible construction* or *noncombustible construction* used singly or in combination, provided

(a) it is not more than 1 *storey* in *building height*, and
(b) except as permitted by Sentence (2), it has a *building area* not more than
  (i) 400 m^2 (4,310 ft^2) if facing one *street*,
  (ii) 500 m^2 (5,380 ft^2) if facing 2 *streets*, or
  (iii) 600 m^2 (6,460 ft^2) if facing 3 *streets*.

(2) In a *building* referred to in Sentence (1) without a *basement*, the *building area* limits of Sentence (1) are permitted to be doubled provided a *fire separation* with a *fire-resistance rating* not less than 1 h is used to separate the *building* into *fire compartments*, each one of which does not exceed the area limits of Clause 1(b).

5. Applicant's Position

The Applicant advised that the existing child care facility is doubling in size as a result of the two new additions which were currently under construction. The building, he advised, falls under the provisions of provisions of Article 3.2.2.28. In this respect, combustible construction material has been used and crawl spaces have been included beneath each of the new additions, similar to the crawl space beneath the existing building. Whereas, the majority of the crawl space area is not proposed to be separated from the storey above he stated, however, that two mechanical room compartments have been created within these crawl spaces each of which will be separated by a one hour fire-rated separation.

The Applicant stated that the mechanical room compartments that are being created represent approximately 7% of the crawl space area and will house high efficiency HVAC systems. These systems include supply and exhaust piping which will penetrate to the exterior of the crawl space wall assembly within the fire-rated compartment. He suggested that the heating appliances do not contain flue pipes, as defined by the Code because there is no connection to a chimney. Rather, the appliances have gas vents which exhaust warm vent gases. The Applicant further advised that the HVAC spaces and crawl spaces are equipped with heat detectors which will be connected to the monitored fire alarm system for the building.

The Applicant argued that, in his opinion, the areas can be considered crawl spaces for the purposes of applying Code requirements. He stated that the HVAC spaces are minimal and are separated from the remainder of the building by a one hour separation. He further advised that there was limited access to the crawl spaces and that service personnel would only need to gain entrance to the areas a few times a year. He stated that, to require these areas to be wholly constructed as a basement providing a 45 minute fire separation to the entire floor assembly above, would be impractical and cost prohibitive. These areas, he argued, function as crawl spaces despite the inclusion of the HVAC equipment within a small segment of the floor space.

In summation, the Applicant also advised that double the number of required exits are provided in the facility and that the anticipated occupant load for the building is relatively low in comparison to what would be permitted by the Code. Finally, he reiterated his position that the HVAC systems do not contain flue pipes and that the fire compartments created to house this equipment should be sufficient to allow the remainder of the floor area to be considered a crawl space.

6. Respondent's Position

The Respondent did not attend the hearing, the Commission instead relied on his written submission. He submitted that where a crawl space is used for any occupancy, it shall be considered as a basement. In his opinion, the presence of HVAC equipment in the crawl space area, despite the intended separation, represents the use of the space for an occupancy. As a result, he argued, the basement would be required to comply with the provisions of 3.2.1.4. and 3.2.1.5. of the Code.

7. Commission Ruling

It is the Decision of the Building Code Commission that the proposed additions which include crawl space areas containing mechanical rooms housing HVAC equipment which vents to the exterior are not permitted to be governed solely by the construction requirements of Article 3.2.2.28. of the Ontario Building Code when considering the provisions of Article 3.2.2.9. at the Jefferson Child Care Centre, 2605 Jefferson Blvd., Windsor, Ontario.

8. Reasons

i) The subsurface floor areas do not satisfy the requirements of Sentence 3.2.2.9.(1) for the purposes of Articles 3.2.1.4. and 3.2.1.5.

ii) The mechanical rooms which include HVAC equipment within a portion of the crawl space constitutes use of the space for an occupancy. Where this occurs, Clause 3.2.2.9.(1) requires the crawl space to be considered a basement.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Parts 2 and 11 of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Jameel Mohammed, property owner, for the resolution of a dispute with Dan Sayers, Chief Building Official, Township of Dysart et al, to determine whether the proposed renovation and repair of an existing residential structure provide sufficiency of compliance with the relevant provisions of Parts 2 and 11 of the Ontario Building Code at Part Lot 15, Concession 4, Township of Dysart et al, Ontario.

APPLICANT	Jameel Mohammed Property owner
RESPONDENT	Dan Sayers Chief Building Official Township of Dysart et al
PANEL	Len King, Chair-Designate Robert De Berardis Tony Chow
PLACE	Toronto, Ontario
DATE OF HEARING	March 21st, 2002
DATE OF RULING	March 21st , 2002
APPEARANCES	Jameel Mohammed Property owner **The Applicant** Dan Sayers Chief Building Official Township of Dysart et al **The Respondent**

RULING

1. The Applicant

Jameel Mohammed, property owner, has applied for a building permit under the *Building Code Act*, S.O. 1992, c.23, as amended, and is proposing to undertake renovations and repairs to an existing residential building located at Part Lot 15, Concession 4, Township of Dysart et al, Ontario.

2. Description of Construction

The Applicant is proposing to carry out renovations and repairs to a small Group C structure. The existing building is described by the Applicant as a single storey, two bedroom cabin having a floor area of approximately 60.4 m^2 (650 ft^2).

The construction in dispute involves the proposed renovations and repairs to this structure. The anticipated construction includes the addition of a crawl space and ductwork associated with a proposed new heating system. In addition, several repairs to the building are being contemplated. These repairs include the removal and replacement of siding and structural supports, installation of new windows, roofing and improvements to the building insulation.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed renovations and repairs provide sufficiency of compliance with the relevant provisions of Parts 2 and 11 of the Ontario Building Code (OBC).

Part 2 of the Code outlines the general requirements for construction while Part 11 provides direction with respect to the extension, material alteration or repair of existing structures. The Applicant proposes to renovate and repair the existing building to make the structure more habitable. A determination on whether the proposed work provides sufficiency of compliance with Parts 2 and 11 is being sought in this regard.

4. Provisions of the Ontario Building Code

Part 2 General Requirements

Please refer to the Ontario Building Code.

Part 11 Renovation

Please refer to the Ontario Building Code.

5. Applicant's Position

The Applicant advised that he purchased the subject property in 1992. At that time there were two residential buildings on the property, one of which was subsequently destroyed by fire. He initially applied for and received a building permit to construct a new dwelling to replace the one which was

destroyed, however, he was unable to complete construction because of financial difficulties. He is now interested in repairing and upgrading the smaller, 60.4m^2 (650 ft^2) dwelling for use as his residence. As such, he applied for a building permit to carry out the necessary construction.

The Applicant explained that he had not been issued a building permit for this work by the Respondent. According to the Applicant, the two reasons for this refusal, cited to him by the Respondent, were that the structure did not comply with the zoning by-law and that an incomplete permit application had been filed. The Applicant disputed both of these claims. He advised the Commission of provisions found in the *Planning Act* with respect to legal nonconforming uses. He argued that, by virtue of its existence, the subject building would fall under that category. The applicant then stated that the BCC should provide a ruling consistent with this argument, i.e., that the by-law does not apply because the building is considered a legal nonconforming use.

As further support for his position, the Applicant submitted that Article 2.1.1.6. is relevant to the proposed construction as the building has been in existence for more than five years. Furthermore, Sentence 11.3.1.1.(1) provides that where a building is materially altered or repaired, the performance level shall be at least equal to the performance level of the building prior to any work being undertaken. He argued that, based on these two provisions, the Respondent did not have any discretion to refuse the permit being requested.

When questioned about what information had been supplied to the municipality in connection with the recent permit application, the Applicant stated that he did not provide drawings or specifications because this is not a new house. He argued that the Respondent knew the building and should have had access to original construction drawings. He simply wanted to undertake repairs to damaged areas and provide a heating system for the structure.

6. Respondent's Position

The Respondent confirmed that a permit for the proposed work has not been issued to the Applicant. He outlined the provision of subsection 8(2) of the *Building Code Act*, and emphasized that a permit may not be issued where the proposal would contravene other applicable law or where an application is considered to be incomplete. In this instance he explained that it is the position of the municipality that the subject building is in contravention of the municipal zoning by-law and that the application for permit was substantially incomplete. There were no building plans supplied nor was there a detailed description of the work to be undertaken. A permit was, therefore, not issued for the proposed construction.

In addition to these concerns, the Respondent advised that there is also a dispute between the parties with respect to the septic system that would be required to serve this dwelling. He noted, however, that this matter was not the subject of the present hearing.

In summation, the Respondent emphasized that, in light of the deficiencies with the permit application and the outstanding issue with respect to zoning conformity, he is not in a position to issue a permit for the proposed work.

7. Commission Ruling

It is the decision of the Building Code Commission that, under 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended, the Building Code Commission (BCC) does not have the jurisdiction to

determine this dispute.

8. Reasons

i) Subsection 24(1) of the *Building Code Act*, provides the Building Code Commission with jurisdiction to resolve disputes:

- that are between a chief building official or building inspector and an applicant for, or holder of, a permit or a person to whom an order is given; and

- that concern the interpretation of, or the sufficiency of compliance with, the technical requirements of the Ontario Building Code.

In this case, the Commission acknowledges that there is a dispute between the Chief Official and the Applicant, however, the parameters of that dispute presently fall outside the consideration of the technical requirements of the Ontario Building Code.

ii) The primary contention between the parties is with respect to the local zoning by-law and it's applicability to the subject property. Determination of this issue is clearly not within the mandate of the BCC.

iii) Despite the Applicant's dissatisfaction with the Respondent's interpretation of Parts 2 and 11 of the Building Code, the Commission found that the permit application submitted to the municipality was incomplete and contained insufficient information to make an informed decision as to whether a technical dispute exists.

Dated at Toronto this **21st** day in the month of **March** in the year **2002** for application number **2002-03**.

AND IN THE MATTER OF an application by Matthew Stanton, Project Manager, PCL Constructors Canada Inc., for the resolution of a dispute with Frank Asta, Chief Building Official, Town of Oakville, to determine whether the combustible wood screen cladding proposed on the exterior of the north, east and south faces of a parking structure provides sufficiency of compliance with Sentence 3.1.5.5.(1), (2) and (3) of the Ontario Building Code at the Oakville Trafalgar Memorial Hospital Parking Garage, Oakville, Ontario.

APPLICANT	Matthew Stanton PCL Constructors Canada Inc. Mississauga, ON
RESPONDENT	Frank Asta Chief Building Official Town of Oakville
PANEL	Len King, Vice-Chair Gary Burtch Tony Chow
PLACE	Toronto, Ontario
DATE OF HEARING	March 14th, 2002
DATE OF RULING	March 14th, 2002
APPEARANCES	Les Muniak Larden Muniak Consulting Inc., Toronto, ON **Agent for the Applicant** Frank Asta Chief Building Official Town of Oakville **The Respondent**

RULING

1. The Applicant

Matthew Stanton, Project Manager, PCL Constructors Canada Inc., has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is constructing a parking garage to serve the Oakville Trafalgar Memorial Hospital, Oakville, Ontario.

2. Description of Construction

The Applicant is proposing the construction of a parking garage having an F3 occupancy classification and a building area of 4,200 m^2. The structure will be comprised of noncombustible construction and is five storeys in building height. A further two storeys, proposed below grade level, will be equipped with a sprinkler system.

The construction in dispute involves the wood screen combustible cladding proposed for use on the north, east and south faces of the parking structure. The proposed cladding would be comprised of western cedar that has a low combustibility level, however, the wall assembly has not been tested in accordance with CAN/ULC-S134 standards. The cladding would be positioned approximately 406 mm (16 in) from the exterior face of the structure and tied off to the parking structure at the top and mid-point. In addition, as compensation for the use of combustible cladding which has not been subjected to Code prescribed testing, a closed-head sprinkler system is proposed around the perimeter of the structure located at the downturn on each level of the parking garage. Sprinkler heads are to be positioned approximately 2.4 m (8 ft) on centres and will be activated in the event of a fire.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposal for combustible wood screen cladding on the north, east and west facings of the subject parking garage will provide sufficiency of compliance with Sentences 3.1.5.5.(1), (2) and (3) of the Ontario Building Code (OBC).

Article 3.1.5.5. sets out restrictions on the use of combustible components in the construction of exterior walls. Sentence (1) provides that, with exceptions not applicable here, an exterior non-loadbearing wall assembly which includes combustible components may be used in a building requiring noncombustible construction provided that a) the building is not more than three storeys in building height or b) is not more than six storeys if the building is sprinklered. As a further requirement, this sentence stipulates that the interior surfaces of the wall assembly must be protected with a thermal barrier and that the wall assembly must satisfy the criteria set out in Sentences (2) and (3) when subjected to testing in conforming with CAN/ULC-S134 standards.

In this regard, Sentences (2) and (3) prescribe that flaming on or in the wall shall not spread more than 5 m above the opening during the test procedure and that the heat flux during flame exposure on the wall assembly shall not be more than 35 kW/m^2 when measured at 3.5 m above the opening during the same procedure.

As noted above, the proposed combustible exterior cladding has not been tested in conformance with CAN/ULC-S134 "Standard Method of Fire Test of Exterior Wall Assemblies", however, testing has been conducted in accordance with CAN/ULC-S102 "Standard Method of Test for Surface Burning Characteristics of Building Materials and Assemblies". The Applicant argues that there is a good

correlation between these two tests when materials such as the proposed combustible cladding are being analysed. Results from the S102 test would appear to meet the parameters outlined in Sentences (2) and (3). Further, as an additional measure of fire protection for the wood cladding, a closed-head sprinkler system, which would be activated in the event of a fire, is also being offered as compensation.

4. Provisions of the Ontario Building Code

3.1.5.5. Combustible Components for Exterior Walls

(1) Except for an *exposing building face* required to conform to Sentence 3.2.3.7.(1) or Sentence 3.2.3.7.(4), an exterior non-*loadbearing* wall assembly that includes *combustible* components is permitted to be used in a *building* required to be of *noncombustible construction* provided

(a) the *building* is

(i) not more than 3 *storeys* in *building height*, or

(ii) not more than 6 *storeys* in *building height* if *sprinklered*,

(b) the interior surfaces of the wall assembly are protected by a thermal barrier conforming to Sentence 3.1.5.11.(3), and

(c) the wall assembly satisfies the criteria of Sentences (2) and (3) when subjected to testing in conformance with CAN/ULC-S134, "Standard Method of Fire Test of Exterior Wall Assemblies". (See Appendix A.)

(2) Flaming on or in the wall assembly shall not spread more than 5 m (16 ft 5 in) above the opening during the test procedure referenced in Sentence (1). (See Appendix A.)

(3) The heat flux during the flame exposure on a wall assembly shall be not more than 35 kW/m^2 (11,100 $Btu/ft^2 \cdot h$) measured 3.5 m (11 ft 6 in) above the opening during the test procedure referenced in Sentence (1). (See Appendix A.)

5. Applicant's Position

The Agent for the Applicant advised that the proposed parking garage was a part of the current redevelopment project for the hospital. The aim of providing the wood cladding was to make the design of the parking garage blend into the residential streetscape and to avoid creating what might appear to be a "concrete bunker". The Agent described the cladding as a series of interwoven telephone poles with lattice in between. This wall assembly, he submitted, would be applied to three sides of the 5 storey parking structure.

The Agent acknowledged the OBC requirement for testing in accordance with the CAN/ULC-S134 standards. He advised that this test has not been conducted because the Applicant had been unable to find a testing facility that was equipped to test a 5 storey high structure. Furthermore, he suggested that this test would be cost and time prohibitive. In support of this application, however, the Agent advised that a test had been conducted in accordance with CAN/ULC-S102 standards. He suggested that a "(c)correlation has previously been demonstrated between the CAN/ULC-S134 test on a 3-storey high wall assembly and the extended CAN/ULC-S102 test in the Steiner Tunnel Furnace." In support of this argument, testimony from a former ULC employee revealed that the two flame spread tests being considered operate on the same principal. The witness submitted that, if S134 is designed to test flame spread, then all the data needed to analyse the result of flame spread for the subject assembly could be gathered in the smaller, simpler, S102 tunnel test.
The Agent submitted that "the correlation developed previously between CAN/ULC-S102 and the

Standard CAN/ULC-S134 demonstrates that exterior claddings having 1.8 m of flame propagation in the extended Steiner Tunnel Furnace test perform favourably when tested on a 3-storey high wall assembly." Further, the Agent advised that "(t)he limited distance of flame propagation in the tunnel furnace over a prolonged period indicates that the wood screen will not propagate flame more than 5 m above the opening nor develop a heat flux exceeding 35 kW/m^2 above the opening during a 3-storey high wall test. As such, the wood screen will not contribute to fire growth on the exterior face of the parking structure beyond that permitted for exterior claddings that have demonstrated favourable performance when tested in accordance with the Standard CAN/ULC-S134."

The Agent advised that a sample of the lattice had been subjected to a tunnel test and was examined for a period longer than the standard test would require. In the Agent's view, he was satisfied that the results achieved in this test indicate that the wall assembly would perform well and would meet the requirements of CAN/ULC-S134. Moreover, despite the successful testing of the product, the Applicant is offering an additional measure of compensation for the use of combustible exterior wall components. To protect the wood screen, "a closed-head sprinkler system will be provided at the downturn on each level of the parking garage. The sprinkler heads will be spaced at approximately 8-foot OC and will activate in the event fire occurs within the parking structure." The Agent argued that, because the OBC "does not require the provision of a fire suppression system for combustible exterior cladding", this sprinkler system around the perimeter will contribute to the provision of an equivalent level of life safety to that of noncombustible exterior construction.

In summation, the Agent submitted that, in his opinion, the proposal meets the intent of the requirements of Sentence 3.1.5.5.(1) of the Code. The provision of the sprinkler system around the perimeter will provide protection to the combustible elements of the proposal. A thermal barrier is, in his opinion, being provided through the use of 1,117.6 mm (44 in) of concrete upstand at the exterior walls and the 406.4 mm (16 in) separation between the wood lattice and the main structure. Further, the comparable test that has been conducted illustrates that the cladding will perform to an acceptable degree during a fire.

6. Respondent's Position

The Respondent submitted that the proposed combustible wall assembly did not meet the requirements set out in Article 3.1.5.5. In his opinion, he could see no correlation between the required testing method of CAN/ULC-S134 and that of the much smaller test conducted using the CAN/ULC-S102 standard. Further, he advised that he could see no similarity of comparison in the results obtained from a closed horizontal test (S102) and the open vertical test anticipated by S134.

In summation, the Respondent argued that the proposed wood screening represented a substantial amount of highly combustible material which would contribute to the overall fire load of the building. He emphasized that the building was not fully sprinklered and questioned the benefit of sprinkler heads around the perimeter as proposed by the Applicant. In his opinion, sufficiency of compliance with the prescriptive requirements of Article 3.1.5.5. was not being provided.

7. Commission Ruling

It is the decision of the Building Code Commission that the combustible wood screen cladding proposed on the exterior of the north, east and south faces of the parking structure does not provide sufficiency of compliance with Sentences 3.1.5.5.(1), (2) and (3) of the Ontario Building Code at the Oakville Trafalgar Memorial Hospital Parking Garage, Oakville, Ontario.

8. Reasons

i) The entire building is not sprinklered as would be required by Clause 3.1.5.5.(1)(a).

ii) The interior surfaces of the wall are not protected in their entirety by a thermal barrier conforming to 3.1.5.11.(3).

iii) There are concerns with the sprinkler heads located along the perimeter of the building in regard to whether there would be a sufficient rise in temperature to activate the system.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 3.1.7.3.(2) and Clauses 3.1.8.1.(1)(a) and (b) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Peter C. Barbour, Fire Chief, Township of Seguin, for the resolution of a dispute with Wilbert Bethune, Chief Building Official, Township of Seguin, to determine whether the two hour fire separation between proposed A2 and existing F3 occupancies, that is penetrated by roof trusses (supported by the structural members of the separation), provides sufficiency of compliance with Sentence 3.1.7.3.(2) and Clauses 3.1.8.1.(1)(a) and (b) of the Ontario Building Code at the Humphrey District Fire Hall, 115 Highway 141, R.R. #2, Parry Sound, in the Township of Seguin, Ontario.

APPLICANT	Peter C. Barbour Fire Chief Township of Seguin
RESPONDENT	Wilbert Bethune Chief Building Official Township of Seguin
PANEL	Len King, Vice-Chair Gary Burtch Tony Chow
PLACE	Toronto, Ontario
DATE OF HEARING	March 14th, 2002
DATE OF RULING	March 14th, 2002
APPEARANCES	Peter Barbour Fire Chief Township of Seguin **The Applicant** Wilbert Bethune Chief Building Official Township of Seguin **Designate for the Respondent**

RULING

1. The Applicant

Peter C. Barbour, Fire Chief, Township of Seguin, has applied for building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is proposing a change in occupancy for the existing building to accommodate Group A, Division 2, assembly occupancy uses at the Humphrey District Fire Hall, 115 Highway 141, R.R. #2, Parry Sound, in the Township of Seguin, Ontario.

2. Description of Construction

The Applicant is proposing a change of use for the existing fire hall which is currently classified as a Group F, Division 3 occupancy. The proposal would provide for Group A, Division 2 assembly occupancy uses to be incorporated into the building, using the existing meeting room area, while maintaining the F3 classification for the remainder of the building. The existing structure has a building area of 755 m^2 and is one storey in building height. The building is comprised of a combination of combustible and non-combustible construction and is not equipped with either sprinkler or standpipe and hose systems. As part of the proposal for a change of occupancy, however, a fire alarm system is being proposed.

As noted, the portion of the building involved in the change of occupancy includes the existing meeting room and support rooms which are presently used by the Fire Department as accessory space to the primary fire hall functions. These areas are presently separated from the apparatus room/garage area by a wall which has been labelled as a two hour fire separation. While there are no other fire rated walls in the building, some of the doors and door frames throughout the building are rated. In the existing meeting room area, two exit doors lead directly to the exterior of the building. Further, an additional set of double doors lead through the main lobby and to another set of double doors providing an exit route to the outside. Two additional access to exit routes are provided from the lobby into the garage area and from the meeting room into the garage area. While these doors are not all presently equipped with panic hardware, the proposal includes the installation of same where it is deemed appropriate.

The construction in dispute is the existing wall assembly which would separate the apparatus room/garage area from the proposed assembly occupancy. While noting that the wall assembly has been labelled as a two hour fire separation, the wall as constructed, does not provide a true fire separation in as much as the ends of the roof trusses pierce the drywall and rest on the top plate of the wall. The points of penetration of the fire separation have been fire stopped and smoke dampers have been installed in the HVAC system. To compensate for the penetration of the required two hour fire separation, as noted above, a fire alarm system (not required by the Code) is proposed to be installed in the building.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the existing wall, designed to provide a two hour fire separation but which is penetrated by roof trusses, provides sufficiency of compliance with Sentence 3.1.7.3.(2) and Clauses 3.1.8.1.(a) and (b) of the Ontario Building Code (OBC).

Sentence 3.1.7.3.(2) mandates that interior vertical fire separations must be rated for exposure on each side. Further, Clauses 3.1.8.1.(a) and (b) require, with exceptions not applicable here, that the required

fire separation be continuous and rated as specified in the Code. For the construction in dispute, it is acknowledged that a one and a half hour fire separation is required between the existing F3 occupancy and the proposed A2 occupancy. Through an oversight at the time of construction, the existing interior wall which would separate the two uses, while labelled as a two hour fire separation, is penetrated by roof trusses. It, therefore, is not considered to be a continuous fire separating membrane. This was allowed to remain as part of the original construction, however, because the building had been classified as an F3 major occupancy with Group D subsidiary elements. With the present proposal to dedicate a portion of the building for public assembly uses, the fire separation requirement would apply. In this regard, to compensate for the penetration of the fire separation, the Applicant is proposing to install a fire alarm system in the building.

4. Provisions of the Ontario Building Code

3.1.7.3. Exposure Conditions for Rating

(2) *Firewalls* and interior vertical *fire separations* shall be rated for exposure to fire on each side.

3.1.8.1. General Requirements

(1) Any wall, *partition* or floor assembly required to be a *fire separation* shall
(a) except as permitted by Sentence (2), be constructed as a continuous element (see Appendix A), and
(b) as required in this Part, have a *fire-resistance rating* as specified (see Appendix A).

5. Applicant's Position

The Applicant submitted that at the time the building was constructed it was anticipated that the meeting room would be used by fire personnel only. The proposal now is to allow community groups to use the space for public functions. It was not until the proposal for a change in occupancy for this portion of the fire hall that the issue of the fire separation came to the forefront.

The Applicant acknowledged that the interior wall was supposed to have been constructed as a fire separation but stated that the penetration of the butt ends of the roof trusses onto the top of the wall assembly was missed upon inspection by building officials. In his opinion, this penetration is only a very minor concern and would not substantially compromise the fire separation. He suggested that a significant fire would have to occur before the disputed construction caused any problem. He further emphasized that occupants of the area have two direct exits available from the room leading directly to the outside and a further exit available which routes them through an exit from the lobby. He suggested that the installation of panic hardware on the doors and the proposed fire alarm system, which would not be required by the Code, would ensure the safety of the building occupants.

In summation, the Applicant stated that while the building was not designed by an architect, it has been reviewed by an architect who determined that the additional construction required to provide the continuous fire separation anticipated by the Code would be an extremely costly venture. They would be required to rate the other three walls of the apparatus room to protect the trusses to a two hour rating. He felt the measures being offered, together with any addition requirements the Commission may request, would provide a significant level of life safety for the occupants of the building. He further emphasized that the A2 portion of the building would generally be used for short durations of time and

that, users of the F3 occupancy portion are trained to a high level in response to fire emergencies.

6. Respondent's Position

The Respondent submitted that, at the time the building was constructed, the original intent had been to allow the public to use the subject meeting area. In this regard, Council had requested that an architect be employed in the design of the building. After further consideration, it was decided that the building would be used by fire department personnel only and the entire structure was subsequently classified as an F3 major occupancy with a Group D subsidiary component.

The Respondent acknowledged that the Building Department has accepted the disputed wall as constructed because the building was to be used for Fire Department related uses only. In review of this present proposal, however, he was not comfortable accepting the as-constructed wall as the necessary fire separation between the garage and the new A2 area. He stated that because the building was only between three and five years old, Part 11 of the Code could not be used in respect to this construction.

In summation, the Respondent advised that, despite the compensating measures being offered, he did not believe he was in a position to accept the as-constructed separation and was concerned with respect to the municipality's liability in this matter if it were accepted. He had recommended that the Applicant bring the matter before the Building Code Commission as a way to resolve this dispute and would rely on the Commission's judgement in this regard.

7. Commission Ruling

It is the decision of the Building Code Commission that the two hour fire separation between proposed A2 and existing F3 occupancies, that is penetrated by roof trusses (supported by the structural members of the separation), will provide sufficiency of compliance with Sentence 3.1.7.3.(2) and Clauses 3.1.8.1.(1)(a) and (b) of the Ontario Building Code at the Humphrey District Fire Hall, 115 Highway 141, R.R. #2, Parry Sound, in the Township of Seguin, Ontario on condition that:

a) The entire building be equipped with a fire alarm system.

b) The double doors at D3 and single door at D1 are to be equipped with doors having a 45 minute fire resistance rating and provided with panic hardware. In addition, doors D2, D21 and D3 are to be equipped with panic hardware.

c) The fire separation being provided, as shown on plan A4, is to be continuous from floor to ceiling.

8. Reasons

i) Fulfilment of conditions imposed will provide sufficiency of compliance with the requirements of the OBC.

ii) The original building design anticipated use of this area as a multi-purpose room for use by the Fire Department.

Dated at Toronto this **14th** day in the month of **March** in the year **2002** for application number **2002-04**.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Clause 3.3.1.10.(2)(a) and Subsection 3.1.16. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Frank Perras, President, Perras Distefano Construction Inc., for the resolution of a dispute with Barry Coleman, Chief Building Official, City of Cornwall, to determine whether the proposed inward swinging double doors would provide sufficiency of compliance with Clause 3.3.1.10.(2)(a) when considering Subsection 3.1.16. of the Ontario Building Code at United Tri-Tech Corporation, 550 Campbell Drive, Cornwall, Ontario.

APPLICANT	Frank Perras, President Perras Distefano Construction Inc. Cornwall, Ontario
RESPONDENT	Barry Coleman Chief Building Official City of Cornwall
PANEL	Kenneth Peaker, Chair Robert De Berardis Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	February 14, 2002
DATE OF RULING	February 14, 2002
APPEARANCES	Frank Perras, President Perras Distefao Construction Inc. Cornwall, Ontario **For the Applicant**

RULING

1. The Applicant

Frank Perras, President, Perras Distefano Construction Inc., has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is undertaking renovations to the United Tri-Tech Corporation building located at 550 Campbell Drive, Cornwall, Ontario.

2. Description of Construction

The Applicant is renovating a Group F, Division 3, low hazard industrial facility having a building area of 1,740 m^2 (18,730 ft^2). The existing structure is two storeys in building height and is comprised of noncombustible construction. The building is equipped with a sprinkler system, a fire alarm system and a standpipe and hose system.

The renovations being undertaken include the redesign of a vacant portion of the building for use as a production area on the second floor. The production area has been designed for a maximum occupant load of 45 people but, in practice, is intended to accommodate only 20 persons. It has been provided with two required exits, one leading directly to the exterior of the building and a stair providing access to ground level.

The construction in dispute involves the double exit doors which lead from the production area into the adjacent corridor. Specifically, the doors at issue are designed to swing inwards which would comply with the Code when considering the intended occupant load of 20 individuals within the production area. However, the production area also borders an adjacent cafeteria space with a designed occupant load of up to 185 persons (plans show seating for 116 individuals). As a result of this occupant load, the cafeteria is required to be provided with two separate exits. One of the required exits from the cafeteria leads through the production area and, subsequently, through the doors which are subject to this dispute. Consequently, it is the opinion of the Respondent that the exit doors from the production area to the corridor form part of the access to exit from the cafeteria and thus, should swing outward, in the direction of exit.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the inward swinging double doors provide sufficiency of compliance with Clause 3.3.1.10.(2)(a) when considering Subsection 3.1.16. of the Ontario Building Code (OBC).

Clause 3.3.1.10.(2)(a) requires that, with an exception not applicable here, a door that opens into a corridor providing access to exit from a room or suite shall swing in the direction of travel to the exit if the occupant load is more than 60 people. In this respect, the occupant load in the room from which the doors open is less than the 60 person benchmark established by the Code. However, the doors in question also form part of the access to exit from the adjacent cafeteria area.

When considering the occupant load specifications established in Section 3.1.16. the cafeteria could be occupied by up to 185 persons. Plans submitted with the Application show tables and chairs in this space to accommodate 116 non-fixed seats, however according to the Applicant, the anticipated use of the cafeteria is not expected to exceed 30 persons.

4. Provisions of the Ontario Building Code

3.3.1.10. Door Swing

(1) Except as permitted by Article 3.3.1.11., a door that opens into a corridor or other facility providing *access to exit* from a *suite*, or a room not located within a *suite*, shall swing on a vertical axis.

(2) Except as permitted by Article 3.3.1.11., a door that opens into a corridor or other facility providing *access to exit* from a room or *suite* shall swing in the direction of travel to the *exit* if the room or *suite* is used or intended for

(a) an *occupant load* more than 60,
(b) a *high hazard industrial occupancy*, or
(c) a *hazardous classroom* in an elementary or secondary school.

Section 3.1.16. Occupant Load

Please see Ontario Building Code

5. Applicant's Position

The Applicant submitted that it was his preference for the subject double doors to swing inward, into the production area. He explained that the corridor into which the doors lead frequently accommodates large production/testing equipment which must roll along the aisle. These units are quite expensive and, to prevent damage, it is preferable for the doors from this area to swing inward. In addition, the Applicant suggested that the equipment may also interfere with the operation of the doors themselves if they were to swing outward and advised that these doors are typically left closed.

In respect to accommodating the exiting requirements of the cafeteria, the Applicant argued that, although designed to accommodate 116 to 185 persons, the cafeteria generally accommodates 15 to 20 individuals, even during the lunch hour. He suggested that a maximum of 30 persons would use the cafeteria at any one time. In addition, he submitted that no food is prepared in this area and that vending machines were the only source of food provision. It is generally a space for those to sit and eat rather than a fully operational cafeteria, he argued.

In summation, the Applicant submitted that the occupancy for both areas would not likely exceed the 60 person maximum established by the Code. In addition, he advised that the building is provided with emergency lighting and is fully sprinklered. Furthermore, one of the exits from the production area leads directly to an exterior steel stair. The stair offers ground level access to occupants of this area exiting the building and is the closest means to exit the building from the door that leads from the cafeteria into the production area.

6. Respondent's Position

The Respondent chose not to attend the hearing. The Commission, therefore, relied upon his written submission only.

The Respondent argued that "the occupant load as per submitted and reviewed plans, show a production area with 45 persons and a cafeteria space with 116 non-fixed seats (tables and chairs). The maximum allowable design occupant load for this cafeteria space could be as high as 185 persons as per table 3.1.16.1." He argued that the "(t)he cafeteria space required two separate exists (sic) because of this occupant load and travel distance. This production area now serves as part of the access to exit (Door D36 and D51) serving a total of occupant load exceeding 60. Clause 3.3.1.10(2)(a) would apply and these access to exit doors must swing outwards in the direction of exit travel."

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed inward swinging double doors will provide sufficiency of compliance with Clause 3.3.1.10.(2)(a) when considering Subsection 3.1.16. of the Ontario Building Code at United Tri-Tech Corporation, 550 Campbell Drive, Cornwall, Ontario on condition that:

1. The cafeteria is to have a maximum occupant load of not more than 30 persons. A permanent sign indicating that occupant load shall be posted in a conspicuous location.

2. Floor line painting or the equivalent is to indicate to path of travel between door D51 (door to the exterior and stair to ground level) and D52 (cafeteria door opening into production area).

3. The production area shall have a maximum occupant load of 45 persons. A permanent sign indicating that occupant load shall be posted in a conspicuous location.

8. Reasons

i) With fulfilment of the conditions imposed above, sufficiency of compliance with the Code requirements will be provided.

ii) The second floor is considered to be a suite, as the area is used by a single tenant only.

iii) The second floor corridor is not considered to be a public corridor under the OBC since it does not provide access from more than one suite (OBC A-1.1.3.2.).

iv) There is no kitchen component to the cafeteria and it is not used for food preparation.

v) The building is fully sprinklered.

vi) Equipment traversing the aisle outside the production area may interfere with outward swinging doors.

Dated at Toronto this **14th** day in the month of **February** in the year **2002** for application number **2002-02.**

AND IN THE MATTER OF an application by Joan Ross, CEO, Northumberland Health Care Corporation, for the resolution of a dispute with Frank Lukes, Chief Building Official, Town of Cobourg, to determine whether the omission of a roof anchoring system, where window washing and maintenance is intended to be carried out from ladders with grade level access and where equipment is positioned to permit rooftop maintenance without approaching the parapet, provides sufficiency of compliance with Article 4.1.10.8 of the Ontario Building Code at Northumberland Health Care Corporation, 1000 De Palma Drive, Cobourg, Ontario.

APPLICANT	Joan Ross, CEO Northumberland Health Care Corporation Coburg, Ontario
RESPONDENT	Frank Lukes Chief Building Official Town of Cobourg
PANEL	Michael Steele, Chair-Designate Robert De Berardis Fred Barkhouse
PLACE	Toronto, Ontario
DATE OF HEARING	January 24, 2002
DATE OF RULING	January 24, 2002
APPEARANCES	Dan MacKay, Building Code Consultant Larden Muniak Consulting Inc., Toronto, Ontario **Agent for the Applicant** Frank Lukes Chief Building Official Town of Cobourg **The Respondent**

RULING

1. The Applicant

Joan Ross, CEO, Northumberland Health Care Corporation, Cobourg, Ontario, has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is constructing a care and treatment facility referred to as the Northumberland Health Care Corporation at 1000 De Palma Drive, Cobourg, Ontario.

2. Description of Construction

The Applicant is constructing a health care facility having a Group B, Division 2 occupancy classification. The building is 2 storeys in height and has a total building area of 10,145 m^2. It is comprised of noncombustible construction and will be equipped with fire alarm, sprinkler and standpipe and hose systems.

The building forms an irregular footprint and measures between 8.35 m to 8.7 m in height. Atop the building are three mechanical penthouses through which access from the building's interior to the roof surface is provided. Concrete pavers on the roof form a walkway between penthouses. Numerous window openings penetrate the exterior walls of the building, providing views from patient rooms and administrative areas on the two treatment floors.

The construction in dispute involves the omission of a rooftop anchor system where window cleaning and maintenance is intended to be carried out from the exterior of the building. Instead, it is intended that ladders, up to 13 m in length, will be used to conduct window cleaning and exterior maintenance. These ladders would be securely fastened or stabilized to prevent tipping or falling. In addition, rooftop equipment is positioned a minimum of 3 m from the edge of the roof such that maintenance can be carried out in this area from the roof surface.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposal to perform window washing and maintenance from ladders with grade level access and where rooftop equipment is positioned to permit its maintenance from the roof surface, provides sufficiency of compliance with the provisions of Article 4.1.10.8. of the Ontario Building Code (OBC).

This Article requires that, where maintenance and window cleaning are intended to be undertaken from the exterior of the building, an anchor system must be provided where any portion of the roof is more than 8 m above the ground level. The Article continues by describing the design and testing requirements for anchor systems and the composition of materials to be used. It also permits the use of other anchor systems provided that an equivalent level of safety will be provided.

For the building subject to this dispute, it is intended that maintenance and window cleaning activities will be performed from the exterior of the building. In addition, the height of the structure slightly exceeds the 8 m criterion outlined in the Code as being the height at which an anchor system shall be installed. Despite this, no anchor system is being proposed as it is the owners intention to carry out maintenance and window washing from ladders with grade level access. In addition, rooftop equipment has been set back from the parapet to allow for regular maintenance without the need to approach the edge of the roof.

4. Provisions of the Ontario Building Code

4.1.10.8. Anchor Systems on Building Exterior

(1) Where maintenance and window cleaning operations are intended to be carried out on the exterior of a *building* described in Article 2.1.1.2, anchor systems shall be provided where any portion of the roof is more than 8 m (26 ft 3 in) above adjacent ground level.

(2) Except as provided in Sentence (3), the anchor systems in Sentence (1) shall be designed, installed and tested in conformance with CSA Standard Z91, "Safety Code for Window Cleaning Operations".

(3) Other anchor systems may be used where such systems provide an equal level of safety.

(4) The anchor system material shall be made of stainless steel, aluminum, or other corrosion resistant base material, or from steel that is hot dipped galvanised, in accordance with CSA Standard G164-M81, "Hot Dip Galvanising of Irregularly Shaped Articles".

5. Applicant's Position

The Agent for the Applicant acknowledged that the Building Code requires a roof anchor system be provided where a building exceeds 8 m in height. He also acknowledged that the subject building exceeds this height, although marginally. He emphasized however that there are two contrary pieces of provincial legislation governing the matter of maintenance to the exterior of a building, namely the Ontario Building Code and the *Occupational Health and Safety Act*.

In this regard, he advised the Commission that the *Occupational Health and Safety Act* permits work to be carried out from ladders up to 13 m high. In addition, workers on ladders at this height are exempt from the requirement to be protected by a fall arrest system provided that the ladders are securely fastened or stabilized to prevent tipping or falling. He also argued that, in this *Act*, a fall arrest system is not prescribed in situations where workers are not required to come closer than 3 m to the edge of a roof that is located more than 3 m above the next highest surface. He submitted that both of these provisions are intended to be met in this situation. Ladders, he argues, will be secured and it has been demonstrated that all required maintenance can be undertaken from ladders or a surface not more than 3 m above the adjacent level.

As a further argument in support of the omission of an anchor system, the Agent submitted that Sentence 2.7.2.2.(1) of the OBC permits the use of systems not described in the Code provided that a level of performance is achieved in keeping with its intent. He suggested that ladders, and a program that limits access to the edge of the roof, will provide a level of performance in keeping with the intent of Article 4.1.10.8. In respect to the provision of equivalents, the Agent acknowledged that Section 2.7. excludes Part 4 requirements, however, Article 2.7.2.3., Building Designs, permits designs not specifically described in Part 4.

In summation the Agent submitted that, while the Building Code may require the installation of an anchor system, the *Occupational Health and Safety Act* does not require it to be used, provided that safe working practices are implemented. He suggested that, if installed, the anchors would not likely be used since the owners intend to conduct maintenance from ladders at ground level.

6. Respondent's Position

The Respondent submitted that the Code is specific in requiring that buildings exceeding 8 m in height be equipped with an anchor system when maintenance and window washing are to be carried out from the exterior. He argued that he did not consider ladders to be an alternative anchor system. The roof anchors are safety features and to accept anything less than the minimum Code requirement could potentially create an unsafe situation. The Building Code is intended to offer all available safety measures and if this building were to be permitted to exempt an anchor system, employees would not be afforded any choice in how to conduct their work.

In addressing the provisions of the *Occupational Health and Safety Act*, the Respondent argued that at no point does this *Act* exempt a building from being equipped with safety features required by the Building Code. In addition, he stated that the two pieces of legislation are not necessarily in conflict since the Ontario Building Code is meant to address new construction whereas the *Occupational Health and Safety Act* governs all existing working conditions. The building which is subject to this dispute is being newly constructed and therefore must comply with the provisions of the OBC.

7. Commission Ruling

It is the decision of the Building Code Commission that the omission of a roof anchoring system, where window washing and maintenance is intended to be carried out from ladders with grade level access and where equipment is positioned to permit rooftop maintenance without approaching the parapet, does not provide sufficiency of compliance with Article 4.1.10.8 of the Ontario Building Code at Northumberland Health Care Corporation, 1000 De Palma Drive, Cobourg, Ontario.

8. Reasons

i) Portions of the roof of the building complex are located such that they minimally exceed the requirement of 8 m above ground level. Sentence 4.1.10.8.(1) requires that, where this situation occurs, an anchor system shall be provided.

ii) No alternative anchoring systems or safety features were proposed which would allow for a finding of sufficiency of compliance with Article 4.1.10.8.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentences 3.2.3.7.(7) and (8) and Sentences 3.1.11.7. (1) and (2) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by David Sheps, Project Manager, Metro Toronto Housing Corporation, for the resolution of a dispute with Steve Franklin, Director, Building Division, East District, City of Toronto, to determine whether the proposed foam plastic insulation and metal cladding system provides sufficiency of compliance with Sentences 3.2.3.7.(7) and (8) when considering Sentences 3.1.11.7. (1) and (2) of the Ontario Building Code at 1021 Birchmount Road, Toronto, Ontario.

APPLICANT	David Sheps, Project Manager Metro Toronto Housing Corporation, Toronto, Ontario
RESPONDENT	Steve Franklin Director, Building Division East District City of Toronto
PANEL	Michael Steele, Chair-Designate Robert De Berardis Fred Barkhouse
PLACE	Toronto, Ontario
DATE OF HEARING	January 24, 2002
DATE OF RULING	July 16, 2002
APPEARANCES	Andrew Holford, Engineer Norman Lee & Associates Ltd. Markham, Ontario **Agent for the Applicant** Arthur Jammer Building Plan Examiner City of Toronto **Designate for the Respondent**

RULING

1. The Applicant

David Sheps, Project Manager, Metro Toronto Housing Corporation, Toronto, Ontario, has received an order to comply under the *Building Code Act*, S.O. 1992, c. 23, as amended, to remedy certain alleged deficiencies with respect to renovations conducted at 1021 Birchmount Road, Toronto, Ontario.

2. Description of Construction

The Applicant has undertaken certain renovations/repairs to an existing Group C, residential apartment building. The structure is 12 storeys in building height and 1922 m^2 (20,688 ft^2) in building area. It is comprised of noncombustible construction and is equipped with fire alarm and standpipe and hose systems.

The building is constructed of reinforced concrete slabs supported on concrete columns and walls. The exterior is brick veneer construction which is supported on the edge of the concrete slab at each floor level. The work that has been carried out on this building involved the repair of the concrete balconies and replacement of balcony railings. In addition, repairs to the building envelope have been undertaken, including the installation of new insulation and metal cladding to the exterior face of the top four floors on the eastern elevation of the building.

The construction in dispute involves the new insulation and metal cladding system and, specifically, the use of foam insulation beneath the metal clad exterior. As outlined in the Applicant's submission, the new cladding system and the remaining existing wall are comprised of the following components:

- "22 Gauge (0.76mm) flat sheet steel panels, profile to be AD-300 by VicWest;
- 2" Styrofoam blue board by Dow Chemical (Type IV insulation);
- L2x2x⅜" and L1-¾x1-¾x¼" angles anchored to the floor slabs with ⅜" Ø Hilti Kwik Bolts @ 24" c/c;
- ½" Stucco cladding;
- 4" clay brick;
- 4" concrete block;
- 1" foam plastic insulation (Type 1);
- 1" plaster
- Painted finish."

The issue in dispute with respect to this construction is whether the as-installed wall system is required to be tested in accordance with the provisions of the Ontario Building Code.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the as-installed insulation and metal cladding system will provide sufficiency of compliance with Sentences 3.2.3.7.(7) and (8) when considering Sentences 3.1.11.7. (1) and (2) of the Ontario Building Code.

Sentences 3.2.3.7.(7) provides that, with an exception not applicable here, and in addition to the requirements outlined in Sentences (2), (3), (5) and (6), foam plastic insulation used in the construction

of an exterior wall for a building more than 3 storeys in height shall be protected on its exterior surface by either concrete or masonry not less than 25 mm in thickness or by noncombustible material that complies with the criteria for testing and acceptance outlined in Sentence (8). The testing in this instance is required to conform to the CAN/ULC-S101-M "Standard Methods of Fire Endurance Tests of Building Construction and Material".

As noted, Sentence (8) of Article 3.2.3.7. outlines the criteria for testing and conditions of acceptance for a wall assembly that would satisfy the requirements of Clause (7)(b). These criteria and conditions include a) that the exposed area of the wall assembly shall be not less than 9.3 m^2 and have no dimension less than 2,750 mm, b) the exposed surface is to include typical vertical and horizontal joints, c) tests are to be continued for a minimum of 15 minutes following the standard time/temperature curve of the referenced standard, d) the noncombustible protective material will remain in place and no openings will develop that would be visible when viewed normal to the face of the material, and e) the same protective material will not disintegrate in a manner that would foster the spread of fire along the surface of the test assembly.

In respect to the subject construction in which foam plastic insulation has been used, the metal cladding has not been tested specific to the parameters outlined in Sentence 3.2.3.7.(8) and to the specified standard required in Sentence (7). The Applicant's position in this regard is that the 22 Gauge sheet steel being used as an exterior cladding is a noncombustible material that would provide sufficiency of compliance with the provisions of Sentences 3.2.3.7.(7) and need not be tested as outlined in Sentence (8). In support of the claim that the metal cladding would meet the intent of the Code the Commission is asked to refer to Sentences 3.1.11.7.(1) and (2).

Sentence 3.1.11.7.(1), in respect to Fire Stop Materials, requires that materials used to separate concealed spaces into compartments shall remain in place for a minimum of 15 minutes when subjected to the same ULC standard of fire exposure anticipated in Sentence 3.2.3.7.(7). Further, Sentence (2) of Article 3.1.11.7 provides that gypsum board not less than 12.7 mm thick and sheet metal not less than 0.38 mm thick does not require testing with the CAN/ULC standard provided that all joints have continuous support.

It is argued that these provisions, while not specific to the construction of an exposing building face, illustrate the compliance of the metal cladding material used in the protection of the foam plastic insulation subject to this dispute. As noted above, the sheet metal used in this instance is 0.76 mm in thickness and would meet the exemption for testing when considering the provisions outlined in Sentence 3.1.11.7.(2), but is not specifically noted in Sentence 3.2.3.7.(7) being the provision applicable to the construction in dispute.

4. Provisions of the Ontario Building Code

3.2.3.7. Construction of Exposing Building Face

(7) Except as permitted by Sentence (9), in addition to the requirements of Sentences (2), (3), (5) and (6), foamed plastic insulation used in an exterior wall of a *building* more than 3 *storeys* in *building height* shall be protected on its exterior surface by

(a) concrete or masonry not less than 25 mm (1 in) thick, or

(b) *noncombustible* material that complies with the criteria for testing and conditions of acceptance of Sentence (8) when tested in conformance with CAN/ULC-S101-M, "Standard Methods of Fire Endurance Tests of Building

Construction and Materials".

(8) The criteria for testing and the conditions of acceptance for a wall assembly to satisfy the requirements of Clause (7)(b) are that

(a) the fire exposed area of the wall assembly shall be not less than 9.3 m^2 (100 ft^2) and have no dimension less than 2 750 mm (9 ft),

(b) the exposed surface will include typical vertical and horizontal joints,

(c) the test shall be continued for not less than 15 min and the standard time/temperature curve of the referenced standard shall be followed,

(d) the *noncombustible* protective material will remain in place and no through openings will develop that are visible when viewed normal to the face of the material, and

(e) the *noncombustible* protective material will not disintegrate in a manner that would permit fire to propagate along the surface of the test assembly.

3.1.11.7. Fire Stop Materials

(1) Except as permitted by Sentences (2) to (4), materials used to separate concealed spaces into compartments shall remain in place and prevent the passage of flames for not less than 15 min when subjected to the standard fire exposure in CAN/ULC-S101-M, "Standard Methods of Fire Endurance Tests of Building Construction and Materials".

(2) Gypsum board not less than 12.7 mm (½ in) thick and sheet steel not less than 0.38 mm (0.015 in) thick need not be tested in conformance with Sentence (1) provided all joints have continuous support.

5. Applicant's Position

The Agent for the Applicant explained that an application for a building permit was submitted to the municipality for a retrofit of the subject building. As part of this retrofit, new cladding for the top four floors of the eastern building face was required. In this respect, the Agent advised that they conducted research as to an appropriate cladding system that would provide compliance with the provisions of the Ontario Building Code.

Resulting from this research it was decided that a cladding system which incorporated foamed plastic insulation covered with a 22 Gauge (0.76mm) steel cladding would be installed. Upon inspection by the City they were advised that this system would require testing as set out in Sentences 3.2.4.7.(7) and (8) of the OBC because of the use of foam plastic insulation. The Agent stated that, in his opinion, testing of this system is not necessary as the sheet steel being used as exterior cladding is a noncombustible material that would meet the requirements of the OBC and is, in fact, recognized as a material exempt from testing in Article 3.1.11.7. This Article in the Code refers to the same ULC standard as set out in the Sentences in dispute and states that, sheet steel not less than 0.38 mm thick need not be tested. The sheet steel in question, he argued, is two times thicker than the exempted material permitted by this Article.

In addition to having regard for this provision, the Agent contacted a representative of Bodycote Ortech Inc. who opined that the subject material would retain a significant amount of its original strength and that no phase change would occur at a temperature of 538°C. This is well above the 450°C required by the OBC. Also, the Agent advised that a technical advisor for Part 3 of the building code at the

Canadian Code Centre was contacted for an opinion. In his response the Agent was advised that it appeared as though the wall assembly in question would provide protection of the foamed plastic insulation to both the adjacent spaces in the building and protection on the exterior from fire spread up the facade.

The Agent argued that the intent of the Ontario Building Code was to ensure that the cladding being provided to protect foam plastic insulation would not disintegrate. The proposed system, which includes a 0.76 mm steel cladding will meet this intent, he argued. In addition, he submitted that "there are insulated wall panels constructed with similar materials and with similar configurations that have passed the requirements of CAN/ULC S-101-M. An example of such a panel is the Thermawall 1000 manufactured by Coldmatic Building Systems." He submitted that "(t)his insulated wall panel is constructed with foamed plastic insulation varying in thickness from 2" to 6" laminated between 2 layers of 26 Gauge (0.46mm) sheet steel and is listed as complying with ULC S-101."

As further support for this application, and at the request of the Commission, the Agent supplied as-built details of the metal exterior wall cladding system, safety data sheets of the foam plastic insulation, and other detailed information intended to ensure that the system would provide sufficiency of compliance with the requirements of the OBC. In summation, the Agent submitted that, based on the information contained in the Code, as well as information obtained from experts in the field, it was his opinion that the proposed cladding system would stay in place and not disintegrate and would meet the testing requirements outlined in the OBC.

6. Respondent's Position

The Designate for the Respondent submitted that the cladding system used on the eastern elevation of this 12 storey building did not meet the requirements as set out in the OBC in terms of testing to ensure that exterior protection is provided. The foam plastic insulation used in the installation is an extremely flammable and toxic material and must be adequately protected, he argued. In this regard the Building Code provides for either a masonry exterior surface or a noncombustible material that is ULC listed, thus meeting the appropriate standard.

The Designate argued that a full size test, including joints in the assembly, would be required to determine whether the metal cladding meets the Code standards. He emphasized that the city has never given a prior approval for this type of system. In all cases, they would have required the insulation to be replaced with a noncombustible material.

In respect to the Applicant's argument that the material meets the equivalency standards, the Designate stated that, in addition to not having enough information to make such a determination, he also did not have the authority to consider equivalence in this instance. Where the Code sets out specific test procedures that must be undertaken to ensure compliance, he must ensure that the criteria are met and all concerns have been addressed prior to approval.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-installed foam plastic insulation and metal cladding system does not provide sufficiency of compliance with Sentences 3.2.3.7.(7) and (8) when considering Sentences 3.1.11.7.(1) and (2) of the Ontario Building Code at 1021 Birchmount Road, Toronto, Ontario.

8. Reasons

i) The wall assembly has not been tested in accordance with the requirements of the Building Code.

ii) The Commission has concern with respect to the thermal protection of the foam plastic insulation, particularly at window openings.

iii) The wall assembly contains combustible material that has a maximum use temperature of 165°F and is specified by the manufacturer to avoid temperatures of 572°F.

iv) If exposed to fire or heat dense smoke will be produced and flame spread will develop. Adequate protection must be provided to ensure this does not occur.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 9.8.8.5.(1) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Luigi Mongillo, President, Mongillo Construction Ltd., for the resolution of a dispute with John Wright, Chief Building Official, Town of Markham, to determine whether the as-installed design of the vertical steel pickets, which includes ornamental "birdcages" and "rosettes" set at a spacing of 55.5 mm (2 3/16 in) for a guard on a horizontal surface and slightly less for a guard serving a stair, complies with the intent of Sentence 9.8.8.5.(1) of the Ontario Building Code at 26 and 28 Lee Avenue, Markham, Ontario.

APPLICANT	Luigi Mongillo, President Mongillo Construction Ltd. Markham, Ontario
RESPONDENT	John Wright Chief Building Official Town of Markham
PANEL	Len King, Vice-Chair John Guthrie Gary Burtch
PLACE	Toronto, Ontario
DATE OF HEARING	January 17, 2002
DATE OF RULING	January 17, 2002
APPEARANCES	Michael Lio Lio & Associates Toronto, Ontario **Agents for the Applicant**
	Fabio Di Mambro Canadian Railings Concord, Ontario
	Anthony Boyko Chief Building Official Town of Markham **Designate for the Respondent**

RULING

1. The Applicant

Luigi Mongillo, President, Mongillo Construction Ltd., has received an order to comply under the *Building Code Act*, S.O. 1992, c. 23, as amended, to remedy certain alleged deficiencies with respect to the construction of two residential dwellings at 26 and 28 Lee Avenue, Markham, Ontario.

2. Description of Construction

The Applicant is constructing two Group C single detached dwellings. Each building is two storeys in height with a building area of 388 m^2.

The construction in dispute involves the design of the guards serving the main stairs of the house and the second floor landings. The as-installed guards are comprised of square metal pickets spaced 101.6 mm (4 in) on centre with decorative elements at their mid-points. The two types of decorative elements are described as "bird cages" and "rosette knobs". The bird cage features are 203.2 mm (8 in) high and project 19.05 mm (¾ in) from the sides of the picket, at an angle of greater than 30° from horizontal. These elements are not installed adjacent to one another, but rather, occur on every fourth picket, at the same height as the decorative rosette knob located on either side. This rosette feature measures 50.8 mm (2 in) in height and projects 14.29 mm ($^{9}/_{16}$ in) from the edge of the picket, also on an angle greater than 30°. These knobs are positioned adjacent to one another as well as adjacent to the bird cage elements.

As a result of these projections, spacing between the decorative elements at the mid point of the pickets ranges from 55.5 mm to 70 mm for the guards located at the landings. Spacing between the elements is slightly less where the guard serves the stairways. Pickets at these locations are more closely spaced, because of the need to have at least two pickets situated side by side on the run of each stair.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the as-installed guards with decorative elements at their mid-point which are spaced a minimum of 55.5 mm apart, provide sufficiency of compliance with Sentence 9.8.8.5.(1) of the Ontario Building Code (OBC).

This provision stipulates that required guards must be designed in such a way so as not to facilitate climbing between 100 and 900 mm above the floor or walking surface of the area the guard is protecting. The issue at dispute is whether the guards as designed and installed will facilitate climbing.

4. Provisions of the Ontario Building Code

9.8.8.5. Design to Prevent Climbing
(See Appendix A.)

(1) *Guards* required by Article 9.8.8.1. and serving *buildings* of *residential occupancy* shall be designed so that no member, attachment or opening located between 100 mm (4 in) and 900 mm (2 ft 11 in) above the floor or walking surface protected by the *guard* will facilitate climbing.

5. Applicant's Position

The Applicant's Agent provided the Commission with some background in respect to the difficulties that have faced railing manufactures across the province as a result of the inconsistency in interpretation of Article 9.8.8.5. of the Ontario Building Code. He suggested that a Commission ruling on the interpretation of this provision would he helpful in providing guidance and clarity in respect to the issue of climability. The Agent submitted that, in light of recent interpretations by some building officials and the Building and Development Branch of the Ministry of Municipal Affairs and Housing (MMAH), many traditionally approved guard designs are now being rejected because of their perceived climbability. In this regard he emphasized that, while not looking to compromise safety, he felt there was a need for some flexibility in design.

The Agent submitted that the intent of the Article in question was to not entice or to make it easy for someone, particularly a child, to climb a guard. He argued that, in this regard, it was not the intent of the provision to prevent or prohibit climbing. This, he submitted, would be a near impossible task given the dexterity of children of varying ages. The Agent provided the Commission with an analysis of the abilities of children at different ages and suggested that, the prime concern would be in respect to a child at age two to three. A one year old child would not have the physical strength or coordination to pull up and over a barrier, he submitted. Once a child reached the age of three to four they would likely be able to climb any guard using knees and feet but would exercise more judgement and recognize the danger associated with their activities.

When examining a guard design in relation to the creation of a toe hold for a two to three year old child, the Agent presented evidence that the average shoe of a child this age would have a sole width of approximately 70 mm. He suggested that a 50 mm distance between protrusions having a sloped edge greater than 30º would not be sufficient to facilitate a toe hold for a child within that age range. They simply would not have sufficient surface on which to stand and pull themselves over. This 50 mm distance between protrusions, incorporating a sloped edge, is less than the 80 mm suggested by the MMAH as being the minimum distance between protrusions. This minimum he argued is not reasonable when considering the foot widths of small children.

Again the Agent emphasized that the intent of this Article was to not *entice* children to climb the guard. It is felt that 50 mm between protrusions is sufficient to meet the intent of this OBC requirement. The 80 mm suggested by the Ministry, he stated, is creating havoc in the railing industry. In fact, requiring an 80 mm opening would not be possible in many traditional picket designs. In fact, it has never been questioned for traditional wooden railing designs, it is only now becoming more of an issue since iron pickets are again becoming more popular.

The Agent also advised that data gathered from Health Canada in respect to statistics on injuries resulting from falls in the home indicates that one in four injuries is a result of falling down basement stairs. Others result from tripping while running on hard surfaces or while carrying objects. Falls from windows were also noted as being rare, but serious. The statistics, he noted, did not mention climbing up and over a guard as being of great concern. From a risk point of view he suggested that other household features were more hazardous.

In summation, the Agent reiterated that, when considering the intent of the Article in dispute, the application was primarily in reference to children and their ability to climb. The Ministry position that has been circulated doesn't take into consideration the judgement and awareness of older children. He stated that the guard design anticipated by this application clearly meets the intent of the Code. The decorative protrusion at the mid point of each picket, being more than 50 mm apart and at an angle of

more than 30°, will not entice or encourage children to climb the guard.

6. Respondent's Position

The Respondent submitted that two orders to comply had been issued for the properties subject to this hearing. In his opinion the guard that has been installed in these two dwellings does not meet the intent of this objective-based Code provision. This intent, as stated, is to ensure that no attachment between 100 mm and 900 mm above the floor will facilitate climbing. The protrusions at the mid-point of the picket are clearly within this climbing zone. He advised that he would have accepted a modified design containing the rosette feature provided that the rosettes were offset with a straight edge on an adjacent picket. This would provide the clearance level anticipated in Ministry communication which suggested that 80 mm distance between protrusions would be the minimum acceptable.

The Respondent advised that this matter has been discussed at a number of meetings but no measurement could be agreed upon as to what, in fact, would be acceptable from a design standpoint. He felt this would be an excellent test case in which to determine wether angled decorative features as close as 50 mm to 60 mm would be appropriate. However, it remained his position that the as-installed guard may facilitate climbing and therefore would not meet the intent of the Code.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-installed design of the vertical steel pickets, which includes ornamental "birdcages" and "rosettes" set at a spacing of 55.5 mm (2 3/16 in) for a guard on a horizontal surface and slightly less for a guard serving a stair, complies with the intent of Sentence 9.8.8.5.(1) of the Ontario Building Code at 26 and 28 Lee Avenue, Markham, Ontario.

8. Reasons

i) The standard of performance set out in Sentence 9.8.8.5.(1) is not to prevent climbing. Rather, it is to avoid the facilitation of climbing, which, we hold is to make climbing easier and more inviting. Moreover, it is not the intention of this provision to preclude all design elements from vertical guard pickets. It is simply to prevent the installation of guards with designs that increase the likelihood of guard climbing hazards.

ii) Based on the above, the BCC maintains that certain types of vertical picket ornamentation can protrude into the space between pickets without facilitating climbing.

iii) Considering the present picket example found at 26 and 28 Lee Avenue, Markham, Ontario, that proposes an alternating pattern of birdcage and rosette decorated pickets with a space of 55.5 mm (2 3/16 in) between them, the design does not facilitate climbing since:

   a) the space between decorations is enough that young children (1 to 3 years of age) will experience great difficulty in gaining a foothold;

   b) the alternating of birdcages and rosettes creates uneven protrusions from the pickets also makes securing a foothold problematic; and,

   c) the birdcages and rosettes protrude from the pickets at an angle of greater than 30^0

below horizontal which will reduce foot grip as well.

iv) The design presents no more of a climbing hazard than guards constructed of wood pickets which have similar spaces between the decorative protrusions of the pickets.

Dated at Toronto this **17th** day in the month of **January** in the year **2002** for application number **2001-80**.

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Clause 3.11.3.1.(9)(a) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Peter Bryk, Executive Director of Engineering, Howard Johnson/Ritz Motel Limited, for the resolution of a dispute with Mel Brown, City of Niagara Falls, to determine whether the removal of the interior and exterior bridges, which form part of the continuous pool deck and facilitate the crossing of a 1752.6 mm (5 ft 9 in) portion of a seasonally divided pool, provides sufficiency of compliance with Clause 3.11.3.1.(9)(a) of the Ontario Building Code at the Howard Johnson hotel, 5905 Victoria Avenue, Niagara Falls, Ontario.

APPLICANT	Peter Bryk, Executive Director of Engineering Howard Johnson/Ritz Motel Limited Niagara Falls, Ontario
RESPONDENT	Mel Brown Chief Building Official City of Niagara Falls
PANEL	Len King, Vice-Chair John Guthrie Gary Burtch
PLACE	Toronto, Ontario
DATE OF HEARING	January 17, 2002
DATE OF RULING	January 17, 2002
APPEARANCES	Peter Bryk, Executive Director of Engineering Howard Johnson/Ritz Motel Limited Niagara Falls, Ontario **The Applicant** Robert Romanuk Manager of Inspection Services City of Niagara Falls **Designate for the Respondent**

RULING

1. The Applicant

Peter Bryk, Executive Director of Engineering, Howard Johnson/Ritz Motel Limited, has received an order to comply and has applied for a demolition permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, in respect to the removal of two bridges that span portions of a seasonally divided swimming pool at the Howard Johnson hotel, 5905 Victoria Avenue, Niagara Falls, Ontario.

2. Description of Construction

The Applicant is the Executive Director of Howard Johnson/Ritz Motel Ltd., owners of a hotel property in Niagara Falls. The building is classified as a Group C major occupancy. It is comprised of noncombustible construction and is equipped with a fire alarm system.

The hotel also accommodates a swimming pool which is subject to this dispute. The pool combines two, kidney shaped areas. One indoors and the other outdoors. The maximum water depth of the pool is approximately 1,524 mm (5 ft) at its deepest point. As a combination indoor/outdoor facility the two pool elements are connected by a swim-through water channel which allows users to travel between the indoor and outdoor portions. The channel measures 1,752.6 mm (5 ft 9 in) wide and is 2,006.6 mm (6 ft 7 in) long on the interior portion of the pool and 1,854.2 mm (6 ft 1 in) in length on the exterior. It connects the two larger, kidney shaped segments. During times of inclement weather, the water channel can be blocked by a retractable plexiglass gate. When in place, this barrier serves to divide the pools such that the indoor area can be used independent from the outdoor area, essentially creating two pools. A windowed wall separates the indoor and outdoor pool areas. A set of outward swinging double doors, equipped with panic hardware, is situated on one side of the water channel and provides access to the pool deck between the two areas.

The construction in dispute involves two arched bridges which cross the swim-through water channel on either side of the windowed wall. These bridges were originally constructed to provide a continuous deck around each area of the pool. The water depth beneath the bridges is approximately 1,270 mm (4 ft 2 in) and a clearance of 2,133.6 mm is provided from the underside of the bridge to the bottom of the pool. The Applicant has presently removed the indoor bridge and is proposing the removal of the outdoor bridge as well. Demolition of these features has been requested in that they are viewed as a safety hazard to patrons of the pool. As compensation for removal of the bridges it is proposed that additional life safety equipment will be situated on the pool deck so that a ring buoy and 3.66 m (12 ft) rescue pole are available on both sides of the narrow channel where the bridges would have crossed.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the removal of the interior and exterior bridges, which facilitate the crossing of a 1752.6 mm (5 ft 9 in) portion of a seasonally divided pool and form part of the continuous pool deck, provides sufficiency of compliance with Clause 3.11.3.1.(9)(a) of the Ontario Building Code (OBC).

This Clause stipulates that, with exceptions not applicable here, a public pool shall be surrounded by a hard-surfaced pool deck that is at least 1,800 mm wide. The width of the deck is permitted to be reduced behind diving boards or structural columns provided that a passageway measuring 900 mm is

maintained.

In the subject case, in light of the unique configuration of the divided indoor/outdoor pool, the bridges proposed for removal are considered to form part of the continuous pool deck, allowing passage over the narrow channel of water connecting the indoor and outdoor pool areas. Measures to compensate for the removal of the bridges are being proposed by the Applicant in attempt to provide sufficiency of compliance with the OBC requirements.

4. Provisions of the Ontario Building Code

Sentence 3.11.3.1. Construction Requirements

(9) Except for a *modified pool* and *wave action pool* and except as provided in Sentence (11), a *public pool* shall be surrounded by a hard-surfaced *pool deck* that shall

(a) except for a pool described in Sentence 3.11.5.1.(1), be not less than 1 800 mm (5 ft 11 in) wide and provide at least 900 mm (2 ft 11 in) width of clear passage,
  (i) behind any *diving board* and its supporting structure, and
  (ii) between any column piercing the deck and the edge of the pool or between the column and outer perimeter of the *pool deck*,

(b) in the case of an *outdoor pool*, be sloped away from the pool to waste drains or to adjacent lower ground at a slope of between 2% and 4%, and

(c) in the case of an indoor pool, be impervious and sloped away from the pool to waste drains at a slope of between 1% and 4%.

5. Applicant's Position

The Applicant submitted that in removing the existing bridges the aim is to improve safety within the pool areas. He advised that the indoor bridge, in particular, was a safety hazard and as a result, it has already been removed. As a result of this action, an Order to Comply was issued and it was at that time that he discovered that the bridge was considered to form part of the continuous pool deck. He has since applied for a permit to demolish both the indoor and outdoor bridges.

The Applicant stated that the bridges were considered to be hazardous by hotel management because children have been known to climb on top of the bridge guards and jump off into the water. In addition, bathers are not visible when underneath the bridges causing further safety concerns where rescue may be required. Further, it would be difficult to reach an individual located in the corner of the swim-through channel when the plexiglass gate is in place. The bridge itself would be an obstacle to any rescue effort in that area.

The Applicant recognized that the bridges were considered to be part of the continuous pool deck and, as compensation for their removal, he was offering measures to ensure the safety of those using the pool. He suggested that, since the channel is only 5 ft 9 in wide and 4 ft 2 in deep, rescue could be easily facilitated from either side of the channel. He was therefore offering to provide an additional 12 ft reach pole and ring buoy so that one set of rescue equipment was situated on both sides of the channel. When questioned about additional compensation, the Applicant stated that he would also agree to install a door to the exterior, equipped with panic hardware, to facilitate deck access to the outdoor area from both sides of the water channel.

In summation, the Applicant reiterated that safety was the prime focus of his argument. The bridges he submitted, particularly the bridge spanning the indoor portion of the channel, pose a safety hazard to those using the pool. In his opinion, with implementation of the compensating measures being offered, safety in the pool would be increased as a result of the removal of one or both of the bridges.

6. Respondent's Position

The Designate for the Respondent advised that the subject pool was built in 1987/1988, prior to the construction requirements for public pools being incorporated into the Ontario Building Code. In this regard, there was some general discussion with the Ministry of Municipal Affairs and Housing as to how to accommodate a continuous pool deck in pools with swim-through channels. As a result of these discussions the suggestion was made to include the subject bridges which would span the channel and connect both sides of the pool.

In respect to the municipality's position on removal of the bridges, the Designate submitted that he considers them to form part of the pool deck which is required to surround the pool. He acknowledged that the bridges may create their own set of problems but was concerned that, by permitting their removal, a precedent may be set.

7. Commission Ruling

It is the decision of the Building Code Commission that:

a) the removal of the interior bridge will provide sufficiency of compliance with Clause 3.11.3.1.(9)(a) of the Ontario Building Code subject to the following conditions:

i) An additional door (equipped with panic hardware) leading to the outdoor pool deck must be installed. This door is to be located along the windowed portion of the pool deck where access is currently not available.

ii) An additional life saving ring and reach pole are to be provided to ensure safety equipment is available on both sides of the water passageway.

b) the removal of the exterior bridge does not provide sufficiency of compliance with Sentence 3.11.3.1.(9) of the Ontario Building Code.

8. Reasons

i) The additional rescue equipment and door to be installed will provide an increase in the level of safety for the pool. The additional door will allow access to the outdoor portion of the pool in summer months, promoting a faster response time if difficulties should arise in the outdoor area.

ii) The swimming pool is relatively small, having a limited path of travel around the perimeter. In addition, the swim-through water channel is fairly shallow and narrow enough that rescue efforts from the deck on either side would not be significantly hampered.

iii) The interior bridge itself is a hazard. Children play underneath the bridge where they are not visible. In addition, diving off the bridge and railing has been known to occur.

iv) The bridge also prevents access to an area in the corner of the passageway between the interior and exterior that is inaccessible from the pool deck.

v) The exterior bridge is not viewed to be a substantial hazard and will continue to provide a means to cross the channel during times of operation of the outdoor pool area.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Article 9.10.19.3. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Fernando Fabiani, President, Fabiani Architect Ltd., for the resolution of a dispute with Frank Asta, Chief Building Official, Town of Oakville, to determine whether the proposed fire access route, when considering the addition of a firewall between units within a residential townhouse block, creating "buildings" having an area of less than 600 m^2, complies with the access route requirements of Article 9.10.19.3. of the Ontario Building Code at the Marine Cove Condominiums, Oakville, Ontario.

APPLICANT	Fernando Fabiani, President Fabiani Architect Ltd. Burlington, Ontario
RESPONDENT	Frank Asta Chief Building Official Town of Oakville
PANEL	Len King, Vice-Chair John Guthrie Gary Burtch
PLACE	Toronto, Ontario
DATE OF HEARING	January 17, 2002
DATE OF RULING	January 17, 2002
APPEARANCES	Fernando Fabiani, President Fabiani Architect Ltd. Burlington, Ontario **The Applicant** Gary LaFramboise Fire Prevention Officer Town of Oakville **Designate for the Respondent**

RULING

1. The Applicant

Fernando Fabiani, President, Fabiani Architect Ltd., has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is proposing the construction of a townhouse complex at the Marine Cove Condominiums, Oakville, Ontario.

2. Description of Construction

The Applicant is proposing the construction of a residential development which includes two blocks of townhouses consisting of 14 dwelling units. It is proposed that each block of townhouses will be subdivided by a fire wall to, in effect, create four separate "buildings". Each block would then consist of two "buildings" having building areas of 179 m^2 and 444 m^2. All four buildings would be two stories in building height with an optional loft for some of the units. The structures will be comprised of combustible construction.

The nature of the dispute involves the location of the fire truck access route in relation to the front entrances of the dwelling units in the two townhouse blocks. Furthermore, the adequacy of the size and configuration of the proposed fire route itself is in question. In this respect, the two proposed blocks of townhouses are situated perpendicular to the proposed fire access route which ends at a turning circle near the middle of the two structures. The distance measured from the edge of the turning circle to the entrance of the furthest unit in the western block of townhouses is approximately 28.4 m. Similarly, the measurement from the access route to the farthest easterly dwelling entrance is approximately 38.6 m. The access route itself measures 6 m from curb to curb and dead-ends at a cul-de-sac turning circle having a radius of approximately 12.75 m. Situated at the centre of this turning circle are 6 parking spaces, dedicated for use by visitors of the development.

At issue in this regard is whether the distances measured from the fire access route to the most remote of the dwelling units are permitted by the Code when considering the size of the buildings being constructed and whether the proposed fire route is adequate to serve the purpose for which it is designed.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed fire access route, when considering the addition of firewalls to create buildings having an area of less than 600 m^2, provides sufficiency of compliance with the requirements of 9.10.19.3. of the Ontario Building Code (OBC).

Article 9.10.19.3. outlines the fire access route requirements for building governed by Part 9 of the Code. Sentence (1) provides that access for fire department equipment must be provided to each building by way of a street or private roadway. Sentence (2) details that the design of this access route shall take into account connection with public thoroughfares, weight of fire fighting equipment, width of roadway, radius of curves, location of hydrants, etc.

As noted above, the townhouse blocks in question are divided by firewalls to effectively create "buildings" having a building area of less than the 600 m^2 criterion that would mark the cut off for

consideration under Part 9 of the Code. The Applicants argue that, in providing a roadway into the residential development designed for use as a fire access route, they have complied with the requirements of Article 9.10.19.3., despite the fact that the farthest unit is approximately 38.6 m from the turning circle, as no restrictions on travel distance are included in this Code provision.

4. Provisions of the Ontario Building Code

9.10.19.3. Fire Department Access to Buildings

(1) Access for fire department equipment shall be provided to each *building* by means of a *street*, private roadway or yard (See A-3.2.5.6.(1) and A-9.10.19.3.(1) in Appendix A.)

(2) Where access to a *building* as required in Sentence is provided by means of a roadway or yard, the design and location of such roadway or yard shall take into account connection with public thoroughfares, weight of fire fighting equipment, width of roadway, radius of curves, overhead clearance, location of fire hydrants, location of fire department connections and vehicular parking.

5. Applicant's Position

The Applicant's Agent advised that he has been involved in this project since the early rezoning stages of development. At that time, a site plan had been submitted in connection with the proposal outlining the desired access route configuration. He was advised by municipal staff that this would be acceptable to the City on condition that fire walls were added between certain units to create smaller buildings, bringing the development under Part 9 of the OBC. Based on those assurances, his client proceeded to purchase the property and file the appropriate development applications.

The Agent continued by advising that when the formal application for site plan approval was submitted to the City, the fire department comments differed from those initially received in connection with this proposed development. The Applicants were now being advised that they would have to sprinkler the building because the proposed fire department access route did not meet Code requirements. At that time, the Agent submitted, he undertook a more detailed analysis of the Code and determined that the Part 9 requirements were fairly vague and not at all prescriptive in nature. As a result, being that the buildings that were created by way of the addition of firewalls between units were of a size that would be governed by Part 9, and in the provision of a roadway designed for use as a fire access route, it was his belief that the proposal provided sufficiency of compliance with the OBC in this regard.

In summation, the Agent further argued that the City's consideration of the more prescriptive requirements outlined in Part 3 of the Code were not warranted. He submitted that building size is the basis of interpretation of which provisions of the Code should apply. Admittedly, Part 3 would be applicable if not for the firewalls creating smaller buildings as defined by the Code. He acknowledged the fire department's concern for an access route that could function to serve the purpose for which it was designed, however in his opinion, the proposed fire route access to the development meets the intent of the Part 9 provisions of the OBC.

6. Respondent's Position

The Designate for the Respondent advised the Commission that it is unusual for a fire access route to be designed as proposed by the Applicant. Typically, where a 15 m travel distance from the access route to the entrance of a building cannot be met, sprinklering is provided by the Applicant. In respect to the proposed development, the Designate argued that, there is usually no problem associated with a 6 m wide access route where the street runs parallel to the rows of houses. However, in this instance, since the access route is designed so that it runs perpendicular to the blocks of houses, it provides limited access to emergency vehicles and fire fighters. The size and configuration of the access route and the turning circle will create a bottleneck for fire department vehicles. This will result in an unacceptable increase in response time. In particular, he was concerned that the City's ariel and Tower 1 trucks would not be able to manoeuver through the fire access route. These trucks measure 100 ft and 75 ft long respectively.

He advised the Commission that the fire department had undertaken an analysis of response times and manoeuverability for this type of access route design. He submitted that during normal operations in response to an emergency call, the fire department would have difficulty operating within the design proposed by the Applicant. A larger turning circle may be of assistance in this respect, however, once the initial response vehicles come to the end of the cul-de-sac, it still prevents the free flow of movement for other approaching vehicles. This fact, combined with the travel distance to the farthest units, creates a concern for the fire department in being able to adequately respond to a fire situation.

The Designate emphasized that the focus of his concern was on the life safety of the occupants of the proposed units. When considering all factors associated with this development, including that the garages of the units are situated to the rear of the structures, he was troubled by the fact that the fire department may not be able to adequately fight a fire in these building. The Designate submitted that, in this opinion, the proposed access route should have been designed to comply with the prescriptive Code requirements of Articles 3.2.5.4. and 3.2.5.5. He suggested that, failing this, the buildings should be sprinklered to provide the additional time required for the fire department to adequately respond.

In summation, the Designate submitted that, even if this development is considered under Part 9 of the Code, consultation with the fire department in the design of a fire access route is required. In this regard, they are not satisfied that the present design would meet their needs in respect to their ability to achieve an acceptable standard of fire fighting. In his opinion, the more prescription requirements of Part 3 of the Code should be applied, particularly with respect to the travel distance between the access route and the dwelling unit entrances.

7. Commission Ruling

It is the decision of the Building Code Commission that the addition of firewalls between certain units within the residential townhouse blocks to create buildings having an area of less than 600 m^2 brings the design within the scope of Part 9 of the Ontario Building Code. As a result, the buildings are required to comply with Article 9.10.19.3. of the OBC, which will ensure fire department access.

It is also the decision of the Building Code Commission that the proposed fire fighting access complies with the intent of Article 9.10.19.3. of the OBC at the Marine Cove Condominiums, Oakville, Ontario.

8. Reasons

i) With the construction of the proposed firewalls, all buildings on the site will be less than 600 m^2 in building area and a maximum of three storeys in building height. As buildings with building

areas of less than 600 m^2, Part 9 and Article 9.10.19.3. specifically are the relevant construction standards governing this dispute.

ii) OBC 9.10.19.3. states that "(a)ccess for fire department equipment shall be provided to each *building*...". Such fire route access need not follow the prescriptive requirements set out in Part 3 of the OBC, however, it must still be located and designed so as to be practical and functional when considering the fire fighting equipment of the local municipality. It is for this reason that this Article refers to the OBC Appendices, which in turn suggest that the designer consult with the local fire department. It is also good practice to refer to Part 3, specifically Articles 3.2.5.5. and 3.2.5.6., for guidance in the design.

iii) Article 3.2.5.5. begins by referencing Sentence 3.2.5.4.(1). This Sentence, however, which deals with access routes for fire department vehicles, is intended only for large buildings as it makes clear that it applies just to buildings exceeding three storeys in height and larger than 600 m^2 and not simply to Part 3 buildings as a whole. (Indeed, a building can be 600 m^2 and less and/or three storeys and less and still be considered Part 3 construction due to its occupancy classification. However, such a building would not be subject to the access route provisions of Sentence (1) of Article 3.2.5.5.) As a result, compliance with the prescriptive access route requirements of Sentence 3.2.5.5.(1), as suggested by the Respondent, is not reasonable for the subject buildings, especially since they are Part 9 construction.

iv) Despite the fact that the prescribed requirements of Part 3 need not be adhered to, the proposed design is substantially in compliance with Articles 3.2.5.5. and 3.2.5.6. with the exception of Sentence (1) of Article 3.2.5.5. This Sentence deals with the distance required between the access route and the principal entrance and access openings of a building which permits a maximum distance of 15 m (49 ft 3 in). The farthest distance in this instance between the access route and a principal entrance is 38.6 m (126 ft 7 in).

APPLICANT	Harold Prell Homeowner, Kitchener, Ontario
RESPONDENT	Jim Witmer Chief Building Official City of Kitchener
PANEL	Michael Steele, Chair - Designate Donald Pratt Gary Burtch
PLACE	Toronto, Ontario
DATE OF HEARING	December 13, 2001
DATE OF RULING	December 13, 2001
APPEARANCES	Harold Prell Homeowner, Kitchener, Ontario **The Applicant** Glen Good Deputy Chief Building Official City of Kitchener **Designate for the Respondent**

RULING

1. The Applicant

Harold Prell, Homeowner, Kitchener, Ontario, has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and has constructed an addition to his single detached dwelling at 49 Bingeman Street, Kitchener, Ontario.

2. Description of Construction

The Applicant has recently undertaken renovations to his Class C, residential dwelling. As well, an addition to the dwelling is currently being constructed. The building has an area of less than 600 m^2 with a building height of two storeys.

The construction in dispute involves the design of the guards proposed to be used at several locations throughout the interior and exterior of the dwelling. The guards are comprised of hand crafted wrought iron members with a stainless steel handrail. All pieces will be assembled on site and welded together. There are three guard designs proposed for various aspects of the building.

The first design, proposed for use on the interior stair and landing areas, is partially comprised of curving metal members designed in an ornamental floral pattern. The vertical pickets of the guard are interwoven with this floral pattern and other ornate decorative attachments that protrude into the area between the balusters.

The second guard design, proposed to serve the two exterior rectangular balconies, incorporates a scroll-like fixture at the mid point of each picket. This decorative feature projects approximately 40 mm (1.5 in) out from the vertical picket.

The third guard in dispute will serve the semi-circular exterior balconies. The subject balusters of this guard design, when viewed in cross section, are not vertical. They are designed with an outward projecting curvature, i.e., in a bow shape. The lower portion of the balusters curves away from the exposing face of the building. The slope of this portion is measured at approximately 45° to 55° from horizontal at approximately 100 to 150 mm above the walking surface. This balustrade also incorporates a number of ornate decorative protrusions that join the pickets in various locations.

For all three of the guard designs the Applicant has undertaken to ensure that the loading requirements of the Code are met and that there will be no openings greater than 100 mm.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed guards which include ornate decorative elements in the area between 100 mm and 900 mm above the walking surface provide sufficiency of compliance with Article 9.8.8.5. of the Ontario Building Code.

This provision stipulates that required guards must be designed in such a way so as not to facilitate climbing between 100 and 900 mm above the floor or walking surface of the area the guard is protecting. The issue at dispute is whether the various designs of the proposed guards will facilitate climbing.

4. Provisions of the Ontario Building Code

9.8.8.5. Design to Prevent Climbing
(See Appendix A.)

(1) *Guards* required by Article 9.8.8.1. and serving *buildings* of *residential occupancy* shall be designed so that no member, attachment or opening located between 100 mm (4 in) and 900 mm (2 ft 11 in) above the floor or walking surface protected by the *guard* will facilitate climbing.

5. Applicant's Position

The Applicant advised that he is currently renovating a 100 year old home and has also constructed an addition to the building. Without realizing that this would be an issue, the Applicant imported the components of the guard to be assembled on site. The renovations are nearing completion and, after discussions with the municipality, the proposed guard design became an issue. He advised that this has been a frustrating process for both himself and his architect who advised that similar ornate designs had been approved elsewhere throughout the province.

At the hearing the Applicant undertook to ensure that all aspects of the Code in respect to structural loading and size of openings would be complied with. The only dispute, he submitted, was with respect to the subjective issue of climbability. In respect to the interior and exterior vertical guards, the Applicant acknowledged that the design was very ornate but suggested that there was no ladder effect being created. He argued that the appearance of the guard does not invite climbing and that the features are merely decorative.

In respect to the outward curving balusters the Applicant made the argument that this bow-like effect made the guard more difficult to climb. He stated that, to gain a toe hold on the balusters, one would have to be leaning backward, away from the top of the handrail. This would not facilitate climbing. In addition he advised that the exterior balconies in question were quite small and that doors to these areas would generally be locked.

In summation, the Applicant submitted that it remained questionable whether a child would, or could, climb the guards. He suggested that, because many of the decorative elements have sharp edges, a potentially painful hand or foot hold would help to deter climbing. He advised that he had spent a considerable amount of time on the renovation of this building and in trying to incorporate a guard design that would conform to the general character of the neighbourhood.

6. Respondent's Position

The Designate for the Respondent submitted that the municipality is regularly presented with ornamental and decorative guards for consideration. He recognized the investment that the Applicant has made and acknowledged the unique design being proposed. The Designate agreed that the designs do not look like a ladder but argued that, as a result of the decorative features throughout the guard, a toe hold could be obtained.

The Designate recognized that the guards were not situated in a public space and advised that he was more concerned with the interior guard than the ones serving the small exterior balconies. He conceded

that the balcony areas were quite small with restricted access and that people would not tend to congregate there. However the interior guard, he argued, would be a focal point within the home. Guests may have children who could be enticed by the design to attempt to climb the guard.
In summation the Designate advised that the Code does not provide much latitude in guard design. In this instance, despite the increased level of supervision one might expect in a private residence, he could not accept the guard designs as proposed since, in his opinion, the they do not comply with the Code.

7. Commission Ruling

It is the decision of the Building Code Commission that:

i) The ornamental wrought iron guard with balusters having an outward curve creating a slope on the lower portion of the picket provide sufficiency of compliance with Article 9.8.8.5. of the OBC, and

ii) The guards designed with vertical balusters containing decorative wrought iron elements within the safety zone between 100 mm and 900 mm above the walking surface provide sufficiency of compliance with the OBC on condition that they are modified to prevent climbing as follows:

   a) The guard is to be protected on the interior surface by the installation of an additional covering, approved by the municipality, which prevents climbing.
   b) The additional material is to be affixed in a manner which prevents removal except through the use of tools to, for example, facilitate cleaning or repair.

8. Reasons

i) The curvature of the balusters is directed outward from the balcony and from the upper rail of the guard, making climbing difficult.

ii) The additional protective covering on the interior surface of the vertical guards will satisfy the provisions of the Building Code, whereas, the design of the vertical pickets with ornamental features and attachments within and throughout the safety zone could otherwise be considered to facilitate climbing.

Dated at Toronto this **13th** day in the month of **December** in the year **2001** for application number **2001-73.**

Ruling No. 01-59-852
Application No. 2001-71

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentences 3.2.2.4.(2), 3.2.2.5.(1), 3.2.2.6.(1), Article 3.2.2.24. and Sentence 11.2.1.2.(1) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Jeffrey W. Glendinning, Glendinning Funeral Home, for the resolution of a dispute with Jim Watson, Chief Building Official, Township of Blandford-Blenheim, to determine whether the proposed 56.6 m^2 addition to an existing multiple occupancy (A2 and C) building, which is intended to be unsprinklered and constructed using combustible construction, provides sufficiency of compliance with Sentences 3.2.2.4.(2), 3.2.2.5.(1), 3.2.2.6.(1), Article 3.2.2.24. and Sentence 11.2.1.2.(1) of the Ontario Building Code at the Glendinning Funeral Home, 40 William Street, Plattsville, Ontario.

APPLICANT	Jeffrey W. Glendinning Glendinning Funeral Home Plattsville, Ontario
RESPONDENT	Jim Watson Chief Building Official Township of Blandford-Blenheim
PANEL	Kenneth Peaker, Chair Robert De Berardis Fred Barkhouse
PLACE	Toronto, Ontario
DATE OF HEARING	December 6, 2001
DATE OF RULING	December 6, 2001
APPEARANCES	Tim Schaner Tim A. Schaner Project Management Design-Management Waterloo, Ontario **Agent for the Applicant** Jim Watson Chief Building Official Town of Blandford-Blenheim **The Respondent**

RULING

1. The Applicant

Jeffrey W. Glendinning, Glendinning Funeral Home, Plattsville, Ontario, has applied for a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is proposing to construct an addition to the Glendinning Funeral Home, 40 William Street, Plattsville, Ontario.

2. Description of Construction

The Applicant is proposing to construct a 56.6 m^2 addition to an existing multiple occupancy building. The existing structure has a building area of 667.7 m^2 and accommodates both Group A, Division 2 and Group C major occupancies. The existing building is comprised of combustible construction and is not equipped with either a fire alarm system or a sprinkler system.

The purpose of the proposed addition is to enlarge the lobby area of the existing funeral home. This portion of the building has an A2 occupancy classification and is one storey in building height. The structure also encompass a one storey, Group C dwelling, directly to the north of the funeral home portion as well as a seven unit, three storey, Group C apartment building occupying the southwest portion of the structure. The proposed lobby addition is solely attached to the one storey section of the building along the east side and does not come into contact with the three storey apartment. While a masonry block wall separates the three storey portion from the remainder of the building, this is not considered to be a fire wall and, as such, the entire structure is considered to have a building height of three storeys.

The construction in dispute involves the one storey addition to the funeral home lobby which is to be constructed using combustible construction and, without a sprinkler system. The proposal for this addition calls for the use of wood frame construction and fire rated drywall. In addition, while the Applicant's preference is to avoid sprinklering this small area entirely, he would concede to sprinklering the addition using the existing domestic water supply as well as provide interconnected smoke alarms to compensate for the use of combustible material in the construction.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed unsprinklered addition comprised of combustible construction provides sufficiency of compliance with Sentences 11.2.1.2.(1), 3.2.2.4.(2), 3.2.2.5.(1) and 3.2.2.6.(1) and Article 3.2.2.24. of the Ontario Building Code (OBC).

Sentence 11.2.1.2.(1) of the Code, concerning renovations to buildings with multiple major occupancies, directs readers to Articles 3.2.2.5. to 3.2.2.8. Furthermore, Sentence 3.2.2.4.(2) provides that, where a building contains more than one major occupancy, the Code provisions concerning building size and construction relative to occupancy will apply according to Articles 3.2.2.5. to 3.2.2.8.

Particular to this dispute, Sentence 3.2.2.5.(1) requires that, in determining fire safety requirements in relation of each major occupancy, building height and area shall be used. In addition, Sentence 3.2.2.6.(1) provides, with an exception not applicable here, that for a building containing more than one major occupancy, the requirements for the more restricted major occupancy shall apply to the whole building.

In respect to the subject proposal, when considering building height, area and the most restricted major occupancy, the relevant requirements for the structure are outlined in Article 3.2.2.24. These requirements apply to the Group A, Division 2 occupancy. Article 3.2.2.24. would require that the subject addition be sprinklered and be constructed using noncombustible materials. Floor assemblies are to be fire separations having a resistance rating of not less than one hour and all loadbearing walls, columns and arches shall provide a fire-resistance rating not less than what is required for the supported assembly.

In respect to the proposed construction as noted above, the addition to the funeral home lobby is intended to be comprised of combustible construction and, as originally proposed, will not be equipped with a sprinkler system. In the alternative, sprinklering with use of the existing domestic water supply has been offered as well as a system of interconnected smoke detectors intended to compensate for the use of combustible construction material.

4. Provisions of the Ontario Building Code

3.2.2.4. Buildings with Multiple Major Occupancies

(1) The requirements restricting fire spread and collapse for a *building* of a single *major occupancy* classification are provided in this Subsection according to its *building height* and *building area*.

(2) If a *building* contains more than one *major occupancy*, classified in more than one Group or Division, the requirements of this Subsection concerning *building* size and construction relative to *major occupancy* shall apply according to Articles 3.2.2.5. to 3.2.2.8.

3.2.2.5. Applicable Building Height and Area

(1) In determining the fire safety requirements of a *building* in relation to each of the *major occupancies* contained therein, the *building height* and *building area* of the entire *building* shall be used.

3.2.2.6. Multiple Major Occupancies

(1) Except as permitted by Articles 3.2.2.7. and 3.2.2.8., in a *building* containing more than one *major occupancy*, the requirements of this Subsection for the most restricted *major occupancy* contained shall apply to the whole *building*.

11.2.1.2. Multiple Occupancies

(1) The classification of an existing *building* of multiple *occupancy* under Article 11.2.1.1. shall be applied according to Articles 3.2.2.5. to 3.2.2.8.

3.2.2.24. Group A, Division 2, up to 6 Storeys, Any Area, Sprinklered

(1) A *building* classified as Group A, Division 2, that is not limited by *building area*, is permitted to conform to Sentence (2) provided

(a) except as permitted by Sentence 3.2.2.7.(1), *the building* is *sprinklered*, and

(b) it is not more than 6 *storeys* in *building height*.

(2) Except as permitted by Article 3.2.2.16., the *building* referred to in Sentence (1) shall be of *noncombustible construction*, and

(a) floor assemblies shall be *fire separations* with a *fire-resistance rating* not less than 1 h,
(b) *mezzanines* shall have a *fire-resistance rating* not less than 1 h, and
(c) all *loadbearing* walls, columns and arches shall have a *fire-resistance rating* not less than that required for the supported assembly.

5. Applicant's Position

The Applicant's Agent advised that they are looking to construct a small addition to the vestibule/lobby area of the existing funeral home portion of the building. It is proposed that the addition would be of similar construction to the existing building, consisting of wood frame construction and fire rated dry wall. Although it is the Applicant's preference not to sprinkler this relatively small area, they offered to sprinkler the addition using the existing domestic water supply and suggested that engineered drawings could be provided for an appropriate system.

The Agent emphasized that their prime concern was with respect to the requirement for the use of noncombustible construction material. In this regard, to allow for continuity in the appearance between the addition and the existing the building it would be preferable to build using similar construction materials as the remainder of the structure. This would be the most cost effective and aesthetic option, particularly in light of the relatively small size of the addition.

The Agent emphasized that, although the funeral home is connected to the three storey residential portion of the building, the addition itself is not. The construction would be located adjacent to the single storey residential building at the front entrance of the one storey funeral home which would stand between the new construction and the seven unit apartment. To compensate for the use of combustible construction in the addition, the Agent submitted that the Applicant is willing to install a system of interconnected smoke alarms throughout the building. This would provided for an increased level of safety for the occupants of the Group C portions of the building.

In summation, the Agent recognized the OBC requirements for buildings up to six storeys in height containing a Group A, Division 2 occupancy, but suggested that in light of the relatively small size of the addition and considering the composition of the rest of the building, there would be little or no benefit to require strict compliance with these provisions in this instance. In addition, he reiterated the Applicant's willingness to provide sprinklering from the domestic water supply and to furnish the building with interconnected smoke detectors, although not required by the Code.

6. Respondent's Position

The Respondent submitted that it was his position that the proposed addition did not comply with the provisions outlined in the Code. In this regard he advised that noncombustible construction and a sprinkler system would be required. He was unable to accept the Applicant's proposal for the use of combustible construction and, in respect to any proposed sprinkler system from the existing domestic water supply, he stated that engineered stamped drawings would be required to ensure compliance with Code standards. He emphasized, however, that sprinklering would only be required in the area of the new addition.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed 56.6 m^2 addition to an existing,

multiple occupancy (A2 and C) building which is intended to be unsprinklered and constructed using combustible construction does not provide sufficiency of compliance with Sentences 3.2.2.4.(2), 3.2.2.5.(1), 3.2.2.6.(1), Article 3.2.2.24. and Sentence 11.2.1.2.(1) of the Ontario Building Code at the Glendinning Funeral Home, 40 William Street, Plattsville, Ontario.

8. Reasons

i) The new addition is required to comply with the construction requirements of Article 3.2.2.24. of the Ontario Building Code.

ii) The compensating measures offered in lieu of compliance are inadequate to achieve sufficiency of compliance with the requirements of the Code.

AND IN THE MATTER OF Article 3.3.5.6.of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Larry McDonald, Director, Ira McDonald Construction Ltd. for the resolution of a dispute with Agris Robeznieks, Chief Building Official, City of Mississauga, to determine whether the "trucking area" (used for loading/unloading) in an industrial building is considered as a "storage garage" and therefore required to be separated from the adjacent warehouse area by a fire separation having a fire-resistance rating of 1.5 hours in accoradance with Article 3.3.5.6. of the Ontario Building Code at Ontario Flower Growers, 910 Midway Boulevard, Mississauga, Ontario.

APPLICANT	Larry McDonald, Director Ira McDonald Construction Ltd.
RESPONDENT	Agris Robeznieks Chief Building Official City of Mississauga
PANEL	Kenneth Peaker, Chair Donald Pratt Gary Burtch
PLACE	Toronto, Ontario
DATE OF HEARING	November 8th, 2001
DATE OF RULING	November 8th, 2001
APPEARANCES	Stephen Parazder, President S.P. Design Inc. **Agent for the Applicant** Frank Spagnolo Manager, Building Engineering & Inspections City of Mississauga **Designate for the Respondent**

RULING

1. The Applicant

Mr. Larry McDonald, Director, Ira McDonald Construction Ltd., has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended and is constructing an addition to a warehouse facility known as Ontario Flower Growers, 910 Midway Boulevard, Mississauga, Ontario.

2. Description of Construction

The Applicant is constructing a one storey addition to an existing one storey warehouse facility. The building is classified as a Group F, Division 3 major occupancy and, with the completion of the 8,362 m^2 addition, will have a total building area of 14,514 m^2. Both the existing building and proposed addition are comprised of noncombustible construction and are equipped with fire alarm and sprinkler systems.

The addition itself is divided into two equal halves. The western half is designed as a truck loading area and the eastern portion of the addition is designated for warehouse purposes. A north-south running, 203 mm (8 in), thick concrete block partition separates these two areas. The ceiling height within the building is approximately 9.1 m. The masonry partition will be less than this height, i.e., it will extend not extend to the underside of the ceiling. In addition, non-rated swing doors and overhead doors are proposed to provide access through the partition for the purposes of transferring products between the truck loading area and the warehouse portion of the building.

The construction in dispute involves design of the partition which divides the two areas of the addition. Specifically, the determination of whether the truck loading area is considered as a "storage garage" for the purposes of the application of the Building Code will affect its design. As noted, the concrete block wall that will divide the trucking area and warehouse portion of the structure does not extend to full ceiling height and is penetrated by swing and overhead doors. This wall would not provide a fire separation with a resistance rating of 1.5 hours that would be required if the trucking area were considered as a storage garage.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the "trucking area" is considered a "storage garage" and is therefore required to be separated from the adjacent warehouse area by a fire separation having a fire-resistance rating of 1.5 hours in accordance with Article 3.3.5.6. of the Ontario Building Code (OBC).

Article 3.3.5.6. of the Code outlines the separation requirements for a "storage garage" and mandates that, such an area be separated from other occupancies by a fire separation having a resistance rating of not less than 1.5 hours. It should be noted that "storage garage" is defined in the Building Code as "a *building* or part thereof intended for the storage or parking of motor vehicles and which contains no provision for the repair or servicing of such vehicles."

The Respondent is advancing the position that the truck loading area is, in fact a storage garage, and therefore subject to the provisions outlined in Article 3.3.5.6. The Applicant disagrees with this assertion and, as noted above, the partition separating the two areas of the new addition is not designed to provide for a fire-resistance rating of 1.5 hours.

4. Provisions of the Ontario Building Code

3.3.5.6. Storage Garage Separation

(1) Except as permitted by Sentences 3.3.4.2.(4) and (5), a *storage garage* shall be separated from other *occupancies* by a *fire separation* with a *fire-resistance rating* not less than 1.5 h.
Articles 3.1.8.7. and 3.1.8.8.

5. Applicant's Position

The Applicant's Agent advised that the building operation involves the transport of plants and flowers that are susceptible to extreme whether conditions. As a result, the loading and unloading of product would ideally occur within the building to prevent damage during the winter months. He ensured the Commission that the Applicant acknowledges the importance of fire and life safety features. He submitted that the building is comprised of noncombustible construction, it faces three streets, has vehicular access on all four sides and is within 90 metres of 9 fire hydrants.

The Agent stated that it was his interpretation that the passageway through the truck loading area was not a "storage garage" as defined by the Building Code. It is merely an area for trucks to drive into for the purpose of loading and unloading. He suggested that there are many such buildings being constructed, particularly for use by the steel industry . He further maintained that it would be almost impossible to fire separate the two areas given the nature and function of the building.

The Agent advised that it was also important to note that the existing building, built in 1985, incorporated similar trucking areas. There were no fire separations between those areas and adjacent uses. These portions of the original structure have since been converted to cooling areas for cut flowers and potted pants. In his opinion, the new addition has the same use and function as the previously approved structure. He further argued that the entire building is classified as an F3 occupancy. As a result, the warehouse and truck loading areas are not required to be fire separated.

In support of his position and the proposed partition design, the Agent advised the that there would be staff present to monitor the area. He stated that there is no extended parking inside the facility. Trucks simply line up, a load is transferred, and the vehicles drive out. He suggested that the masonry wall that currently divides the areas is primarily for the control of carbon monoxide and to address security concerns. The doors are not proposed to be fire rated and there is some question, from a structural standpoint, about whether the wall under construction can be safely extended to the height of the building. In addition he stated that, for the purpose of this operation, it is not functional to have the doors close after each use. This would significantly impede the flow of product between the two areas.

In summation, to alleviate any concerns, the Agent offered to post signs within the area to prevent extended parking and to double the number of available fire extinguishers. He reiterated that this is a fully sprinklered building and maintained that a fire separation in this area is not required. His position remained that this was not a storage garage. It was, he argued, a monitored area used for the transference of product. He submitted that there are many such buildings throughout the province which have not been required to fire separate the subject areas.

6. Respondent's Position

The Designate for the Respondent submitted that, while the portion of the building in question may be termed a loading and unloading area, it is also considered a storage garage for the purposes of applying the Building Code. Although the occupancy classification is the same throughout the building, the OBC requires a fire separation of other building areas from a storage garage. Therefore, he submitted, a 1.5 hour fire resistance rating is required between the trucking area and the remainder of the building.

The Designate advised that, from the time he has held his present position, this requirement has been consistently enforced in the City of Mississauga, even in steel operations. He emphasized that there is no control over how long a vehicle may remain in the truck loading area. It maybe 5 minutes or possibly 2 hours or more. In fact, he argued, there is the potential for parking inside the structure for extended periods of time.

He stated that, while he understands that a fire separation may hinder the flow of material between the warehouse and the truck loading area, he emphasized that safety is his main concern. He maintained that his position in the application of Code is that this area is considered as a storage garage and must meet the requirements set out in Article 3.3.5.6.

7. Commission Ruling

It is the decision of the Building Code Commission that the "trucking area" (used for loading/ unloading) in the subject industrial building is a "storage garage" and therefore required to be separated from the adjacent warehouse area by a fire separation having a fire-resistance rating of 1.5 hours in accordance with Article 3.3.5.6. of the Ontario Building Code at Ontario Flower Growers, 910 Midway Boulevard, Mississauga, Ontario.

8. Reasons

i) Trucks will be temporarily parked inside the building within the trucking area for the loading and unloading of material. Regardless of the length of time the vehicles remain parked, the function is still one of a storage garage as defined by the Ontario Building Code. A 1.5 hour fire separation is therefore required.

ii) While the major occupancy classification for the entire building is F3, the requirement to separate a storage garage from the adjacent occupancies remains. The function of the adjacent area is different and the prescribed level of construction is appropriate for the protection of the warehouse facility and its occupants.

Ruling No. 01-56-849
Application No. 2001-68

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 9.8.8.5.(1) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Pierre and Jacky Doyon, property owners, for the resolution of a dispute with Edward Link, Chief Building Official, City of Windsor, to determine whether the as-installed guard on an exterior deck having a horizontal member located at 165 mm above the walking surface, provides sufficiency of compliance with Sentence 9.8.8.5.(1) of the Ontario Building Code at 2429 Trappers Avenue, Windsor, Ontario.

APPLICANT	Pierre and Jacky Doyon, property owners 2429 Trappers Avenue Windsor, Ontario
RESPONDENT	Edward Link Chief Building Official City of Windsor
PANEL	Kenneth Peaker, Chair Donald Pratt Gary Burtch
PLACE	Toronto, Ontario
DATE OF HEARING	November 8th, 2001
DATE OF RULING	November 8th, 2001
APPEARANCES	Pierre Doyon, property owner **The Applicant** Eddie Stout Building Inspector City of Windsor **Designate for the Respondent**

RULING

1. The Applicant

Pierre and Jacky Doyon, property owners, have received an Order to Comply under the *Building Code Act*, S.O. 1992, c. 23, as amended to remedy certain alleged deficiencies with respect to the guard on a newly constructed rear yard deck at 2429 Trappers Avenue, Windsor, Ontario.

2. Description of Construction

The Applicants are the owners of a Class C, residential dwelling having a building area of 132.4 m^2. In the Spring of 2001 they applied for and were given approval to construct a deck at the rear of the subject building. The newly constructed deck measures 3 m x 3.66 m (10 ft x 12 ft) and is comprised of pressure treated lumber set into concrete footings.

The guard serving the deck has been constructed to a height of 914 mm (36 in) and is capped with a 2 x 4 handrail supported in a "T" shaped configuration by a 2 x 6. This handrail and the lower horizontal member running across the bottom of the guard are connected by a series of vertical wooden balusters. The construction in dispute specifically relates to the height of this bottom horizontal member which is situated 165 mm (6.5 inches) above the walking surface.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the deck guard, having a horizontal member located at 165 mm above the walking surface, provides sufficiency of compliance with Sentence 9.8.8.5.(1) of the Ontario Building Code.

This provision stipulates that required guards must be designed in such a way so as not to facilitate climbing between 100 mm and 900 mm above the floor or walking surface of the area the guard is protecting. As noted above, the newly constructed deck has a bottom horizontal rail, the top of which is 165 mm above the deck surface.

4. Provisions of the Ontario Building Code

9.8.8.5. Design to Prevent Climbing
(See Appendix A.)

(1) *Guards* required by Article 9.8.8.1. and serving *buildings* of *residential occupancy* shall be designed so that no member, attachment or opening located between 100 mm (4 in) and 900 mm (2 ft 11 in) above the floor or walking surface protected by the *guard* will facilitate climbing.

5. Applicant's Position

The Applicant outlined the process undertaken in obtaining a building permit from the municipality. At the time of their application they were advised by municipal staff that only a site plan outlining the location of the deck was required. In addition to the site plan the Applicant's also offered drawings that outlined the specifications of construction for the deck. They were advised that these drawings were unnecessary and a permit was issued.

They then proceeded with the construction based on their original plans and the permit that was issued. After construction was complete, the deck was inspected and they were advised of the compliance issue. The Applicant submitted that the slight variation from the Code requirement was not a safety concern and, in any event, if the municipality had been more diligent in the initial stages, this problem would never have occurred. He stated that he was not advised of the construction parameters for a deck or guard when he filed his application. He asserted that he should not have to amend the situation after receiving little or no direction for the City in this regard.

6. Respondent's Position

The Designate for the Respondent confirmed the Applicant's account of the permit application process. He advised that, after construction had commenced, the footings for the deck were inspected and the owners given approval to continue. He stated that the Applicants were told to contact the City if they had any questions in this regard. The Designate stated that the responsibility to find out what Building Code requirements are involved in any construction lies with the homeowner. If they were uncertain, staff could have provided them advice.

The Designate submitted that the primary issue in this instance he submitted is with respect to climbability. He has no difficulty in regard to the openings or structural integrity, however, the horizontal member located 165 mm from the walking surface fails to meet the intent of the Code. He suggested that to achieve compliance the Applicant could either lower the bottom rail or, alternatively, add to the top railing to create the same 800 mm zone of safety where climbing would not be facilitated. Either alternative would be acceptable to the City, he indicated.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-installed guard on an exterior deck having a horizontal member located 165 mm above the walking surface does not provide sufficiency of compliance with Sentence 9.8.8.5.(1) of the Ontario Building Code at 2429 Trappers Avenue, Windsor, Ontario

8. Reasons

i) The as-installed guard does not meet the intent of the Building Code to provide a zone of safety where climbing would not be facilitated. The horizontal rail located 165 mm clearly exceeds the Code requirement that no member be located between 100 mm and 900 mm above the walking surface.

ii) Sufficiency of compliance with respect to the issue of climbability has not been achieved in this instance. No compensating measures were offered.

Dated at Toronto this **8th** day in the month of **November** in the year **2001** for application number **2001-68**.

Ruling No. 01-55-848
Application # 2001-58

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 3.4.6.7.(1) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Harry Ziegler, Chief Engineer, Technical Coatings Co. Ltd., for the resolution of a dispute with Dan Mousseau, Chief Building Official, City of Burlington, to determine whether the as-constructed stairs that provide access to a mezzanine level in an industrial occupancy and having a minimum run of 229 mm (9 in), provide sufficiency of compliance with Sentence 3.4.6.7.(1) of the Ontario Building Code at Technical Coatings Co. Limited, 1164 Walkers Line, Burlington, Ontario.

APPLICANT	Harry Ziegler, Chief Engineer Technical Coatings Co. Ltd. Burlington, Ontario
RESPONDENT	Dan Mousseau Director of Buildings City of Burlington
PANEL	Kenneth Peaker, Chair Donald Pratt Gary Burtch
PLACE	Toronto, Ontario
DATE OF HEARING	November 8th, 2001
DATE OF RULING	November 8th, 2001
APPEARANCES	Wagdi Tadros, President Pyramids Engineering Inc. Richmond Hill, Ontario **Agent for the Applicant** J.T. Hewitson Building Inspector City of Burlington **Designate for the Respondent**

RULING

1. The Applicant

Harry Ziegler, Chief Engineer, Technical Coatings Co. Ltd., Burlington, Ontario, has received an Order to Comply under the *Building Code Act*, S.O. 1992, c. 23, as amended to remedy certain alleged deficiencies with respect to the interior stairs leading from the mezzanine area at Technical Coatings Co. Limited, 1164 Walkers Line, Burlington, Ontario.

2. Description of Construction

The Applicant is the Chief Engineer for Technical Coatings Co. Limited, a subsidiary of Benjamin Moore & Co. Limited. The subject building is classified as a Group F, Division 1, high hazard industrial occupancy. It has a total building area of 7572 m^2 and a building height of 1 storey. The structure is comprised of noncombustible construction and is fully equipped with sprinkler, fire alarm and standpipe and hose systems.

An addition has recently been constructed which includes a mezzanine area that serves as an access platform for the mixing tanks situated on the ground floor. The construction in dispute specifically involves the 5 stairways leading from this mezzanine. The metal stairways are 910 mm (3 ft) in width with an open riser design. The treads are comprised of serrated grating and the run of each stair measures 229 mm (9 in). The Code requires a minimum run of 255 mm (10 in) in this instance. Initially, the building's exterior stairs were also constructed with 229 mm (9 in) stair runs but have since been modified to comply to the Ontario Building Code (OBC) requirements. Because of physical constraints within the building, however, the Applicant would prefer not to modify the stairs from the mezzanine level.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the stairs to the mezzanine level with a run of 229 mm (9 in) per stair provide sufficiency of compliance with Sentence 3.4.6.7.(1) of the Ontario Building Code.

This provision in the code specifies that, except for situations not applicable here, the steps for stairs shall have a minimum run of not less than 255 mm (10 in) and not more than 355 mm (14 in) between each subsequent step.

The stairs to the mezzanine level for the subject building have a run of 229 mm (9 in). In recognizing this deficiency the Applicant has proposed certain compensating measures in an attempt to achieve sufficiency of compliance. These measures include additional stairways to the mezzanine level (all having stairs with a 229 mm run), improved lighting, extra safety features, serrated grating on the step tread and an open riser design.

4. Provisions of the Ontario Building Code

3.4.6.7. Treads and Risers

(1) Except as permitted for *dwelling units* and by Sentence 3.4.7.5.(1) for fire escapes, steps

for stairs shall have a run of not less than 255 mm (10 in) and not more than 355 mm (14 in) between successive steps.

5. Applicant's Position

The Applicant's Agent acknowledged that the newly constructed stairs from the mezzanine did not comply with the present OBC requirements. There was apparently an oversight in the reading of the Code during the construction phase. In the previous edition of the OBC, a nine inch run was permitted. He emphasized, however, that in his opinion, the stairs were not unsafe. He suggested that the run of the stairs in the addition was consistent with the stairs in the original building and that all employees using the mezzanine were familiar and comfortable with this length of run. He further suggested that any hazard posed by the nonconforming stair runs would be diminished by the fact that there are 5 stair cases serving the mezzanine area while only 2 are required by the Code.

The Agent submitted that he has received advice from the Ministry of Labour suggesting that the run of the stairs could be considered acceptable from a safety standpoint. In addition he emphasized that, prior to the 1997 Code, a nine inch run was acceptable throughout the province. Numerous facilities have been constructed using this run dimension. He also stated that this design has been used elsewhere within Benjamin Moore facilities as well as in many industrial work platforms in the United States. While he acknowledged the present OBC requirements, he was confident that no hazard was created in the use of these stairs.

The Agent outlined several safety features that would support his proposal for a reduced run. He advised that the stairs have open risers which will provide for additional foot room on the tread. He also suggested that the serrated grating and static dissipating shoes required to be worn by all employees would decrease the risk of slipping on the stairs. He argued that the area is well lit and he offered to post signs in the area advising staff to make use of the handrails when walking on the stairs. It would be unlikely that workers would be carrying equipment onto the stair case and would, therefore, have their hands free at most times. The Agent also advised that the mezzanine is not a permanent part of the building. If Technical Coatings Co. Limited were to relocate the mezzanine would be disassembled. It is specific to the paint mixing operation being undertaken.

The Agent advised the Commission that the exterior stairs had been constructed using the same dimensions but have since been modified to a Code compliant design. It was recognized that the exterior stairs may, at times, be used by members of the public, however with respect to the stairs from the mezzanine, the Agent emphasized that only employees had access to this area. He also expressed concern about modifying the stair run in this area of the building. With an increased run, he argued, the stairs would extend into the floor area used by fork lifts, thus, posing more of a hazard for those using the stairways.

6. Respondent's Position

The Respondent submitted that a permit was issued in October 2000. The stairs were reviewed and found to be compliant at that time. Upon inspection, however, it was noted that, the uniform run for all stairs was nine to nine and a quarter inches.

The Designate recognized the safety measures being offered by the Applicant and conceded that the additional stairway exceed the OBC requirements, however, he submitted that the stair run is a minimum and, in his opinion, safety would be compromised by the reduction. He advised that one

could feel the difference between a nine inch and a ten inch run, particularly when descending a stairway.

In summation the Designate noted that the previous standard in the Code had been changed based on the findings of an accident study that was conducted. He also submitted that the National Building Code had increased the stair run requirement from nine inches to eleven inches. He suggested that these are significant amendments that should be considered when contemplating a reduction in the minimum requirement. He emphasized that the stairs are an integral part of the egress route and, by not complying with relevant, present day standards, the risk of hazard would be increased.

7. Commission Ruling

It is the decision of the Building code Commission that the as-constructed stairs that provide access to the mezzanine level in an industrial occupancy and having a minimum run of approximately 229 mm (9 in) do not provide sufficiency of compliance with Sentence 3.4.6.7.(1) of the Ontario Building Code at 1164 Walkers Line, Burlington, Ontario.

8. Reasons

i) The stair run does not comply with the OBC provisions outlined in Sentence 3.4.6.7.(1) and, when considering the compensating measures to be provided, sufficiency of compliance has not been achieved.

ii) The 1997 Ontario Building Code increased the minimum run requirement by 25 mm, from 230 mm to 255 mm. As noted in the technical background report submitted by the Building and Development Branch of the Ministry of Municipal Affairs and Housing, this amendment was a result of “extensive research into stair design and its impact on accidents and injuries on stairs”. In light of such a recent amendment, it would not be appropriate to revert back to a standard that was found to be unacceptable when the latest edition of the Code was published.

PLACE	Toronto, Ontario
DATE OF HEARING	October 25th, 2001
DATE OF RULING	October 25th, 2001
APPEARANCES	Judy and Michael Djurdjevic, owners The Old Bank House Niagara-on-the-Lake, Ontario **The Applicants** Rolf Wiens Assistant Chief Building Official Town of Niagara-on-the-Lake **Designate for the Respondent**

RULING

1. The Applicant

Judy and Michael Djurdjevic, owners, The Old Bank House, have applied for a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended and have undertaken renovations at 10 Front Street, Niagara-on-the-Lake, Ontario.

2. Description of Construction

The Applicants are the owners of a building known as The Old Bank House. The original building was constructed in 1902 and served as the first branch of the Bank of Canada in Niagara-on-the-Lake. In the 1940s and 1950s the building was operated as a guest house and in the mid 1970s it was converted to a bed and breakfast facility and now operates as a 9 bedroom country inn. The building is classified as having a Group C occupancy. It is comprised of combustible construction, is equipped with a fire alarm system and is partially sprinklered. The structure has a building area of 566.7 m^2 (6,100 ft^2) according to the Applicant and 549.7 m^2 (5,917 ft^2) according to the Respondent.

The building has been recently renovated by the Applicants. The construction in dispute involves the exterior guards that have been installed for the second floor balconies serving three of the guest suites. The metal guards are 1,070 mm (42 in) in height and contain two horizontal members along the lower portion. The lowest of these members is approximately 50 mm (2 in) above the floor level, whereas the higher member is approximately 150 mm (5 7/8 in) to 160 mm (6 1/4 in) from the finished floor. The guard also incorporates some decorative detailing along its upper portion, just below the handrail. This detailing is located approximately 940 mm (37 in) from the floor level and is situated at roughly 780 mm (30 3/4 in) to 790 mm (31 1/8 in) from the highest of the two lower members.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the as-installed guards having a horizontal member located approximately 150 mm to 160 mm above the floor level provides sufficiency of compliance with Sentence 9.8.8.5.(1) of the Ontario Building Code (OBC).

Sentence 9.8.8.5.(1) mandates that required guards serving building of residential occupancy shall be designed so that no member, attachment or opening located between 100 mm (4 1/8 in) and 900 mm (35 3/8 in) above the walking surface will facilitate climbing. In this instance, the higher of the two lower horizontal members occurs at approximately 150 mm to 160 mm above the floor level. However, it should be noted that the decorative detailing at the top of the guard is located approximately 940 mm from the floor. The separation between the two elements is 780 mm to 790 mm.

4. Provisions of the Ontario Building Code

9.8.8.5. Design to Prevent Climbing

(1) *Guards* required by Article 9.8.8.1. and serving *buildings* of *residential occupancy* shall be designed so that no member, attachment or opening located between 100 mm (4 in) and 900 mm (2 ft 11 in) above the floor or walking surface protected by the *guard* will facilitate climbing.

5. Applicant's Position

The Applicants advised they acquired this building in 1996 and, through the course of their renovations, consulted with a number of individuals and organizations in their attempt to maintain the historic character of the structure. This included some precise design detailing that was thought to exemplify the appropriate time period. As part of their consultations they looked at constructing guards for the second floor balconies that would have been similar in nature to the guard surrounding the porch on the lower level. They were advised that the characteristics of the porch guard would not conform with today's Building Code requirements. They were then advised that the requirements for new guards were a minimum height of 1,070 mm and a maximum opening between balusters of 100 mm.

Keeping those requirements in mind and, after consulting with the Town's architectural committee about the guard design, a permit was applied for and issued. It was not until the final inspection that they were advised of the problem respecting the horizontal members along the bottom of the guard. They now understand that this does not comply with the strict wording of the Code but are appealing to the Commission to view the discrepancy as a minor one. The Applicants emphasized that, in their view, these railings do not pose a safety hazard. They do not facilitate climbing and no ladder effect is created. They argued that, to remedy the situation at this point would not be a simple exercise. The guards are handmade and would have to be completely removed and replaced to strictly comply with the requirements. This endeavour would be quite costly.

In support of their submission, the Applicants advised that the guards in question are located on the second floor and cannot be accessed by the general public. They serve the private bedroom suites of guests to the bed and breakfast. They also advised that the establishment caters to adults only. It is a policy of their operation that children under 14 are not permitted. In addition, they advised that the property is monitored 24 hours a day and keyed access to the rooms is required to gain entry to the area. They also submitted that the balconies themselves are relatively small and would not function as a space for gatherings.

In summation, the Applicants emphasized that they do not want to jeopardize the safety of any of the occupants of this building in any way. They have exceeded Code requirements in a number of areas and were simply unaware of the requirement regarding horizontal members within the guard design. When they did become aware, they explored options to comply but, in all instances, the historic look of this feature would have been compromised. They also noted that the decorative detailing along the top of the guard is at 940 mm from the finished floor. They believe that this maintains the intent of the Code to protect the area between 100 mm and 900 mm from being used for climbing, despite the horizontal member at the bottom being slightly higher than permitted.

6. Respondent's Position

The Designate for the Respondent submitted that the building was classified for review under Part 9 of the OBC, being that it is a small bed and breakfast with an area of approximately 5,900 ft^2. When the permit was issued the municipality did not have any drawing to review the design of the railings. It was not until final inspection that it was visually noted that the higher of the horizontal members at the bottom of the guard exceeded the 100 mm provision. At that time, it was discussed with the builder and the architect which part of the OBC would apply to this structure. The Designate advised that the builder had suggested that the guard was constructed in accordance with the provision of Part 3. These provisions would have permitted a horizontal member at 140 mm (5 ½ in) above the finished floor. The guard that was eventually installed would still exceed those provisions, but not by as much.

The Designate maintained that the building falls within the parameters of Part 9 and, as such, the guard, with a horizontal member between 100 mm and 900 mm, does not comply with Code. His position therefore, was that he is unable to issue an approval in this circumstance.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-installed guard serving the second floor balconies and having a horizontal member located at approximately 160 mm about the finished floor provides sufficiency of compliance with Sentence 9.8.8.5.(1) of the Ontario Building Code at The Old Bank House, 10 Front Street, Niagara-on-the-Lake, Ontario.

8. Reasons

i) In Sentence 9.8.8.5.(1) the OBC sets out a vertical zone or band above a walking surface within which the design of a guard shall not facilitate climbing. This "safety zone" is established as 100 mm to 900 mm in height from its lower to upper limits with the width of the vertical band being 800 mm (31 ½ in). In the present instance, while the safety zone has been shifted slightly upwards it total width, measured between the top lower rail and the underside of the decorative detailing at the top of the guard, is approximately 780 mm (30 3/4 in) to 790 mm (31 1/8 in), or nearly 800 mm.

ii) There is no ladder effect created within this "safety zone".

iii) Access to the balcony areas is controlled and not open to the general public.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Articles 3.2.2.6. and 3.2.2.23 and Sentences 3.2.2.7.(1), 3.2.2.8.(1), 1.1.3.1.(1) and 1.1.3.2.(1) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Ray Mandel, Principal, The Terraces of Old Mill Developments Ltd., for the resolution of a dispute with Bruce Ashton, Deputy Chief Building Official, City of Toronto, to determine whether the ground floor amenity space (exercise room, swimming pool, change room and lounge), that is not proposed to be sprinklered, in a building containing a Group C major occupancy, provides sufficiency of compliance with Articles 3.2.2.6., 3.2.2.23. and Sentences 3.2.2.7.(1) and 3.2.2.8.(1) of the Ontario Building Code when considering Sentences 1.1.3.1.(1) and 1.1.3.2.(1), at the Old Mill Apartments, 2662 Bloor Street West, Toronto, Ontario.

APPLICANT	Ray Mandel, Principal The Terraces of Old Mill Developments Ltd. Toronto, Ontario
RESPONDENT	Bruce Ashton Deputy Chief Building Official City of Toronto
PANEL	Kenneth Peaker, Chair Fred Barkhouse Robert De Berardis
PLACE	Toronto, Ontario
DATE OF HEARING	October 25th, 2001
DATE OF RULING	October 25th, 2001
APPEARANCES	Allan Larden Larden Muniak Consulting Inc. **Agent for the Applicant** Tamer Mikhail Senior Plan Examiner City of Toronto **Designate for the Respondent**

RULING

1. The Applicant

Ray Mandel, Principal, The Terraces of Old Mill Developments Ltd., has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended and is constructing a residential apartment building known as the Old Mill Apartments at 2662 Bloor Street West, Toronto, Ontario.

2. Description of Construction

The Applicant is in the process of constructing a 12 storey, Group C, residential apartment building. When complete, it will have a total building area of 1,900 m^2. The structure is comprised of noncombustible construction and will be equipped with a fire alarm system and a standpipe and hose system. In addition, sprinklering is proposed for select areas of the building's ground floor, including the parking garage, garbage chute and vestibule, the garbage room and storage rooms.

The ground floor of the building is divided by a driveway which travels roughly through the middle of the structure and separates it into northeast and southwest portions. The northeast portion of the ground floor accommodates an enclosed storage garage while the southwest portion encompasses a number of distinct uses, including the apartment lobby, storage areas and a garbage room. The southwest portion of the ground floor also includes amenity space in the form of an exercise room, lap pool and change rooms.

The construction in dispute specifically involves this amenity space. The issue in this regard is whether this portion of the building is required to be sprinklered. The amenity space occupies a net area of 259 m^2 and is designed to serve the occupants of the building and their guests. It has an occupancy classification of Group A, Division 2 and amounts to approximately 14% of the ground floor area. This amenity space is considered by the Applicant to be ancillary to the major residential occupancy and therefore, no sprinklering is being proposed for this portion of the building.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the amenity space on the ground floor of the residential apartment building is required to be sprinklered or whether the absence of sprinklering provides sufficiency of compliance with Articles 3.2.2.6., 3.2.2.23. and Sentences 3.2.2.7.(1) and 3.2.2.8.(1) of the Ontario Building Code when considering Sentences 1.1.3.1.(1) and 1.1.3.2.(1).

Article 3.2.2.6. requires that, except as outlined in Articles 3.2.2.7. and 3.2.2.8. where a building contains more than one major occupancy, the requirement of the most restricted major occupancy shall apply to the whole building. Sentence (1) of Article 3.2.2.7., in reference to superimposed major occupancies, stipulates that in a building where one major occupancy is located entirely above another major occupancy, the requirements for each portion of the building accommodating a major occupancy will apply to that portion of the structure as if the entire building were of that occupancy classification. As an exception to this provision, Sentence 3.2.2.8.(1) provides that, for a building where the aggregate area of all major occupancies of any one Group or Division is less than 10% of the floor area or the storey in which they are contained, they need not be considered as major occupancies for the purposes of applying the building fire safety requirements, provided that they are not Group F, Division 1 or 2 occupancies.

Furthermore, Article 3.2.2.23. requires, among other things, that a building having a Group A, Division 2 occupancy classification be sprinklered and provide floor assemblies with a fire resistance rating of at least 2 hours.

Central to this dispute is the difference of opinion as to whether the amenity space must be considered a major occupancy, thereby necessitating the application of the more restrictive Code requirements, including the provision of sprinklering. Article 1.1.3.2. defines the term "major occupancy" as being the principal occupancy for which a building is intended to be used and shall be deemed to include subsidiary occupancies which are considered an integral part of that principal occupancy. Code users are informed in Article 1.1.3.1. that phrases and words such as "subsidiary" which are not defined in the Code are to assume the meaning most commonly assigned to them in the context in which they are used in the Code. As noted in the technical information provided by the Building and Development Branch of the Ministry of Municipal Affairs and Housing in connection with this application, "The Concise Oxford and Webster's New World dictionary use the following language to define 'subsidiary' as : Serving to assist or supplement; auxiliary; supplementary; being in a subordinate relationship, and to define 'principal' as: First in rank or importance; one to which another is subordinate."

In relation to this dispute, the amenity area is classified as a Group A, Division 2 occupancy. It represents 14% of the ground floor area of the building and thus, does not qualify for the exemption under sentence 3.2.2.8.(1). Nevertheless, according to the Applicant, the amenity space is meant to serve the occupants of the building and their occasional guests and should, therefore, be considered as an integral part of the principal occupancy. The Respondent, on the other hand, views the Group A, Division 2 use as a major occupancy which would be subject to the more restrictive Code requirements. The issue to be determined, therefore, is whether this amenity space must be sprinklered or, in the alternative, whether the omission of sprinklering in this area provides sufficiency of compliance with the provisions of the Code.

4. Provisions of the Ontario Building Code

1.1.3.1. Non-defined Terms

(1) Definitions of words and phrases used in this Code that are not included in the list of definitions in this Part shall have the meanings which are commonly assigned to them in the context in which they are used in this Code, taking into account the specialized use of terms with the various trades and professions to which the terminology applies.

1.1.3.2. Defined Terms

(1) The words and terms in italics in this Code have the following meaning for the purposes of this Code, and where indicated, the following meaning for the purposes of the Act as well.

3.2.2.6. Multiple Major Occupancies

(1) Except as permitted by Articles 3.2.2.7. and 3.2.2.8., in a *building* containing more than one *major occupancy*, the requirements of this Subsection for the most restricted *major occupancy* contained shall apply to the whole *building*.

3.2.2.23. Group A, Division 2, Any Height, Any Area, Sprinklered

(1) Except as permitted by Articles 3.2.2.24. to 3.2.2.28., a *building* classified as Group A, Division 2 shall conform to Sentence (2).

(2) Except as permitted by Article 3.2.2.16., the *building* referred to in Sentence (1) shall be of *noncombustible construction*, and

(a) except as permitted by Sentence 3.2.2.7.(1), the *building* shall be *sprinklered*,
(b) floor assemblies shall be *fire separations* with a *fire-resistance rating* not less than 2 h,
(c) *mezzanines* shall have a *fire-resistance rating* not less 1 h, and
(d) *loadbearing* walls, columns and arches shall have a *fire-resistance rating* not less than that required for the supported assembly.

3.2.2.7. Superimposed Major Occupancies

(1) Except as permitted by Article 3.2.2.8., in a *building* in which one *major occupancy* is located entirely above another *major occupancy*, the requirements in this Subsection for each portion of the *building* containing a *major occupancy* shall apply to that portion as if the entire *building* was of that *major occupancy*.

3.2.2.8. Exceptions for Major Occupancies

(1) In a *building* in which the aggregate area of all *major occupancies* in a particular Group or Division is not more than 10% of the *floor area* of the *storey* in which they are located, these *major occupancies* need not be considered as *major occupancies* for the purposes of this Subsection, provided they are not classified as Group F, Division 1 or 2 *occupancies*.

5. Applicant's Position

The Applicant's Agent advised an apartment building is currently being constructed on the undeveloped land near the Old Mill; south of Bloor Street, east of the Humber River valley. As part of this construction a modest amenity space is being incorporated into the design of the ground floor of the building. This space will include an exercise room, change rooms and a lap pool. This amenity space will overlook the adjacent ravine, southwest of the property.

The Agent submitted that the Respondent is regarding this amenity space as a major occupancy rather than one subsidiary to the residential occupancy of the building. As a result, he is requesting that the disputed area be sprinklered in accordance with the more restrictive provisions for Group A, Division 2 major occupancies. The Agent emphasized that this space was an amenity area for use by the individuals who live in the residential tower. He suggested that it is a natural part of the residential function of the building and therefore, subsidiary to the major occupancy which is not required to be sprinklered. In his opinion, no different standard should apply to the space at issue.

The Agent submitted that a major occupancy can incorporate subsidiary occupancies without having the higher standards applied to those areas. This amenity space, he argued, does not meet the definition of a major occupancy. It is an integral part of the major, Group C, occupancy in this circumstance. He also submitted that the area is supervised by a concierge who is able to observe access to the area, as well, video cameras will be installed to monitor the use of the pool.

In summation, the Agent stated that this is a relatively small area, incorporating approximately 14% of the ground floor. He submitted that the subject area contains a low fire load and represents little hazard to the building. It is not, in his opinion, a major occupancy that would require sprinklering.

6. Respondent's Position

The Designate for the Respondent submitted that, although the swimming pool is intended to be used by residents of the building, guests are often invited and the use of space, therefore, becomes much like that of a party room. The Code definition of public pool would include a pool designed for use by more than six units. The pool in question would meet that criteria.

In addition, the Designate advised that the City is also asking for sprinklering of the parking garage and garbage room. The Applicant is voluntarily providing sprinklering to those areas. In his opinion the sprinklering of the entire ground floor would prevent fire spread and potential building collapse. He acknowledged that the amenity space represented a relatively small portion of the building but advised that it totals more than 10% of the ground floor area. Furthermore, he submitted that the ground floor is comprised of F2, F3 and A occupancies. The floor area, he argued, is not used as a Group C occupancy and, in his view, the amenity space can be considered a major occupancy when applied to this floor level.

In summation, the Designate maintained that the amenity space is required to be sprinklered since it is a more restrictive occupancy classification. Furthermore, in light of the fact that the F3 parking garage and garbage room are to be sprinklered, he sees no reason why the sprinkler system could not be extended to cover this amenity space occupancy as well.

7. Commission Ruling

It is the decision of the Building Code Commission that the ground floor amenity space (exercise room, swimming pool, change room and lounge), that is not proposed to be sprinklered, in a building containing a Group C major occupancy, provides sufficiency of compliance with Articles 3.2.2.6., 3.2.2.23., and Sentences 3.2.2.7.(1) and 3.2.2.8.(1) of the Ontario Building Code when considering Articles 1.1.3.1. and 1.1.3.2., at the Old Mill Apartments, 2662 Bloor Street West, Toronto, Ontario.

8. Reasons

i) The area is considered an amenity space occupancy, accessory to the major occupancy, that will be used only by tenants and their guests.

ii) The space will be under video surveillance.

iii) The amenity space incorporates a lap pool which limits the number of persons capable of using the pool at any one time.

iv) The space will be monitored by heat detectors.

APPEARANCES	David Bailey, Operation Manager Bodycote Materials Testing Ltd. Mississauga, Ontario **Agent for the Applicant** Frank Spagnolo Manager, Building Engineering & Inspections City of Mississauga **Designate for the Respondent**

RULING

1. The Applicant

Nickolas Dorazio, Property Manager, Bodycote Property Holdings Inc., has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended and has undertaken renovations to the Bodycote Technology Centre building at 2395 Speakman Drive, Mississauga, Ontario.

2. Description of Construction

The Applicant operates a research laboratory facility known as the Bodycote Technology Centre. The structure is four storeys in height and has a total building area of 22,100 m^2. The building is comprised of noncombustible construction and is classified as a mix of Group D and Group F, Division 2 major occupancies. The building is fully sprinklered and is equipped with a fire alarm system and a standpipe and hose system.

The building was constructed in 1967 at which time it contained an administrative wing and three floors of lab facilities. Approximately 10 years ago, the corporation received funding from the province to under take improvements to the building. At that time, part of the facility was converted to rental accommodations. In addition, a number of renovations were undertaken. These renovations included improvements to building access, installation of an elevator and the addition of a sprinkler system. The building is now designed for multi-tenant use.

The construction in dispute involves the existing penetration of fume hood ductwork through the risers at each floor of the building. This ductwork serves as exhaust systems for each individual lab area. The main building contains over 168 risers and, of these, 104 have ductwork projecting through the floor and ceiling. This would account for over 273 sections of ductwork which is primarily comprised of heavy 16 gauge steel, with only 24 sections of ductwork composed of a lighter more conventionally designed steel. The ducts area able to withstand heat in excess of 400^{o}C and are protected by adjacent sprinkler heads.

In all cases, the original construction is such that the concrete floor was cast in place leaving openings for the installation of the subject ductwork. As a result of the nature of the laboratory operation the owners have determined that the ducts cannot be equipped with fire dampers at the required fire-rated separations because of potential toxicity. In addition, in light of the existing spatial constraints within these areas, it is impractical and/or impossible to wrap the exterior of the ductwork. To compensate for this element of compliance, the Applicant is proposing certain compensating measures and safety features including alarm networks, safety lighting, improved sprinkler system (one sprinkler head every 6 feet and in each riser), etc.

In addition, a detailed Riser Inspection Report was completed which outlines the safety characteristics of the service risers. This report confirms that access doors to the risers have locking cylinders which will prevent the storage of combustible material; the risers are sprinklered with heads located near the ceiling and set at 165^{o}C; there is “a continuous floor to ceiling rear block wall with limited access”; “all empty circular floor penetrations are filled with 3" of safing compressed to 50% and filled with ¼" 3M fire stop silicone. All metallic pipes or wire penetrating these circular openings are wrapped with 3" of safing compressed to 50% and filled with 3M fire stop silicone. All plastic pipes penetrating these circular openings are wrapped with 3M In Hole Plastic Pipe Fire Stop.” All features identified in the

Riser Report are offered to ensure the safety of the area in dispute in lieu of the inability to strictly comply with the present Building Code requirements.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the compensating measures proposed for where the dedicated fume hood ductwork traverses the 2-hour fire separations between floors in a multi-tenant building containing Group D and Group B occupancies, provide sufficiency of compliance with Articles 3.1.8.7. and 3.1.8.8. of the Ontario Building Code (OBC).

Article 3.1.8.7. requires that a duct which connects two fire compartments or penetrates an assembly be a fire separation and be equipped with a fire damper. In addition, where a required fire damper is used as a closure in a fire separation it shall have a fire-protection rating conforming to Sentence 3.1.8.4.(2). This requirement for the provision of fire dampers at every penetration of a required fire separation is intended to limit fire exposure through ductworks between compartments.

As an exception to Article 3.1.8.7., Article 3.1.8.8. outlines circumstances where the requirements for fire dampers would be waived. Sentence (1) of this Article permits the waiver of dampers where noncombustible ducts, which have a melting point above 760ºC, penetrate a required fire separation provided that these ducts serve only air-conditioning units or combined heating/air-conditioning units discharging air not more than 1,200 mm above the floor. This Sentence also permits the connection of these ducts to exhaust duct risers that are under negative pressure and in which the air is flowing upward and carried up, inside the riser, not less than 500 mm.

Sentences (2) through (7) of Article 3.1.8.8. outline other exceptions to the provision of fire dampers. These would include a) a continuous noncombustible duct which penetrates a vertical or horizontal fire separation which is not required to have a fire resistance rating, b) a noncombustible duct which penetrates a fire separation that separates a vertical service space from the rest of the building provided that the duct has a melting point above 760ºC and that each duct exhaust directly to the outside at the top of the vertical service space, c) a continuous noncombustible duct with a melting point above 760ºC that penetrates a vertical fire separation as required by Sentence 3.3.1.1.(1) between suites other than residential, care or detention occupancies, d) a duct that serves commercial cooking equipment, and e) a duct having a melting point above 760ºC located in elementary and secondary schools that pierces a fire separation having a resistance rating of 30 minutes.

The ductwork subject to this dispute penetrates the required fire separations between floor assemblies, however, no fire dampers are proposed in light of the potential for the spread of toxic gases throughout the building. It is recognized that the existing ductwork does not meet any of the specific criteria for an exemption from the provision of fire dampers. In light of this, measures to compensate for the fire damper requirement are proposed to achieve a measure of sufficiency of compliance in this situation.

4. Provisions of the Ontario Building Code

3.1.8.7. Fire Dampers

(1) Except as permitted by Article 3.1.8.8., a duct that connects 2 *fire compartments* or that penetrates an assembly required to be a *fire separation* shall be equipped with a *fire damper*.

(2) A *fire damper* required by Sentence (1) or a *fire damper* used as a *closure* in a *fire separation* shall have a *fire-protection rating* conforming to Sentence 3.1.8.4.(2).

3.1.8.8. Fire Dampers Waived

(1) *Fire dampers* need not be provided in n*oncombustible* branch ducts that have a melting point above 760°C (1,400°F) and that penetrate a required *fire separation* provided the ducts

(a) serve only air-conditioning units or combined air-conditioning and heating units discharging air not more than 1 200 mm (3 ft 11 in) above the floor and have a cross-sectional area not more than 0.013 m^2 (20 in^2), or

(b) are connected to exhaust duct risers that are under negative pressure and in which the air flow is upward as required by Article 3.6.3.4. and are carried up inside the riser not less than 500 mm (19¾ in).

(2) A continuous *noncombustible* duct penetrating a vertical *fire separation* not required to have a f*ire-resistance* rating need not be equipped with a *fire damper* at the *fire separation*.

(3) A n*oncombustible* duct that penetrates a horizontal *fire separation* not required to have a *fire-resistance rating* need not be equipped with a *fire damper* at the *fire separation*.

(4) A *noncombustible* duct that penetrates a *fire separation* that separates a *vertical service space* from the remainder of the *building* need not be equipped with a *fire damper* at the *fire separation* provided

(a) the duct has a melting point above 760°C (1,400°F), and

(b) each individual duct exhausts directly to the outside at the top of the *vertical service space*.

(5) A continuous *noncombustible* duct having a melting point above 760°C (1,400°F) that penetrates a vertical *fire separation* as required by Sentence 3.3.1.1.(1) between *suites* of other than *residential* or *care or detention occupancy* need not be equipped with a *fire damper* at the *fire separation*.

(6) A duct that serves commercial cooking equipment and penetrates a required *fire separation* need not be equipped with a *fire damper* at the *fire separation*. (See also Article 6.2.2.6.)

(7) In elementary and secondary schools, a continuous *noncombustible* duct having a melting point above 760°C (1,400°F) that pierces a *fire separation* having a *fire-resistance rating* of 30 min need not be equipped with a *fire damper* at the *fire separation*.

5. Applicant's Position

The Agent for the Applicant outlined the key issues in dispute. Essentially, the ducts which penetrate required fire-rated separations are not provided with fire dampers and cannot be successfully wrapped. He explained that the building was constructed in 1967 and has been used for laboratory services. The facility is designed with individual independent labs, each with the capabilities for performing different services or testing.

The Agent advised that, approximately 10 years ago, funding was received from the province to facilitate building improvements. As a result, a number of changes were proposed to improve the facility. When examining the situation involving the risers questions were raised with respect to Code compliance. A review of all risers was undertaken and a Riser Inspection Report was generated to address each

individual riser. Each of the 168 risers, he explained, have access doors and many have ductwork which penetrate the fire separation between floors. At this point, he emphasized that Bodycote was meticulous about removing combustibles from the risers. He stated that all doors are locked and supervised by the property manager. Staff and maintenance workers do not have free access to these areas.

The Agent submitted that the duct work is essential for the operation of this building as it is used to exhaust fumes that may be generated by the labs. He explained that the ducts are in close proximity to the block walls (within a few millimetres) surrounding the risers. As a result, it would be difficult, if not impossible to adequately wrap the ducts. He also submitted that the fume hoods which the ductwork serves are the first line of defence if smoke was detected within a lab. These are not automatically activated but are turned on by personnel within those areas. Fire dampers would defeat that purpose and would pose a potential hazard where toxic chemicals inside the labs are present. The fume hoods, he also submitted, are inspected monthly and audited for function.

In summation, the Agent noted that Bodycote would like to rent space to prospective tenants and is requesting a finding from the Commission for sufficiency of compliance based on the compensating measures being proposed to ensure the safety of both persons and property. He suggested that the function of the building, despite having multiple tenants, will not have changed significantly from its original purpose. He also advised that an approved fire safety plan is in place and a number of safety features that would maintain the spirit of the OBC requirements are being offered.

6. Respondent's Position

The Designate for the Respondent submitted that as a result of the change in use from a single tenant building to a multi-tenant format, safety concerns were identified and many have been addressed by the Applicant. Items such as exit doors and the provision of public corridors have been upgraded to meet the current Code standards. He advised that the Applicant has been very responsive to concerns that have been raised. Only the issue with respect to the subject duct penetrations remains outstanding. He submitted that it was originally thought compliance could be addressed by wrapping ducts but it was discovered that this would not be possible given the physical constraints of the space in question.

The Designate advised that it was their position that Article 3.1.8.8. did not provide the flexibility for him to find this situation in compliance with the Code. The fire separation, he submitted, must be maintained because none of the exceptions warrant the waiver of fire dampers. He had no discretion in this regard and therefore had no option but to deny the proposal, despite the compensating measures proposed.

The Designate advised that his primary concern is with respect to the increased risk associated with a multi-tenant building in relation to the 168 risers at issue. He stated that this building was constructed under the previous Building Code requirements and acknowledged the tight constraints and the numerous services located within the disputed areas. Despite this retrofit situation, however, he was unable to accept the proposal under Part 11 of the Code now that the use of the building has changed.

7. Commission Ruling

It is the decision of the Building Code Commission that the compensating measures offered in the multi-

tenant building containing group F, Division 2 and Group D occupancies where the dedicated fume hood duct work traverses the 2-hour fire separations between floors, will provide sufficiency of compliance with Articles 3.1.8.7. and 3.1.8.8. of the Ontario Building Code at the Bodycote Technology Centre, 2395 Speakman Drive, Mississauga, Ontario on condition that:

a) The vertical separation between the labs and the corridor must be continuous from one floor slab to the underside of the floor slab above.

b) The vertical service shaft must be separated between the lab and corridor from the floor slab to the underside of the floor slab above.

c) The metal doors in the floor slab, that are not being used as service penetrations, must be protected with rated separations equivalent to the floor rating.

d) The sprinkler system must be expanded to include the concealed space above the corridor ceiling.

8. Reasons

i) With implementation of the above conditions, the requirements of the OBC will be adequately addressed and sufficiency of compliance will be achieved.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 3.2.9.1.(1) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Art Rebek, Engineering Manager, Jungbunzlauer Canada Inc., for the resolution of a dispute with Dave Rose, Chief Building Official, City of Port Colborne, to determine whether the compensating measures offered in lieu of standpipe and hose systems in buildings containing Group F, Division 2, Group F, Division 3 and Group D occupancies provide sufficiency of compliance with Sentence 3.2.9.1.(1) of the Ontario Building Code at Jungbunzlauer Canada Inc. facility, 1555 Elm Street, Port Colborne, Ontario.

APPLICANT	Art Rebek, Engineering Manager Jungbunzlauer Canada Inc. Port Colborne, Ontario
RESPONDENT	Dave Rose Chief Building Official City of Port Colborne
PANEL	Kenneth Peaker, Chair Fred Barkhouse Robert De Berardis
PLACE	Toronto, Ontario
DATE OF HEARING	October 25th, 2001
DATE OF RULING	October 25th, 2001
APPEARANCES	Gino Niro Sandwell Consulting Engineers Ltd. Burlington, Ontario **Agent for the Applicant** Dave Rose Chief Building Official City of Port Colborne **The Respondent**

RULING

1. The Applicant

Art Rebek, Engineering Manager, Jungbunzlauer Canada Inc., Port Colborne, Ontario, has received a building permit under the Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended and is constructing an industrial complex to be operated by Jungbunzlauer Canada Inc. at 1555 Elm Street, Port Colborne, Ontario.

2. Description of Construction

Jungbunzlauer Canada Inc. (JBL) is a manufacturer of food grade citric acid, commonly found in a vast range of products. The process involves the specialized fermentation of corn syrup which results in the production of citric acid solution. This solution is then dried to form citric acid crystals. The proposed JBL facility incorporates a number of buildings which would include a large Citric Acid Plant Building and five other ancillary buildings identified as Stores, Spores, Utility, Maintenance and Drying Buildings. The buildings subject to this dispute include the Citric Acid Plant and Drying Building.

The Citric Acid Plant itself has an area of 8,518 m^2 and is subdivided into five smaller buildings by firewalls. The buildings formed by these firewalls are identified as follows: (A) the Packing, Storage and Shipping Building, having a height of one storey, (B) the Centrifugation Building, having a height of four storeys, (C) the Filtration and Purification building, with a height of three storeys, (D) Preparation, Offices and Staff Facilities Building, being five storeys in height and (E) the Fermentation and Compressor Room building, which is two storeys high. These buildings are equipped with a fire alarm system and are classified as Group F, Division 3 occupancies with the exception of Building A, the Packing and Storage building, which has a Group F, Division 2 occupancy classification. In addition, Building D includes a three storey office component as a subsidiary occupancy.

The Drying Building has an area of 886 m^2 an is a single storey structure. It has a sloped roof which reaches a maximum height of 14.5 m. Both the Citric Acid Plant Buildings and the Drying Building are of noncombustible construction. They are not equipped with either a sprinkler system and only Building D is to be equipped with a standpipe and hose system.

The construction in dispute relates to the proposed omission of the required standpipe and hose systems in the Citric Acid Plant Buildings A, B, C and E and the Drying Building. As compensation for not providing this system the Applicant is offering a ULC listed fire alarm system in all buildings with the exception of the Drying Building. In addition, ABC fire extinguishers are to be provided within 30 ft of all motors in lieu of type A extinguishers located at 15.24 m intervals (10.06 m in the office area) throughout the building. As well, the stairs which provide a means of egress from all floors in Buildings B, C and D are to be constructed having a 2-hour fire resistance rating as opposed to the 45 minute (Buildings B and C) and 1-hour (Building D) ratings required by Code. The Applicant also notes that all personnel would be required to carry radio handsets to permit immediate communication and will receive training in fire safety and first aid procedures.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the compensating measures offered in lieu of a standpipe and hose system in the Citric Acid Plant Buildings A, B, C and E and the

Drying Building will provide sufficiency of compliance with Article 3.2.9.1. of the Ontario Building Code (OBC).

This provision of the Code sets out the parameters under which the installation of a standpipe and hose system would be required. The standpipe requirement is determined according to the major occupancy, size and height of the building. In this case the building sizes exceed either the permitted number of storeys, building height or building area. As noted, however, the Applicant is offering certain compensating measures in lieu of providing the standpipe system. At issue then, is whether the subject measures are sufficient to compensate for the required standpipe and hose systems.

4. Provisions of the Ontario Building Code

3.2.9.1. Standpipe Systems - Where Required

(1) Except as provided in Sentences (4) to (7), a standpipe system shall be installed in every building that

(a) is more than 3 storeys in building height,
(b) is more than 14 m (45 ft 11 in) high measured between grade and the ceiling of the top storey, or
(c) is not more than 14 m (45 ft 11 in) high measured between grade and the ceiling of the top storey but has a building area exceeding the area shown in Table 3.2.9.1. for the applicable building height if the building is not sprinklered.

5. Applicant's Position

The Applicant advised the Commission that Jungbunzlauer is a company based out of Austria. It is in the business of manufacturing citric acid and is currently constructing a facility in the City of Port Colborne. As a result of the process of obtaining approvals for their proposed facility, several aspects of construction have arisen which were not familiar to the parent company. One such aspect was the requirement for a standpipe and hose system. The Agent suggested that they had never encountered the need for such a system at facilities established in other countries around the world.

In requesting approval for the omission of the required standpipe and hose system the Agent stated that the basic reasoning behind this request is threefold. First, the buildings in question are noncombustible. Second, the product is primarily noncombustible and, third, there is a relatively low overall occupancy load within the buildings. The plant, he argued is fully automated with only 6 people working in the processing area.

The Agent submitted that the Citric Acid Plant building has been divided into fire compartments to prevent or slow the spread of fire between buildings. It was initially their intent to have the requirement for standpipe waived in all building areas but they have since agreed to install this feature in Building D containing the office area, which has a higher occupant load. The question remains, he submitted, whether the other buildings were required to be similarly equipped when considering the nature of the operation and the compensation being offered.

In this regard, the Agent stated that the JBL facility was comprised of a number of buildings. Building A, used for warehousing and packaging is an F2 occupancy. The proposal is to install additional heat

detectors and use ABC type extinguishers in lieu of a standpipe and hose system in this location. In respect to Building B, where the citric acid is filtered, the Agent argued that this process is a closed system. Equipment is of stainless steel construction and the area is a dry production area. He acknowledged the additional fire load in this building as a result of the electrical equipment employed in this area but suggested that the fire extinguishers to be provided would be preferable for fighting any type of electrical fire that may occur. In respect to Building E, where the fermentation process is carried out, the Agent submitted that this is a very wet area with limited access. In this regard there is very little that could burn and fire extinguishers would be adequate to fight fire in that area.

In addition to the low occupancy and noncombustible construction, the Agent submitted that they have employed a number of other safety features. These features include the proposal to install a fire alarm system throughout the facility with pull stations and a 24 hour/day manned control station. They are also proposed to train employees in the use of extinguishers, first aid and evacuation procedures and to provide them with handsets for immediate communication. As well, the fire department response time to reach this facility is very short, being approximately 5 minutes from the time a call is received. In summation, the Agent argued that, in light of all of these considerations, there was really no justification for standpipe and hose systems in the subject buildings.

6. Respondent's Position

The Respondent submitted that, although the Applicant has offered measures to compensate for the required standpipe and hose systems, the City does not have the authority to accept this proposal. The Code is specific in its requirement for a standpipe and hose in this situation and they are not permitted to make an exception in this regard.

7. Commission Ruling

It is the decision of the Building Code Commission that the compensating measures offered in lieu of standpipe and hose systems in buildings containing Group F, Division 2, Group F, Division 3 and Group D occupancies do not provide sufficiency of compliance with Sentence 3.2.9.1.(1) of the Ontario Building Code at Jungbunzlauer Canada Inc. facility, 1555 Elm Street, Port Colborne, Ontario.

8. Reasons

i) The compensating measures offered are not adequate to provide sufficiency of compliance with the Building Code requirements.

ii) The manufacturing processes within the buildings are not such that a hazardous situation would be created if a standpipe and hose system is introduced to the structures.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Articles 11.4.1.1., 11.4.2.5. and 11.4.3.6. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by James and Gloria Vasey, property owners, for the resolution of a dispute with Bob Hexter, Chief Building Official, County of Lambton, Ontario, to determine whether the use of the existing septic system on a property where the reconstruction of a single detached residential dwelling is proposed due to the destruction of existing dwelling by a house fire, provides sufficiency of compliance with Articles 11.4.1.1., 11.4.2.5. and 11.4.3.6. of the Ontario Building Code at 4490 LaSalle Line, Township of Enniskillen, County of Lambton, Ontario.

APPLICANTS	James and Gloria Vasey Property owners Watford, Ontario
RESPONDENT	Bob Hexter Chief Building Official County of Lambton
PANEL	Frank Wright, Chair-Designate Doug Robinson Bill Fellner
PLACE	Toronto, Ontario
DATE OF HEARING	October 11, 2001
DATE OF RULING	October 11, 2001
APPEARANCES	James and Gloria Vasey Property owners **The Applicants** Mark Wetering Septic Systems Administrator County of Lambton **Designate for the Respondent**

RULING

1. The Applicant

James and Gloria Vasey, property owners, have applied for a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended and are proposing to reconstruct a single detached dwelling that was destroyed as a result of a fire at 4490 LaSalle Line, Township of Enniskillen, County of Lambton, Ontario.

2. Description of Construction

The Applicants are proposing to reconstruct a Class C residential building, having a building area of 140 m^2. The original dwelling was destroyed by fire in November 1999. The replacement dwelling is smaller in building area and will contain 22.5 plumbing fixture units (no more than the original structure). The Applicants are proposing to use the existing Class 4 septic system to service the new house that would be constructed to replace the damaged one.

The septic system itself was undamaged by the fire that razed the building. The soil on site is clay having a percolation rate of T = 60 minutes. The existing septic tank operates with a working capacity of 3600 litres. The system is equipped with a chlorination chamber and a filtration bed, with trenches measuring 16.76 m in length, for the treatment of effluent. Leading from the filtration bed is a pipe designed to discharge effluent into a municipal ditch along LaSalle Line. This ditch is located approximately 150 to 180 m from the bed.

The construction in dispute involves the design and operation of the existing septic system. The system serving this property was designed 1977 and permits surface discharge to a ditch along an adjacent roadway. This type of operation is typically referred to as an “under drain system”. The system was approved for use by the County of Lambton in 1978 but would currently not be permitted by the either the Ontario Building Code or the Ontario Water Resources Act.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the use of the existing septic system to serve a single detached residential dwelling that will replace a building, destroyed as a result of a house fire, provides sufficiency of compliance with Articles 11.4.1.1., 11.4.2.5. and 11.4.3.6. of the Ontario Building Code (OBC).

Article 11.4.1.1. states that the performance level of a building after construction shall not be less than the performance level of the building prior to construction. It further indicates that Subsection 11.4.2. shall be considered when making any determination regarding a reduction in performance level. In addition the Article also notes that, where the proposed construction would reduce the performance level of a building, compensating construction would be required.

When having regard to whether the performance level of a building is reduced, Article 11.4.2.5. sets out several situations that would result in such a reduction. These situations include cases where a sewage system serving an existing building would be adversely affected by the proposed construction, an increase in the occupant load of a building, an increase in the number of bedrooms, an addition of more than 15% to the building area of an existing dwelling, an increase in the number of the plumbing fixtures and a change of major occupancy which, together or alone, would result in a daily design sewage flow in excess of the designed capacity for the existing sewage system. In other words, if the resultant increase in the daily design sewage flow, due to any of the above conditions, exceeds the capacity of the septic system, the performance

level is reduced.

If the performance level of a dwelling is reduced, Sentence (1) of Article 11.4.3.6. requires sufficient up-grading of the components of an existing septic system to comply with the requirements of Part 8 of the OBC. This sentence applies if one of the conditions specified in Article 11.4.2.5. leads to a reduction in the performance level of an existing dwelling.

In the present case the reconstruction of the building would not appear to involve any of the above situations identified by the Building Code as contributing to the reduction in performance level. The proposed dwelling will be smaller in size than the original and no additional plumbing fixtures are anticipated. In fact, it may be presumed that the new fixtures would work more efficiently than the original ones. In addition, there will be no change in occupancy and no additional occupant load to be accommodated.

The issue between the parties remains, however, whether the system must be upgraded in light of its design and operation.

As noted above, the existing sewage disposal system operates so as to permit surface discharge into an open ditch along an adjacent roadway. It should be noted that Subsection 8.9.1. of the Ontario Building Code prohibits the discharge of effluent onto the surface of the ground. This requirement applies to all "sewage systems" constructed in accordance with the Ontario Building Code requirements. The operation in dispute, as previously stated, was approved by the Region in 1978 under previous guidelines established by the Ministry of the Environment. When applying the present criteria for evaluating a sewage disposal system, the existing operation could be considered to be a "sewage work" as defined and regulated by the *Ontario Water Resources Act*.

4. Provisions of the Ontario Building Code

11.4.1.1. Performance Level

(1) The *performance level* of a *building* after *construction* shall not be less than the *performance level* of the *building* prior to *construction*.

(2) For the purposes of Sentence (1), reduction of *performance level* shall be determined in accordance with Subsection 11.4.2.

(3) Where the proposed *construction* would reduce the *performance level* of an existing *building*, compensating *construction* shall be required in conformance with Subsection 11.4.3.

11.4.2.5. Sewage Systems

(1) The *performance level* of an existing *building* is reduced where the existing *building* is extended or subject to material alteration or repair and a *sewage system* serving the existing *building* is adversely affected by the extension, alteration or repair of the existing *building*.

(2) Except as provided in Sentence (3), the *performance level* of an existing *building* is reduced where proposed *construction* will increase the *occupant load* of an existing *building*, and the new *occupant load* will result in the total daily design *sanitary sewage flow* of the *building*, calculated in accordance with Article 8.2.1.3., exceeding the capacity of any component of a *sewage system* serving the *building*.

(3) The *performance level* of an existing *dwelling unit* is reduced where *proposed construction* which,

(a) increases the number of bedrooms in the *dwelling unit*,

(b) exceeds 15% of the finished area of the *dwelling unit*, or

(c) adds new *plumbing fixtures to the dwelling unit*,

will result in the total daily design *sanitary sewage* flow of the *dwelling unit*, calculated in accordance with Article 8.2.1.3., exceeding the capacity of any component of a *sewage system* serving the *dwelling unit*.

(4) The *performance level* of an existing *building* is reduced where proposed *construction* will result in the change of a *major occupancy* of all or part of the existing *building* to another *major occupancy* and:

(a) the total daily design *sanitary sewage flow* of the proposed *major occupancy*, calculated in accordance with Article 8.2.1.3., exceeds the capacity of any component of a *sewage system* serving the *building*, or

(b) the type or amount of *sanitary sewage* which will, under the proposed *major occupancy*, be discharged to a *sewage system* serving the *building*, is prohibited by Article 8.1.3.1..

11.4.3.6. Sewage Systems

(1) Where the *performance level* of an existing *building* is reduced under Article 11.4.2.5., upgrading of a *sewage system* which is adversely affected by the *construction*, increase in *occupant load*, increase in the total daily design *sanitary sewage* flow or change in amount or type of *sanitary sewage* shall be required in conformance with Part 8.

5. Applicant's Position

The Applicants explained that their house was destroyed by fire in 1999. For some time they were uncertain as to whether they were going to rebuild or relocate. When the decision to rebuild was made they applied to the Town for a permit. It was their intention to use the existing sewage system to serve the proposed building as it had not sustained any damage in the fire and was oversized to begin with. They submitted that the municipality would not approve their building permit because of some concerns with respect to their sewage system.

They were advised by municipal staff that the existing system was no longer legal and would have to be replaced. They then investigated with their insurance provider and were advised that a replacement septic system would not be covered under their policy. This left them with the responsibility for paying for the total cost of replacing a system that had been approved by the municipality and had been functioning efficiently for quite some time. The only change in circumstance occurred because their house had to be rebuilt. The new house, they argued, is smaller and would have less impact on the existing system than the original. The performance level of the sewage system would not be reduced as a result of this construction.

The Applicants feel justified in asking that their system be "grandfathered" and, thereby, a permit issued for the new building. They merely want to restore the situation that existed prior to the unforseen destruction of their home. In respect to concerns raised regarding surface discharge, they argued that, in all their years living on the property, they have never observed any discharge from the pipe into the roadside ditch.

6. Respondent's Position

The Respondent submitted that, in the past, Lambton County had approved many of these types of "under drain" systems under the *Environmental Protection Act*. In 1981 the regulations changed and there were no further approvals given. Since that time, it has been the municipality's policy to require replacement of any

of the existing under drains when any new construction was to occur. They recognized the problems with this type of system but the problem became an enforcement issue.

The Respondent argued that the *Building Code Act* and the Ontario Building Code are clear on prohibiting a system which discharges to a water body. While he recognizes that the new construction will not increase the building size or the occupant load, he considers the current septic system to be unsafe and, based on the municipality's policy, it should be replaced. He suggested that, when the operation doesn't comply with Part 8 of the Code, Part 11 cannot even be applied. The impact on performance level is, therefore, not an issue. The system is simply not covered, nor permitted, by the Building Code.

7. Commission Ruling

It is the decision of the Building Code Commission that 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended, the Building Code Commission does not have the jurisdiction to determine this dispute.

8. Reasons

i) Under s. 24(1) of the *Building Code Act*, the Building Code Commission has jurisdiction to resolve disputes:

- that are between a chief building official or building inspector and an applicant for, or holder of, a permit or a person to whom an order is given; and

- that concern the interpretation of, or the sufficiency of compliance with, the technical requirements of the Ontario Building Code.

In this case, while the Commission acknowledges that there is a dispute between the Chief Official and the Applicant, the parameters of that dispute fall outside the provisions of the Ontario Building Code.

ii) The Ontario Building Code provides definitions for both "sewage system" and "leaching bed". Neither definition can be applied to the existing septic disposal method employed on this site. The operation is better defined as "sewage works" which is governed by the provisions of the *Ontario Water Resources Act*.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentences 11.4.2.5.(3) and 11.4.3.6.(1) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by George and Christina Toulouse, property owners, for the resolution of a dispute with Fritz Enzlin, Deputy Chief Building Official, Municipality of Chatham-Kent, Ontario, to determine whether the performance level of the existing septic system, when considering a proposed second storey addition that will include a three piece ensuite bathroom, provides sufficiency of compliance with Sentences 11.4.2.5.(3) and 11.4.3.6.(1) of the Ontario Building Code at 5038 Dufferin Avenue, Wallaceburg, Municipality of Chatham-Kent, Ontario.

APPLICANT	George and Christina Toulouse Property owners
RESPONDENT	Fritz Enzlin Deputy Chief Building Official Municipality of Chatham-Kent
PANEL	Frank Wright, Chair-Designate Doug Robinson Bill Fellner
PLACE	Toronto, Ontario
DATE OF HEARING	October 11, 2001
DATE OF RULING	October 11, 2001
APPEARANCES	George and Christina Toulouse **The Applicants** Fritz Enzlin Deputy Chief Building Official Municipality of Chatham-Kent **The Respondent**

RULING

1. The Applicant

George and Christina Toulouse, property owners, have applied for a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended and are proposing to construct an addition to their dwelling at 5038 Dufferin Avenue, Wallaceburg, Municipality of Chatham-Kent, Ontario.

2. Description of Construction

The Applicants are proposing to construct an addition to the second floor of their existing residential (Group C occupancy) dwelling. The proposed construction would enlarge the master bedroom and include a three piece ensuite washroom. This would increase the total number of plumbing fixture units in the building from 11 to 17 and would generate a total daily design sewage flow of 1600 litres per day.

The Applicants are not proposing any changes or upgrades to the existing sewage system which was installed in 1970. The existing sewage system is described by the Respondent as a conventional Class 4 sewage treatment facility, comprised of a 600 gallon tank and approximately 250 ft of weeping tile in 5 runs. This description is based on an earlier Certificate of Approval issued for the existing system. The site itself is relatively flat with a percolation time for the native soil of approximately 30 minutes.

The construction in dispute involves the working capacity of the existing septic system in light of the proposed addition to the building and the resulting increase in total daily design flow.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the performance level of the existing septic system, when considering the proposed addition that includes a three piece bathroom, provides sufficiency of compliance with Sentences 11.4.2.5.(3) and 11.4.3.6.(1) of the Ontario Building Code (OBC).

Sentence 11.4.2.5.(3) sets out the situations that would reduce the performance level of an existing dwelling. These situations include an increase in the number of bedrooms, an addition of more than 15% to the building area of an existing dwelling and an increase in the number of the plumbing fixtures that, together or alone, would result in a daily design sewage flow in excess of the designed capacity for any component of the existing sewage system. In other words, if the resultant increase in the daily design sewage flow, due to any of the above conditions, exceeds the capacity of one component or the whole septic system, the performance level of the dwelling is reduced.

If the performance level of a dwelling is reduced, Sentence 11.4.3.6.(1) requires up-grading of an existing septic system to comply with the requirements of Part 8 of the OBC. This sentence applies if one of the conditions specified in Sentence 11.4.2.5.(3) leads to a reduction in the performance level of an existing dwelling.

In the present case the addition to the subject dwelling includes a three piece ensuite bathroom which would increase the total number of plumbing fixture units from 11 to 17. Therefore, at issue is whether the existing septic system will sufficiently comply with the requirements set out in the Building Code or whether the system will require upgrading.

4. Provisions of the Ontario Building Code

11.4.2.5. Sewage Systems

(3) The *performance level* of an existing *dwelling unit* is reduced where *proposed construction* which,

(a) increases the number of bedrooms in the *dwelling unit*,
(b) exceeds 15% of the finished area of the *dwelling unit*, or
(c) adds new *plumbing fixtures to the dwelling unit*,

will result in the total daily design *sanitary sewage* flow of the *dwelling unit*, calculated in accordance with Article 8.2.1.3., exceeding the capacity of any component of a *sewage system* serving the *dwelling unit*.

11.4.3.6. Sewage Systems

(1) Where the *performance level* of an existing *building* is reduced under Article 11.4.2.5., upgrading of a *sewage system* which is adversely affected by the *construction*, increase in *occupant load,* increase in the total daily design *sanitary sewage* flow or change in amount or type of *sanitary sewage* shall be required in conformance with Part 8.

5. Applicant's Position

The Applicants advised that they are seeking to construct an addition to the second floor of their existing dwelling. This addition would include a three piece ensuite bathroom. They submitted that when they applied for a permit for the anticipated construction, municipal officials advised that the existing septic system would require upgrading.

The Applicants argued that, while there may be an increase in the number of plumbing fixtures, there would continue to be only two people living in the building and that no additional sewage would be generated. The washroom on the second floor, they argued, is merely a convenience. They continued by submitting that they had raised a family in the existing dwelling and had never encountered any problems with respect to the septic system. In their opinion, the current capacity has always been adequate and they do not agree with the contention that, simply by adding some plumbing fixtures, the system will become overloaded.

In summation they argued that the existing system would continue to be sufficient to accommodate the daily sewage flow from their dwelling. They maintained their assertion that no additional sewage would result from the proposed addition.

6. Respondent's Position

The Respondent submitted that, when applying the criteria outlined in Part 11 of the Building Code, the proposed addition will decrease the performance level of the building because of the additional fixture units proposed. He agreed that the existing system is not failing but emphasized that the provisions of the Code are clear in this respect.

The Respondent advised the Commission that, based on the specifications outlined in the Certificate of Approval that was issued in 1970, the total daily design flow calculated based on the requirements of

Part 8 will exceed the capacity of the existing system. As such, he was unable to issue a permit for the proposed construction.

7. Commission Ruling

It is the decision of the Building Code Commission that the performance level of the existing septic system, when considering a proposed second storey addition that will include a three piece bathroom, does not provide sufficiency of compliance with Sentences 11.4.2.5.(1), 11.4.2.5.(3) and 11.4.3.6.(1) of the Ontario Building Code at 5038 Dufferin Avenue, Wallaceburg, Municipality of Chatham-Kent, Ontario.

8. Reasons

1. The total daily design flow, when considering the increase in fixture units from 11 to 17, would exceed the design capacity for the existing system. As a result, the additional fixture units proposed in the present case would decrease the performance level of the existing building.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 11.3.3.1.(1) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Bruce Schulz, co-owner of the property, for the resolution of a dispute with Chris Mowat, Chief Building Official, Township of Faraday, to determine whether the construction of a replacement deck provides sufficiency of compliance with Sentence 11.3.3.1.(1) of the Ontario Building Code at 383 Pine Drive, Township of Faraday, Ontario.

APPLICANT	Bruce Schulz Property co-owner
RESPONDENT	Chris Mowat Chief Building Official Township of Faraday
PANEL	Len King, Chair-Designate Fred Barkhouse John Guthrie
PLACE	Toronto, Ontario
DATE OF HEARING	September 27th, 2001
DATE OF RULING	September 27th, 2001
APPEARANCES	Carl Schulz **Agent for the Applicant** Chris Mowat Chief Building Official Township of Faraday **The Respondent**

RULING

1. The Applicant

Bruce Schulz, co-owner of the property, has received an order to comply under the *Building Code Act*, S.O. 1992, c. 23, as amended, to remedy certain alleged deficiencies with respect to a replacement deck at 383 Pine Drive in the Township of Faraday, Ontario.

2. Description of Construction

The Applicant and his brother are the co-owners of a cottage in the Township of Faraday. The building is a one storey seasonal dwelling having a Group C occupancy and a building area of 74.32 m^2 (800 sq ft).

The construction in dispute involves the recent repair and replacement of an exterior rear yard deck, which the Applicant believed to have been constructed during the 1960s. After the time of purchase in 1999, it was discovered that the lumber comprising the original deck was rotting and considered unsafe by the present owners. As a result, the deck was demolished and reconstructed in the same location. This replacement deck is the same size and configuration as the deck that was in existence at the time of purchase. It has been placed on the same ground pads as the original and is comprised of 4" x 4" vertical posts and 2" x 6" floor boards as decking. Minor changes to the design of the original structure include the support joists, which have now been spaced 406 mm (16 in) on centres, as opposed to 609 mm (24 in) on centres for the previous deck. In addition, the stairway and stair treads are wider than what had appeared on the original structure.

The dispute primarily centres around the guard that has been provided for the reconstructed deck. It consists of 4" x 4" pressure treated lumber support posts connected by two 2" x 6" horizontal members. The top of the lowest member is approximately 457 mm (18 in) from the finished floor and the top of the handrail reaches a height of approximately 787 mm (31 in) from the deck floor. These dimensions are consistent with the design of the original deck.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the replacement deck construction provides sufficiency of compliance with Sentence 11.3.3.1.(1) of the Ontario Building Code (OBC).

Article 11.3.1.1. requires that, where a building system is altered or repaired, the performance level of the building must be at least equal to the performance level of the building prior to the material alteration. Sentence 11.3.3.1.(1) outlines the provisions for basic renovation and states that, except as noted in Article 11.3.3.2., construction may be carried out to maintain the performance level of an existing building. This can be achieved by the reuse, relocation or extension of the same or similar materials, provided that the construction will not adversely affect things such as certain safety features or the structural adequacy of the building.

In this instance, a dilapidated deck was removed and replaced using new materials. The structure has the same general dimensions and design as the original, however, the guard of both the original deck and the replacement structure contains a horizontal member that may be considered climbable when considering other provision of the OBC. In addition, the horizontal loading capacity and structural integrity of the guard has not been determined.

4. Provisions of the Ontario Building Code

11.3.3.1. Basic Renovation

(1) Except as provided in Sentence (2) and Article 11.3.3.2., *construction* may be carried out to maintain the existing *performance level* of all or part of an existing *building*, by the reuse, relocation or extension of the same or similar materials or components, to retain the existing character, structural uniqueness, heritage value, or aesthetic appearance of all or part of the *building* if, the *construction* will not adversely affect the early warning and evacuation systems, fire separations, the structural adequacy or create an unhealthy environment in the *building*.

5. Applicant's Position

The Agent for the Applicant began his submission by referring to two photographs of the rear of the cottage. The photographs allowed for comparison of the deck prior to reconstruction with the structure that is the subject of this hearing. In addition, he presented a copy of the real estate listing of the previous owner which included a photograph of the cottage showing the subject deck. He advised that after the time of purchase, the original deck was discovered to be rotten and was crumbling underfoot. He brought to the hearing a sample of the wood from the original deck as proof of that claim.

To remedy the unsafe situation, the Applicant had initially considered replacing just the individual floor boards but discovered that the frame was also an issue. As a result, it was determined to be prudent to remove the existing structure and reconstruct a replacement deck of the same size and configuration. This work was completed in the summer of 2000. In the Agent's opinion, the Applicant has reconstructed a deck of the same size and design as the original. He submitted that this was a basic renovation and repair and, therefore, at the time of construction, he didn't think that a building permit was required.

The Agent argued that the newly constructed deck does not lessen, but in fact increases, the performance level of the building and retains the character of what existed prior to the renovation. In his opinion, the deck is safer and stronger now than it was before the repair work had been done.

The Agent advised that it was his understanding that the Respondent's primary concern was with respect to the climbability of the guard. His position was that the guard was no more hazardous now than prior to the reconstruction. He argued that the character of the guard is identical to the original and, although there is a horizontal member that may be considered climbable when considering other provisions of the Code for new construction, it should not be considered as a factor in this circumstance.

6. Respondent's Position

The Respondent submitted that he has viewed this deck as being new construction. Based on his information and previous inspections, nothing was discovered to indicate that there was a deck on this property immediately prior to the recent construction. He advised that a situation occurred with a previous owner in the year 1989, whereby it was discovered that the location of the cottage crossed over a property line. As a result, the cottage was moved to a location wholly on the lot in question. The Respondent advised that, during all of the inspections conducted at that time he did not observe a deck, nor was there any reference to the deck in the detailed notes kept in regard to this work.

The Respondent advised that his ultimate concern is with respect to the safety of the construction undertaken. He submitted that, because a permit had not been applied for, no inspections were conducted during construction to ensure compliance with the OBC. In respect to the climbability issue, the Respondent acknowledged that, if the deck were an existing structure then the replacement guard posed no greater hazard than what had previously existed. The issue that would remain a concern for him in that instance would be whether the guard is structurally sound. At this point he had no information that would convince him that structural adequacy is not an issue. In addition, he noted that the Applicant had not applied for a permit and no formal inspection had been carried out.

The Respondent concluded that, assuming the deck were an existing structure, and if he were convinced as to the structural integrity of the guard, he would be satisfied that the deck complied with the OBC provisions as outlined in Part 11.

7. Commission Ruling

It is the decision of the Building Code Commission that the replacement deck provides sufficiency of compliance with Sentence 11.3.3.1.(1) of the Ontario Building Code at 383 Pine Drive, Township of Faraday, Ontario on condition that:

a) The Applicant apply for a building permit.
b) The guard is reinforced, if necessary, to comply with the structural requirements of the OBC.
c) A handrail is provided for the stairs of the deck.

8. Reasons

i) Upon fulfilment of the above conditions, the deck will provide sufficiency of compliance with the OBC provisions.
ii) The replacement deck retains the existing character and aesthetic appearance of the original structure.
iii) The existing guard design is acceptable with respect to climbability and openings since the guard replaces an existing guard in accordance with Part 11 of the Ontario Building Code.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Sentence 3.4.2.5.(2) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Mario Pecile, Project Manager, Magna-MI Developments Inc., Aurora, Ontario, for the resolution of a dispute with Mr. Mani Navabi, Director of Building Standards, City of Vaughan, Ontario, to determine whether the proposed main aisles in a Group F, Division 2 industrial building, which include several direction changes, lead through doors in interior partitions, and which lead to the exit doors located at 60 metre intervals around the perimeter of the building, provide sufficiency of compliance with Sentence 3.4.2.5.(2) of the Ontario Building Code at Splitcraft/STT Technologies, 800 Tesma Way, Vaughan, Ontario.

APPLICANT	Mr. Mario Pecile, Project Manager, Magna-MI Developments Inc. Aurora, Ontario
RESPONDENT	Mr. Mani Navabi Director of Building Standards City of Vaughan
PANEL	Mr. Len King, Chair-Designate Mr. Fred Barkhouse Mr. John Guthrie
PLACE	Toronto, Ontario
DATE OF HEARING	September 27th, 2001
DATE OF RULING	September 27th, 2001
APPEARANCES	Mr. Randal Brown, President Randal Brown & Associates **Agent for the Applicant**
	Mr. Mani Navabi, Director of Building Standards City of Vaughan **The Respondent**

RULING

1. The Applicant

Mr. Mario Pecile, Project Manager, Magna-MI Developments Inc., Aurora Ontario, has applied for a building permit under the Building Code Act, 1992 and is proposing an expansion of the industrial plant known as Splitcraft/STT Technologies, 800 Tesma Way, Vaughan, Ontario.

2. Description of Construction

The Applicant is proposing the expansion of its existing Splitcraft/STT Technologies facility in Vaughan. The building is one storey in building height and, when completed, will have an area of 17,187.5 m^2, including the northern, southern and eastern expansions. The structure is comprised of noncombustible construction and is equipped with a sprinkler system, a fire alarm system and a standpipe and hose system.

The existing building is currently subdivided into several areas by partitions, creating rooms of varying sizes. With the additions, the two east-west exit corridors in the existing building will be eliminated and replaced by two continuous east-west partitions. The partitions will subdivide the western portion of the final building into three sections, with access to each section through egress doors in the partitions. The southern addition will be separated from the western addition and from the existing building by continuous east-west running partitions.

As a result of the increase in building area and the configuration of the expanded structure, it is no longer possible to achieve the 45 m travel distance to an exit, as outlined in the OBC. Exit doors, therefore, have been located, at minimum, every 60 m around the perimeter of the facility. This is in accordance the Building Code requirements where the 45 m travel distance cannot be achieved. The construction in dispute, however, specifically involves the layout of the main aisles that lead to these required exits. The aisles that are provided to link the perimeter exit doors on opposite sides of the building incorporate several direction changes and, where an aisle crosses a partition, double swinging egress doors have been provided.

In light of the aisle design, and to facilitate the evacuation of the building in an emergency, the Applicant is proposing a number of added measures. There will be extra aisles and perimeter doors, in excess of OBC requirements, incorporated into the design of the facility. In addition, the main aisles will be identified by yellow floor markings throughout the building and arrows will be utilized where a slight change in direction occurs. It is also proposed that exit signs will be located approximately 2.74 m (9 ft) above the finished floor over the egress doors that lead through partitions.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the design of the main aisles leading to the required exits located at 60 m around the perimeter of the building, provides sufficiency of compliance with Sentence 3.4.2.5.(2) of the Ontario Building Code.

Sentence 3.4.2.5.(2) provides relief from Sentence 3.4.2.5.(1). Sentence 3.4.2.5.(1) would require a maximum travel distance of 45 m from a floor area to an exit in this instance. Sentence 3.4.2.5.(2) provides that Sentence (1) need not apply if exits are placed at 60 m intervals along the perimeter of the building provided that each main aisle leads directly to an exit.

In this instance, exit doors are proposed to be placed, at minimum, 60 m around the perimeter of the building, with additional exits also incorporated into the design of the facility. The dispute in respect to this provision of the Code centres around whether the main aisles can be considered to lead "directly" to a required exit. As mentioned above, the main aisles includes several direction changes and travel through double swinging egress doors between partitions.

4. Provisions of the Ontario Building Code

Sentence 3.4.2.5.(2) **Location of Exits**

(2) Except for a *high hazard industrial occupancy*, Sentence (1) need not apply if *exits* are placed along the perimeter of the *floor area* and are not more than 60 m (196 ft 10 in) apart, measured along the perimeter, provided each main aisle in the *floor area* leads directly to an *exit*.

5. Applicant's Position

The Applicant's Agent provided a brief history of this dispute, advising that he had been working for some time to achieve a consensus on this issue with municipal officials. He submitted that the Building Code doesn't cover every situation that may occur and, in his considerable experience, the concept of aisles that deviate from a straight line design has never before been an issue. He provided the Commission with several examples of buildings where similar aisle patterns can be found. These buildings encompassed varied uses and occupancies. The Agent submitted that, in almost all cases the aisles do not provide a straight line approach to the exit.

The Agent continued by submitting that, in a real life setting one would find many areas in a building separated by partitions. For example, office areas would be separated from production areas. Main aisles only need to occur every 60 m throughout the facility. In his opinion, the open space concept, with the grid line aisle pattern anticipated by the municipality, doesn't work out in the field. In this regard, the Agent submitted that the Applicant has already made many concessions in an attempt to achieve a visual openness for the facility. They have proposed the deletion of several overhead doors and have agreed to add glass to several of the partition doors. He submitted, however, that in some areas this approach would not be desirable. Splitcraft is a manufacturer of automotive parts and portions of the facility are quite noisy given the nature of the operation.

The Agent submitted that all areas of the building have access to two means of egress. In some cases there are additional aisles provided in excess of the OBC requirements. The aisles in this facility exceed the minimum 1,100 mm width requirement and will be clearly identified with floor markings and arrows to indicate any change in direction. He further advised that the facility was clean and bright with a high roof deck. This feature should alleviate any concern with respect to smoke obscuring the floor markings. In addition, the Applicant advised that there will be additional exit signs located above partition and exit doors. He further outlined that, as part of the Fire Safety Plan, visitors must be signed in and escorted by an employee at all times.

The Applicant's Agent brought a Building Action Newsletter, published by the Housing Development and Buildings Branch of the Ministry of Municipal Affairs and Housing, dated August 1989, to the Commission's attention. This newsletter offered discussion about the use of partitions and essentially suggested that, where partitions are used, as is the case here, there must be openings to facilitate the path of travel. There is no mention of any requirement for an open floor area. The Agent submitted that, in the proposed design, doorway openings have been provided in the partitions to facilitate a continuous path of travel to the required exits.

In summation, the Agent stated that, despite some change in direction, the facility provides an open view along wide main aisles and guidance to the exits will be provided by the additional measures being proposed in this building. He stated that partitions are not prohibited by the Code and with the additional egress aisles, exits and compensating measures to be provided, in his opinion, sufficiency of compliance is achieved in this instance.

6. Respondent's Position

The Respondent submitted that, from his point of view, the dispute is relatively simple. The problem here results from an extension of the original building whereby the 45 m travel distance would have initially been applied. As a result of the additions, a 45 m travel distance is no longer possible and the Applicant must turn to the alternative offered in Sentence 3.4.2.5.(2). This exception states that, if the 45 m distance cannot be achieved, exit doors must be located every 60 m around the perimeter of the facility. When this occurs, main aisles must lead "directly" to an exit. He further stated that, while the OBC does not define "directly" the dictionary definition suggests that it means a straight line - not crooked.

In this regard, the Respondent submitted, the Code anticipates a grid like main aisle pattern to the exits around the perimeter with internal aisles leading to the main aisles. He suggested that, if this interpretation is not used then aisles that do not lead "directly" to exits would be created, plus, the 45 m travel distance would be exceeded. This application would meet neither provision outlined in the Code. He noted that, in this proposal, some aisles require several direction changes and, therefore, do not meet the intent of the OBC.

He further submitted that the presence of partitions is another complication that is not specifically addressed in the Code. In his opinion, passing through a partition does not provide a "direct" path of travel to an exit. In addition, the presence of partitions could complicate the recognition of smoke or fire in other areas of the building.

In summation, the Respondent stated that with a greater number of buildings being expanded beyond a level where the maximum travel distance can be obtained, this provision of the Code is being used more often. He understands the complications involved in this area but maintains that, in his opinion, the proposal before the Commission does not comply with the Building Code.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed main aisles, which include several direction changes and lead through doors in the interior partitions, and which lead to the exit doors located at 60 metre intervals around the perimeter of the building, do not provide sufficiency of compliance with Sentence 3.4.2.5.(2) of the Ontario Building Code at Splitcraft/STT Technologies, 800 Tesma Way, Vaughan, Ontario.

8. Reasons

i) The main aisle pattern proposed cannot be considered to lead directly to the exits as is required by Sentence 3.4.2.5.(2) of the Building Code.

ii) The measures proposed to compensate for the direction changes and partitions fail to provide sufficiency of compliance for the direct line of travel anticipated by the Code.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Clause 3.4.2.5.(1)(c) and Sentence 3.1.8.12.(3) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Geordan Green, Designer, PBK Architects, for the resolution of a dispute with Bruce Poole, Chief Building Official, City of Guelph, to determine whether the distance from the rear of the dressing room area to an exit (in excess of 45 m) and the doors to the ice resurfacing room, that are not equipped with self-closing devices activated by a smoke detector, provide sufficiency of compliance with Clause 3.4.2.5.(1)(c) and Sentence 3.1.8.12.(3) of the Ontario Building Code at the West End Community Recreation Centre, Guelph, Ontario.

APPLICANT	Geordan Green, Designer, PBK Architects Toronto, Ontario
RESPONDENT	Bruce Poole Chief Building Official City of Guelph
PANEL	Len King, Chair - Designate Fred Barkhouse John Guthrie
PLACE	Toronto, Ontario
DATE OF HEARING	September 27th, 2001
DATE OF RULING	September 27th, 2001
APPEARANCES	Les Muniak Larden Muniak Consulting Inc. Toronto, Ontario **Agent for the Applicant** Paul Moore Permit & Zoning Administrator City of Guelph **Designate for the Respondent**

RULING

1. The Applicant

Geordan Green, Designer, PBK Architects, has received a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is constructing a recreation centre known as the West End Community Recreation Centre in the City of Guelph, Ontario.

2. Description of Construction

The Applicant is constructing a recreational complex known as the West End Community Recreation Centre. The building is classified as a Group A, Division 3 major occupancy and will include Group A, Division 2 and Group D subsidiary occupancies. The structure has a building area of 11,416 m^2 and is comprised of noncombustible construction. The facility will be equipped with a sprinkler system and a fire alarm system.

The construction in dispute involves two areas of concern. The first disputed item is the travel distance from the rear the dressing room area to the nearest required exit. In this regard, the rear portion of at least two of the dressing rooms serving the ice rinks will exceed the maximum 45 m travel distance by, at most, 5 m to 6 m. This area of the dressing rooms includes the shower stalls and toilets representing a total occupant load of approximately 5 or 6 people. To compensate for the excess distance, it is proposed that a curtain wall between the two ice pads be installed as a non-rated smoke barrier. Doors on this curtain wall, linking the ice pads, would be equipped with positive latching and self closing devices.

The second item of construction in dispute involves the overhead doors serving the ice resurfacing room. The doors form part of the required fire separation and are to be equipped with hold open devices. The devices, however, are not designed to release upon activation of a smoke detector located in accordance with OBC requirements. In defence of this area of noncompliance, the Applicant cites the fact that there are no listed smoke detectors that are certified to work within an ice rink environment.

3. Dispute

The issues in dispute between the Applicant and Respondent are whether the travel distance from the rear of the dressing room area, and the proposed doors to the ice resurfacing room, provide sufficiency of compliance with Clause 3.4.2.5.(1)(c) and Sentence 3.1.8.12.(3) of the Ontario Building Code (OBC).

Clause 3.4.2.5.(1)(c) requires that, except for certain situations not applicable here, an exit must be located so that the travel distance does not exceed 45 m. In this case, the rear portion of the dressing room areas will exceed the 45 m travel distance by approximately 5 m or 6 m. To compensate for this, the Applicant has installed a non-rated curtain wall between the ice rinks, designed to facilitate smoke control. In addition, a timed egress analysis has been conducted and, while not literally accepted by the OBC as an equivalent to compliance, it is offered to illustrate the effect of the deficiency on exiting the building.

In respect to the dispute involving the overhead doors to the ice resurfacing room, Sentence 3.1.8.12.(2) of the Code provides that, with certain exceptions not applicable here, a hold-open device

permitted by Sentence (1) must be designed to release by a signal from an automatic sprinkler system, a heat-actuated device, fusible link or a smoke detector located as described in Appendix B of NFPA 80, "Standard for Fire Doors and Fire Windows". In this instance, the doors to the ice resurfacing room form part of the fire separation and are to be equipped with hold open devices. They are not, however, proposed to incorporate self-closing devices designed to be activated by smoke detectors located so as to meet the applicable standard. NFPA 80 would require smoke detectors to be placed on either side of the doors in question. The hold-open devices would then be designed to release upon activation of either detector. The proposal here does not anticipate smoke detectors in the vicinity of the overhead doors.

4. Provisions of the Ontario Building Code

Clause 3.4.2.5. Location of Exits

(1) Except as permitted by Sentences (2), (3) and 3.3.2.4.(6), if more than one *exit* is required from a *floor area*, the *exits* shall be located so that the travel distance to at least one *exit* shall be not more than

(c) 45 m (147 ft 8 in) in a floor area that contains an *occupancy* other than a *high hazard industrial occupancy*, provided it is *sprinklered*,

3.1.8.12. Hold-Open Devices

(1) A hold-open device is permitted on a door in a required *fire separation*, other than an *exit* door in a *building* more than 3 *storeys* in *building height*, and on a door for a vestibule required by Article 3.3.5.7., provided the device is designed to release the door in conformance with Sentences (2) to (7).

(2) Except as required by Sentences (3), (5), (6) and (7), a hold-open device permitted by Sentence (1) shall be designed to release by a signal from

(a) an automatic sprinkler system,
(b) a heat-actuated device,
(c) fusible link, or
(d) a *smoke detector* located as described in Appendix B of NFPA 80, "Standard for Fire Doors and Fire Windows".

(3) Except as required by Sentences (4), (5), (6) and (7), a hold-open device permitted by Sentence (1) shall be designed to release upon a signal from a *smoke detector* located as described in Appendix B of NFPA 80, "Standard for Fire Doors and Fire Windows", if used on

(a) an *exit* door,
(b) a door opening into a *public corridor*,
(c) an egress door referred to in Sentence 3.4.2.4.(2),
(d) a door serving
  (i) an *assembly occupancy*,
  (ii) a *care or detention occupancy*, or
  (iii) a *residential occupancy*, or
(e) a door required to function as part of a smoke control system.

5. Applicant's Position

The Applicant's Agent's outlined the nature and function of the proposed recreation centre advising that the items of dispute were confined to the arena area, which incorporates two ice rink pads. These ice rinks are to be separated by a floor to ceiling wall and are served by a series of change rooms and an ice resurfacing room.

In respect to the issue of travel distance, the Agent advised that the rear portion of at least two of the dressing rooms in the centre of the building would exceed the allowable travel distance of 45 m. This space includes a small portion of the dressing areas, the shower stalls and toilets. It was suggested that, overall, a relatively small occupant load would be anticipated in these portions of the dressing rooms.

To illustrate the effect of the difference in travel time, the Applicant's Agent advised that a timed exit analysis was prepared. This analysis was based on the methodology set out in the SFPE Handbook of Fire Protection Engineering, 2nd Edition. It was argued that the assumed travel time for a Code complying structure would be 1 - 2 minutes to evacuate a room and 3 - 5 minutes to evacuate a floor area. He further submitted that, based on their analysis, a measured time to travel to an exit from the areas exceeding the maximum allowable travel distance was approximately 39 seconds to the closest exit and 48 seconds to the alternate exit. Based on this analysis, he concluded that the travel times involved are significantly less than those anticipated by the OBC.

In addition to the timed analysis, the central wall dividing the ice rinks was initially offered to the municipality as a smoke separation in an attempt to compensate for the excess distance. Doors, forming part of this curtain wall, were to be equipped with hold open devices to provide access between ice pads. In light of the use of these hold open devices, the municipality was also requiring self closures that would be activated upon actuation of listed smoke detectors. At that point, it was then discovered that there are no listed smoke detectors certified for use within the cold environment of an ice rink. The Respondent, therefore, advised that they could not consider this an adequate measure of compensation.

The issue with respect to technical limitations of listed smoke detectors raised an additional question with respect to compliance in the area of the ice resurfacing room. The Agent questioned whether, in fact, closures were required for the doors of the ice resurfacing room. He suggested that these types of closures were more appropriate in convention centres or similar facilities with lower ceiling heights. In any event, to satisfy the requirements for the use of hold open devices on the doors of this room would include release by activation of smoke detectors located on both sides of the door. This would again, require a smoke detector within the ice rink environment. The Applicant argued that the limitations on the technical capabilities of the smoke detectors made this an impossible restriction to comply with.

In support of the current design of the facility, the Applicant emphasized that the doors to this room will close upon activation of the fire alarm system and a heat activated fusible link. When questioned, the Agent also agreed to the provision of a smoke detector in the warm environment of the ice resurfacing room. He further submitted that the partition between the two ice rinks, while not protected as desired by the municipality, will offer an additional level of protection to occupants of the building by inhibiting the spread of smoke between the two ice rink areas. He noted too, that the building is fully sprinklered and has a high ceiling. This would be a factor in the activation of the fire alarm system before the smoke detectors would be triggered.

In summation, the Agent addressed the two areas in dispute. He stated that the excess distance

beyond what the Code permits will not likely be a factor in the efficient exiting of the facility. The difference in time to exit would be minimal. In respect to the issue of the hold open devices being released by smoke detectors he submitted that, even if smoke detectors were located within the ice rink environment, the manufacturers would not certify their operation. There is no guarantee that they would be at all effective. The Agent further submitted that the safety features in place would be sufficient to achieve an acceptable level of compliance with the intent of the Code requirements.

6. Respondent's Position

The Designate for the Respondent submitted that, with respect to the issue of travel distance, the Code maximum is exceeded in the rear change room area. An acceptable method of compensation was offered by the Applicant in lieu of compliance with the 45 m travel distance requirement. This compensation involved the provision of a dividing wall between the two arenas. The wall was initially proposed as a one hour fire separation but was subsequently reduced to a 0 hour separation with additional smoke detectors. The Designate advised that doors located in this separation would require self-closures to release the hold-open devices, thereby closing upon activation of the smoke detectors and the fire alarm system. Furthermore, he advised that he no longer considers the wall to be adequate compensation for the excess travel distance in that the Applicant is not providing the agreed upon smoke detection to activate the self-closures.

The Designate further commented that the Applicant's difficulty in providing smoke detectors in the area of the dividing wall also brought to light a further issue involving the requirement for smoke detectors which would activate the self-closing devices employed on the doors to the ice resurfacing room. He indicated that there was some debate as to whether these door were serving an assembly occupancy and therefore are required to release upon a signal from a smoke detector located as described in Appendix B of NFPA 80, "Standard for Fire Doors and Fire Windows". In support of his position that self closures are required, he submitted that although used primarily for ice rink purposes, this facility has the capability to be used for trade shows and other such exhibitions. This would result in a higher occupant load in the arena area. He suggested that the ice resurfacing room was the primary access for vehicles to load and unload onto the surface of the ice rinks.

In summation the Respondent submitted that that other facilities have employed smoke detectors within the ice rink environment without incident. He did concede, however, that the smoke detectors may not be as effective in a cold environment, especially when combined with the high ceiling of the facility.

7. Commission Ruling

It is the decision of the Building Code Commission that:

i) the travel distance from the rear portion of the dressing room area to the nearest exit, which would slightly exceed the 45 m requirement, provides sufficiency of compliance with Clause 3.4.2.5.(1)(c); and,

ii) the doors to the ice resurfacing room which are provided with hold open devices that are not designed to release upon activation of a signal from a smoke detector located as described by NFPA 80 will provide sufficiency of compliance with Sentence 3.1.8.12.(3) of the Ontario Building Code on condition that:

The hold open devices be designed to release upon activation of:

a. The fire alarm system;
b. A heat activated fusible link; and,
c. A smoke detector, located in the vicinity of each door within the warm environment of the ice resurfacing room.

8. Reasons

i) The applicant has carried out an engineering study using an accepted methodology which shows the measured time of travel to two exits is less than the design time of a Code complying structure to one exit.

ii) Only a relatively small area of the building, with a low estimated occupant load, is at most 5 m to 6 m in excess of the 45 m maximum travel distance.

iii) There are no listed smoke detectors certified to work in a cold ice rink environment. This technological limitation prevents strict compliance with the requirement for the hold open devices to release as anticipated by the OBC.

iv) Fulfilment of the conditions of this decision will achieve sufficiency of compliance with the intent of the OBC requirements.

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentences 3.2.4.19(7) and 3.2.4.20.(1) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Dr. J. MacRae, for the resolution of a dispute with Dan Mousseau, Chief Building Official, City of Burlington, to determine whether the direct supervision of patients at all times in lieu of providing visual signal devices where sound booths will be used provides sufficiency of compliance with Sentences 3.2.4.19.(7) and 3.2.4.20.(1) of the Ontario Building Code at 777 Guelph Line, Suites 201 and 212, Burlington, Ontario.

APPLICANT	Dr. J. MacRae 777 Guelph Line Burlington, Ontario
RESPONDENT	Dan Mousseau Chief Building Official City of Burlington
PANEL	Kenneth Peaker, Chair John Guthrie Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	February 28th, 2002
DATE OF RULING	February 28th, 2002
APPEARANCES	Dr. J. MacRae **The Applicant** Brad Swainsbury, Building Inspector City of Burlington **Designate for the Respondent**

RULING

1. The Applicant

Dr. J. MacRae, owner, Burlington, has received an order to comply under the *Building Code Act*, S.O. 1992, c. 23, as amended, to remedy certain alleged deficiencies in respect to interior alterations in a doctor's office building at the 777 Guelph Line, Suites 201 and 212, Burlington, Ontario.

2. Description of Construction

The Applicant has undertaken renovations to two joined suites located within a retail mall having a Group E occupancy. The building itself is two storeys in height and comprised of noncombustible construction. It is equipped with a sprinkler system, fire alarm system and a standpipe and hose system. The two units subject to this dispute occupy an area of 278.21 m^2 (3000 ft^2) and operate as a medical office.

The construction in dispute involves two sound proof booths for use in the testing of patient's hearing. Despite the sound proof nature of the areas, no visual signal devices to supplement the fire alarm audible signal are proposed. Reasoning for this includes the assertion that the auditory integrity of the sound proof nature of the booths will be compromised by the addition of signalling devices. In lieu of visual signals the Applicant is proposing direct supervision of patients at all times by qualified staff of the facility.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed direct supervision of patients in lieu of visual signalling devices will provide sufficiency of compliance with Sentences 3.2.4.19.(7) and 3.2.4.20.(1) of the Ontario Building Code (OBC).

Sentence 3.2.4.19.(7) requires that a fire alarm audible signal shall be supplemented by visual signal devices where, among other things, the occupants of a floor area are located within an audiometric booth or sound insulated enclosures. Furthermore, Sentence 3.2.4.20.(1) stipulates that such a required visual signal devise is to be installed so that the signal from at least one device is visible throughout the floor area or portion thereof in which they are installed.

In regard to the subject construction, the sound proof booths associated with this dispute would trigger the OBC requirement for the provision of visual signals to supplement the fire alarm system. In lieu of providing a visual signal device it is proposed that patients will be directly supervised at all times by trained staff.

4. Provisions of the Ontario Building Code

3.2.4.19. Audibility of Alarm Systems

(7) Fire alarm audible signal devices shall be supplemented by visual signal devices in any *floor area* in which

(a) the ambient noise level is more than 87 dBA, or

(b) the occupants of the *floor area*

(i) use ear protective devices,
(ii) are located within an audiometric booth, or
(iii) are located within sound insulated enclosures.

3.2.4.20. Visual Signals

(1) Visual signal devices required by Sentences 3.2.4.18.(4) and 3.2.4.19.(7) and (8) shall be installed so that the signal from at least one device is visible throughout the *floor area* or portion thereof in which they are installed. (See Appendix A.)

5. Applicant's Position

The Applicant provided the Commission with an understanding of the function of the sound booths in question. He submitted that the booths are used to test a patient's hearing. As such, the Applicant emphasized the importance of maintaining the acoustic integrity of these areas. He suggested that this integrity had already been compromised as a result of the requirement to sprinkler the booths. Any further penetration for a visual signal device, he argued, would affect the results of the testing being conducted.

As an additional argument, the Applicant submitted that many of the patients for whom the booths are employed are not only hearing impaired but visually impaired as well. Visual signals would be no more effective for them than the audible signal. In addition, children are also tested in the subject booths. In all cases, regardless of the abilities of the patient, direct supervision of the patient for whom the sound booth is used occurs at all times within the facility. Individuals inside the booths, he submitted, are never left alone. In addition, the doors to the booths are never closed unless they are in use. No one would be inside without supervision.

The Applicant further submitted that the decision not to provide the required visual signals in this instance is a matter of principal. In his opinion, the direct supervision of patients is superior to the visual strobe that would be required by the Building Code. Individuals inside the booths would be immediately alerted of a fire alarm signal by their attendant. In fact, he argued, the visual signal device could be considered a fallible system in that it would go unrecognized by the visually impaired.

When questioned about locating the visual signal outside the booth in an area that could be viewed through the window the Applicant advised that a person may not be able to see a set point outside the booth from all areas inside. He was uncertain whether the municipality would accept that solution but suggested that it would be a more acceptable alternative if required.

In summation, the Applicant stated that the doctors and staff on site receive fire safety training every year. He emphasized that they would know how to respond in the event of an alarm and would take the appropriate action to ensure that patient safety was never jeopardized.

Respondent's Position

The Designate for the Respondent submitted that the provisions in the Building Code are quite clear. Where booths such as these are used, a visual signal device is required to supplement the fire alarm auditory system. The purpose of this provision in the Code, he argued, is to alert those inside the sound proof area of the activation of the fire alarm. He suggested that, if there was a way to situate the device outside the booth so that it would be visual to those inside, he may be able to accept that

arrangement. However, he was unable to accept the assertion that direct patient supervision was adequate compensation for the passive visual signal. It would require individuals to take action to alert those inside the booths. The actions of individuals may be unpredictable during an emergency situation.

In summation the Designate submitted that, regardless of his reservations about direct supervision in lieu of visual signals, the Code requires the installation of supplementary devices and he is not able to accept the proposed alternative.

7. Commission Ruling

It is the decision of the Building Code Commission that the direct supervision of patients at all times in lieu of providing visual signal devices where sound booths will be used does not provide sufficiency of compliance with Sentences 3.2.4.19.(7) and 3.2.4.20.(1) of the Ontario Building Code at 777 Guelph Line, Suites 201 and 212, Burlington, Ontario.

8. Reasons

i) The direct supervision of patients does not offer sufficient compensation for the required visual signal devices.

ii) The visual signal devices are part of the automatic fire alarm system whereas supervision anticipates individual action on the part of those responsible. This action may be delayed and/or unpredictable.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24(1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Sentence 8.2.1.6.(2) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99, 205/00 and 283/01 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Dale and Chris Hewat, owners, for the resolution of a dispute with Rick Cole, Chief Building Official, Municipality of Grey Highlands, Ontario, to determine whether the proposed sewage system with a portion of the distribution pipes located approximately 1 m to 2.2 m from the support posts of a proposed deck, provides sufficiency of compliance with Sentence 8.2.1.6.(2) of the Ontario Building Code at 232 Peter's Crescent., Lake Eugenia, Municipality of Grey Highlands, Ontario.

APPLICANT	Dale and Chris Hewat Property owners
RESPONDENT	Rick Cole Chief Building Official Municipality of Grey Highlands
PANEL	Bryan Whitehead, Chair
PLACE	Toronto, Ontario
DATE OF HEARING	September 13, 2000
DATE OF RULING	September 13, 2000
APPEARANCES	Lloyd Hunt Architect **Agent for the Applicants** Rick Cole Chief Building Official Municipality of Grey Highlands **The Respondent**

RULING

1. The Applicant

Dale and Chris Hewat, property owners, have applied for a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and are proposing to construct a septic system and a deck at 232 Peter's Crescent, Lake Eugenia, Municipality of Grey Highlands.

2. Description of Construction

The Applicants are the owners of a residential property located on Lake Eugenia in the Municipality of Grey Highlands. They are currently constructing a single detached dwelling with a floor area of 2,730 ft^2 and having a total of 31 plumbing fixture units. The dwelling will be serviced by a drilled well on the property and a Class 4, shallow buried trench, sewage system, designed to accommodate a total daily design flow of 4500 litres per day. The soil conditions on site indicate a percolation time of 20 to 40 minutes per cm.

The construction in dispute involves the proximity of the proposed septic system in relation to the proposed second storey deck at the rear of the building, over looking the lake. Given the size of the dwelling under construction and the municipal setback requirements, the Applicant's are constrained in terms of locating the deck in relation to the proposed septic system. In this regard, while the main dwelling is situated the requisite 5 m from the system, the support posts of the proposed deck, however, will come to within 1 m of a portion of the distribution pipes in the filter bed. As compensation for this perceived deficiency, the Applicants are offering a total of 67 m of distribution pipe in four runs. The Code requires only 36 metres of pipe in this instance.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the subject support posts, with approximately 1 m to 2.2 m of clearance from a portion of the distribution pipes in the filter bed of the proposed septic system, provides sufficiency of compliance with Sentence 8.2.6.1.(2) of the Ontario Building Code (OBC).

The provisions outlined in this Sentence of the OBC require a clearance distance of 5 m between a structure and a distribution pipe. In this instance the clearance to the main building would meet this requirement, however, a portion of the distribution pipe would be within 1 m to 2.2 m of the proposed deck support posts. As a measure to compensate for this reduction in separation distance, the Applicants are proposing to provide surplus distribution pipe that would exceed the minimum length required by the Building Code.

4. Provisions of the Ontario Building Code

Sentence 8.2.1.6.(2) Clearances for a Class 4 or 5 Sewage System

(2) Except as provided in Sentences 8.2.1.4.(1) and (2) a *distribution pipe* shall not be located closer than the minimum horizontal distances set out in Table 8.2.1.6.B. and these distances shall be increased when required by Sentence 8.74.2.(9)

5. Applicant's Position

The Applicant's Agent advised that in designing the deck in relation to the proposed septic system he has been constrained by a very tight building envelope. He has tried to maximize the potential for the deck while acknowledging the importance of protecting the integrity of the proposed septic system. He submitted that the main building meets the setback requirements set out in the Code and only the support posts fail to maintain the required 5 m setback from a portion of the distribution pipe.

In reviewing the proposed design, and after alteration to the design of the deck, the Agent submitted a proposal aimed to compensate for the deficiency in this setback. He advised that 4 runs of pipe at 16.75 metres each for a total of 67 metres could be accommodated on site. In this regard, he submitted, the proposal would provide 1.8 times more length of distribution pipe than the minimum design length required by the Code. While he acknowledged that the surplus length of pipe may be shaded by the deck, his position was that the excess pipe would permit the septic system to work efficiently and without incident. The pipe, he argues, would still be effective by absorption.

In summation, the Agent emphasized that the Applicants do not want to compromise the safety of their septic system. He submitted that with the excess length of pipe, performance of the system would not be jeopardized in any way.

6. Respondent's Position

The Respondent submitted that the proposed deck is considered to be a structure for the purposes of determining setback requirements from any element of a septic system. In this regard, the support posts would not meet the 5 m clearance distance from the proposed distribution pipe.

He acknowledged the site constraint facing the Applicants and confirmed the municipal by-law requirement to maintain a 30 m setback from the high water mark of Lake Eugenia. He submitted, however, that the Applicants were aware of these requirements prior to purchasing the property. They had initially submitted building plans that included the second floor deck and projecting roof but were refused a permit because that proposal did not comply. A permit was eventually issued for the dwelling only.

In summation, the Respondent acknowledged the additional absorption to be provided by the excess lines of distribution pipe found in the Applicant's revised proposal. He maintained that, despite this compensation, the minimum clearance distance was still not achieved.

7. Commission Ruling

It is the decision of the Building Code Commission that the separation distance ranging from 1.0 m to 2.2 m between a portion of the proposed shallow buried trenches and the proposed deck and support posts provides sufficiency of compliance with Sentence 8.2.6.1.(2) of the Ontario Building Code at 232 Peter's Crescent, Lake Eugenia, in the Municipality of Grey Highlands, Ontario on condition that:

a) The distribution to the chambers will be by two forcemains and two headers with valves to each header to allow adjustment to the flow in the event that the shading of the west area has an impact on the infiltration/uptake of effluent.

8. Reasons

i) The applicant has demonstrated that a shallow buried trench system can be constructed on the eastern portion of the site to meet the minimum requirements of the OBC with respect to the setback to the basement of the building and the property line.

ii) The proposed additional trenches on the western portion of the site, which are in excess of the minimum length requirements, are closer to the support posts and overhanging deck than permitted by the OBC (5.0 metres), as the deck and posts are considered to be structures. Although the additional trenches may be compromised by the shadowing effect of the deck, with implementation of the condition imposed, the trenches and the deck supports can be constructed without negative impacts on performance.

iii) The proposed additional trenches will add to the performance of the system.

Dated at Toronto this **13th** day in the month of **September** in the year **2001** for application number **2001-50**.

RULING

1. The Applicant

Lyle and Rebecca Downey, property owners, Nestleton, Ontario, have applied for a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and have installed a new holding tank to serve a proposed granny flat at 4054 Mabels Road, (Nestleton), Township of Scugog, Ontario.

2. Description of Construction

The Applicant is proposing to convert an existing 39.02 m^2 (420 sq ft) boat-house into a granny flat intended for occupancy as a one storey, Group C dwelling unit. The building is located on the subject property adjacent to an existing house/cottage. The existing house is currently served by a Class 5, 10,910 L (2,400 gal) holding tank situated at the front of the property and located approximately 4.57 m (15 ft) from an existing well.

According to the Applicant's Agent, the boat house is currently a vacant shell of a building with all fixtures removed. When fully converted to a granny flat, the unit will have a maximum of 10 plumbing fixture units and a total daily design flow of 750 litres per day. In anticipation of the occupancy of this dwelling unit, the Applicant has installed an additional Class 5 holding tank, at the front of the property, having a 9,000 L (2,000 gal) capacity. The new holding tank is the subject of this dispute in as much as it has been located approximately 7 m (20 ft) from the existing well.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the newly installed Class 5 holding tank which is located approximately 7 m (20 ft) from the existing well, provides sufficiency of compliance with Sentence 8.2.1.6.(3) and Table 8.2.1.6.C. of the Ontario Building Code.

Sentence 8.2.1.6.(3) provides that a holding tank shall be located no closer than the minimum horizontal distances set out in Table 8.2.1.6.C. With respect to the distance required between a holding tank and a well, Table 8.2.1.6.C. provides a minimum distance separation of 15 m. In this instance, the new holding tank is located approximately 7 m from the well on the subject property.

It should also be noted that Article 8.8.1.2. outlines the parameters under which a Class 5 sewage system may be installed. Sentence (1) of this Article provides for installation of this type of system in certain circumstances including :

a) as a temporary measure, excluding seasonal recreational uses not exceeding 12 months,
b) to permit the expansion of an existing single family dwelling where the expansion will not increase the wastewater load and the building is already served by a Class 5 system,
c) to remedy an unsafe system where remediation by way of a Class 4 system is impractical, d) to upgrade an existing system where it would not be possible to do so with a Class 4 system because of site constraints, and
e) as an interim measure to serve a lot where municipal services are expected to be available in the near future.

In this instance, the proposed granny flat does not appear to fall within any of the circumstances where a Class 5 system would be permitted. It is an existing building on the lot that is being converted into habitable space.

4. Provisions of the Ontario Building Code

Sentence 8.2.1.6. Clearances for a Class 4 or 5 Sewage System

(3) Except as provided in Sentences 8.2.1.4.(1) and (2), a *holding tank* shall not be located closer than the minimum horizontal distances set out in Table 8.2.1.6.C.

Table 8.2.1.6.C.
Minimum Clearances for Holding Tanks
Forming part of Sentence 8.2.1.6.(3)

Structure	1.5 m
Well with a watertight casing to a depth of at least 6 m	15 m
Any other well	15 m
A spring	15 m
Property Line	3 m
Column 1	2

5. Applicant's Position

The Applicant's Agent advised that he is a licensed installer who was requested by the property owners to install a new 2,000 gallon holding tank on the subject property for the purpose of servicing a proposed granny flat. The property, he noted, is located on Lake Scugog and contains an existing boat-house that is presently vacant. The Agent advised that, at one time, the boat-house was equipped with a toilet and, as a result, he is hoping that Part 11 of the Code may apply in this instance.

He noted that there is a slightly larger holding tank already in existence on the property. This tank is located approximately 15 feet from the well and serves the house / cottage that is occupied by his clients. He submitted that the new tank, as installed, is farther away from the well than the existing tank and will create no greater impact than already exists.

6. Respondent's Position

The Respondent submitted that, after they had learned of the installation, an inspection was conducted and a building permit subsequently applied for. Upon inspection, it was noted that the new holding tank had been located approximately 7 m (20 ft) from the existing well. It is his position that this clearly does not meet the parameters set out in the Code which require a minimum separation distance of 15 m between holding tank and the well.

.

The Respondent recognized that the older tank was located closer to the well than the new one. He suggested Part 11 would apply in a situation where the new tank had been installed to replace a malfunctioning older one, as long as the performance level had not been reduced. That, however, is not the case here. The original system is not malfunctioning and the new tank has been added to serve a new dwelling unit, still to be created on the subject lot. This is a unit that, when combined with the total daily design flow of the existing cottage, would exceed the capacity of the existing holding tank.

In summation he concluded that, while he may be sympathetic to the constraints placed on the Applicants, his hands are tied by the Code requirements and, in this case the installation does not meet the setback requirements imposed.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-installed holding tank servicing the boat-house fails to provide sufficiency of compliance with Sentence 8.2.1.6.(3) of the Ontario Building Code at 4054 Mabels Road, (Nestleton), Township of Scugog, Ontario.

8. Reasons

i) The boathouse fails to meet the conditions for permitted installation of a holding tank outlined in Sentence 8.8.1.2.(1) of the Ontario Building Code. The proposed granny flat is essentially a new dwelling unit on the subject property.

ii) The holding tank does not meet the minimum distance separation outlined in the Code and no compensating measures were offered in lieu of compliance.

Dated at Toronto this **13th** day in the month of **September** in the year **2001** for application number **2001-44**.

Mr. Bryan Whitehead,Chair

Ruling No. 01-40-833
Application # 2001-49

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Articles 9.5.2.1., 3.8.1.1., 3.8.1.2. and 3.8.2.3. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Vivek Ananbarajah, Property Manager, York Condominium Corporation No. 42, Etobicoke, Ontario, for the resolution of a dispute with Ms. Paula Dill, Chief Building Official, City of Toronto, Ontario, to determine whether the proposed security gate house, that has not been designed for barrier-free access, provides sufficiency of compliance with Articles 9.5.2.1., 3.8.1.1., 3.8.1.2. and 3.8.2.3. of the Ontario Building Code at York Condominium No. 42, 330 Dixon Road, Suite 100, Toronto, Ontario.

APPLICANT	Mr. Vivek Ananbarajah, Property Manager York Condominium Corporation No. 42 Etobicoke, Ontario
RESPONDENT	Ms. Paula Dill Chief Building Official City of Toronto
PANEL	Mr. Len King, Chair (Designate) Mr. John Guthrie Mr. Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	August 30, 2001
DATE OF RULING	August 30, 2001
APPEARANCES	Mr. Michael Tindale Gerald R. Genge Building Consultants Inc. Sutton West, Ontario **Agent for the Applicant** Mr. Philip Ho Building Engineer City of Toronto **Designate for the Respondent**

RULING

1. The Applicant

Mr. Vivek Ananbarajah, Property Manager, York Condominium Corporation No.42, Etobicoke, Ontario, has received a building permit under the Building Code Act, 1992 and the process of constructing a security gate house at, 330 Dixon Road, Toronto, Ontario.

2. Description of Construction

The Applicant is constructing a building, referred to as a security gate house, having a building area of 18.58 m2. The structure has a Group D occupancy classification. It is one storey in building height and comprised of combustible construction. It will not be equipped with either a sprinkler system, a fire alarm system or a standpipe and hose system.

The security gate house is situated at the entrance to a residential condominium building and will house employees whose primary function will be monitor vehicular traffic into the development. There are generally one or two individuals on duty in the gate house at any given time. Accommodations within the gate house include desks and chairs for the employees, a storage closet and a two piece washroom.

The construction in dispute involves the design of the building entrance and the washroom facility. The entrance doorway on the plans submitted for approval has a width of 914 mm (3 ft), with one step from the finished grade into the building. The washroom facility provides a 658 mm (2.16 ft) wide entrance with a total room area of 1.88 m^2 (20.25 sq ft), having a length of 2,057 mm (6.75 ft) and a width of 914 mm (3 ft). Neither the parameters of the building entrance nor the dimensions of the washroom meet the Code requirements for barrier-free access.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed security gate house provides sufficiency of compliance with Articles 9.5.2.1., 3.8.1.1., 3.8.1.2. and 3.8.2.3. of the Ontario Building Code (OBC), in respect of the requirements for barrier-free access.

The building in question is to be constructed in accordance with Part 9 of the OBC. Article 9.5.2.1., specifically dealing with barrier-free design, requires that (with exceptions not applicable here) every building must be designed in accordance with Section 3.8.

Article 3.8.1.1. mandates that the provisions for barrier-free design be applied to all buildings with the exception of houses, buildings having a Group F, Division 1 major occupancy and buildings that are not occupied on a daily or full time basis. The security gate house in question does not fall within the scope of any of these specific exemptions.

Article 3.8.1.2. identifies the requirements for entrances to a barrier-free structure. The Code provisions in this regard require that, where there are one to three pedestrian entrances into a building, one entrance must be designed to provide barrier-free access. This design must conform to the requirements of Article 3.8.3.3. of the Code. The subject building contains one pedestrian entrance door for employee use only. The entrance, however, has not been designed to permit barrier-free access.

As a further requirement in the provision of barrier-free access within a building, Article 3.8.2.3. stipulates that a barrier-free washroom must be provided wherever a washroom is required. The design of the barrier-free washroom must comply with the provisions set out in the Code. Furthermore, Sentence (2) of Article 3.8.2.3. requires that, when a washroom is provided in excess of those required by Subsection 3.7.4., these washrooms shall also be designed to accommodate disabled persons. Sentence (3) of Article 3.8.2.3. outlines situations where a building would be exempt from the requirements of Sentence (2). None of these exemptions would appear to apply to the building in question and, as previously noted, the washroom has not been designed to provide barrier-free access.

4. Provisions of the Ontario Building Code

9.5.2.1. Barrier-Free Design General

(1) Except as provided in Sentence (2) and Article 3.8.1.1., every *building* shall be designed in conformance with Section 3.8.

(2) The requirements of Section 3.8. need not be provided for houses including semi-detached houses, duplexes, triplexes, town houses, row houses and *boarding, or rooming houses* with fewer than 8 boarders or roomers.

3.8.1.1. Application (See Appendix A.)

(1) The requirements of this Section apply to all *buildings* except

(a) houses, including semi-detached houses, duplexes, triplexes, town houses, row houses and boarding or rooming houses with fewer than 8 boarders or roomers,

(b) *buildings* of Group F, Division 1 *major occupancy*, and

(c) *buildings* which are not intended to be occupied on a daily or full time basis, including automatic telephone exchanges, pumphouses and substations.

3.8.1.2. Entrances (See Appendix A.)

(1) In addition to the *barrier-free* entrances required by Sentence (2), the number of *barrier-free* entrances in a *building* referred to in Sentence 3.8.1.1.(1) shall be not less than those as specified in Table 3.8.1.2. and shall lead from

(a) the outdoors at sidewalk level, or

(b) a ramp that conforms to Article 3.8.3.4. and leads from a sidewalk.

(2) A *suite* of *assembly occupancy, business and personal services occupancy* or *mercantile occupancy* that is located in the *first storey* of a *building* or in a *storey* to which a *barrier-free* path of travel is provided, and that is separated from the remainder of the *building*, so that there is no access to the remainder of the building, shall have at least one *barrier-free* entrance.

Table 3.8.1.2.
Minimum Number of Pedestrian Entrances Required to be Barrier-Free
Forming Part of Sentence 3.8.1.2.(1)

Number of pedestrian entrances into *building*	Minimum number of pedestrian entrances required to be *barrier-free*
1 to 3	1
more than 3 to 5	2
more than 5	not less than 50 percent
Column 1	2

(3) A *barrier-free* entrance required by Sentences (1) or (2) shall be designed in accordance with Article 3.8.3.3.

(4) At a *barrier-free* entrance that includes more than one doorway, only one of the doorways is required to be designed in accordance with the requirements of Article 3.8.3.3.

3.8.2.3. Washrooms Required to be Barrier-Free (See Appendix A.)

(1) Except where other *barrier-free* washrooms are provided on the same floor level within 45 m (147 ft 8 in) and except within *suites* of *residential occupancy*, and *buildings* exempted in Clauses 3.8.1.1.(1)(a), (b) and (c), in *buildings* where a washroom is required in accordance with Subsection 3.7.4., a *barrier-free* path of travel shall be provided to a *barrier-free* washroom designed to accommodate disabled persons in conformance with the appropriate requirements in Articles 3.8.3.8. to 3.8.3.12.

(2) Except as permitted in Sentence (3), where washrooms in excess of those required by Subsection 3.7.4. are provided in a *storey* to which a *barrier-free* path of travel is required in conformance with Article 3.8.2.1., these washrooms shall be designed to accommodate disabled persons in conformance with the appropriate requirements in Articles 3.8.3.8. to 3.8.3.12.

(3) Washrooms need not conform to the requirements in Sentence (2) provided
(a) they are located within *suites* of *residential occupancy*,
(b) other *barrier-free* washrooms are provided on the same floor level within 45 m (147 ft 8 in), or
(c) they are located in an individual *suite* having an area of less than 300 m^2 (3,230 ft^2) in *buildings* where such *suite* is completely cut off from the remainder of the *building* so that there is no access to the remainder of the *building*.

5. Applicant's Position

The Agent for the Applicant advised that the gate house in dispute is one of three that serve a security function for the associated condominium complex. One gate house serves the entrance to each of the three high-rise towers. In order to access the development, visitors and service personnel are required to pass by a gate house. As a function of monitoring the incoming traffic, security personnel are required to move about the traffic lane and parking areas. The Agent also advised this is the third and final gate house to be built at this location. The same set of plans has been used for this building as for the other two, which were approved by the municipality.

The Agent acknowledged that there was no specific reference in the Building Code that would exempt a security gate house from providing barrier-free access. He submitted, however, that Appendix 3.8.1.1. suggests that it would be reasonable to exempt a building from the barrier-free provisions where a handicapped person would not be expected to perform a particular duty because of the hazards associated with the business. In this situation, given the need for security staff to patrol the traffic lanes and parking area of the complex, the agent stated that it would be appropriate to waive the barrier-free requirements. The area would not be safe for a wheelchair-bound individual. He suggested that travelling through and around the traffic lane and parking area could be a significant hazard. It is the Agent's position that it would be unreasonable to require barrier-free access to the security gate house, given the role and expectations placed on the employees. In light of the hazards involved, it was his opinion that the building could be classified as a Group F, Division 2 industrial occupancy.

He stated that, while the gate house serves some remedial office functions, it is not intended to be used as an office as such. It functions primarily as a shelter for the one or two employees posted at the gate to monitor traffic and act in a security capacity. It was the Applicant's intention in this regard to provide more than just a kiosk for this purpose. They determined it to be desirable to heat the structure and provide a washroom for the use of the employees. As a further argument, the Agent submitted that the building itself would not be open to the public.

In summation, the Agent reiterated that if there was no justification in providing this building barrier-free access. The role and function of the security staff is such that it would not be appropriate to employ a handicapped individual. In addition, the path of travel leading up to the entrance of the building could be considered hazardous, thereby creating an exemption situation for barrier-free access. He submitted that it would be unreasonable to provide barrier-free access and, therefore, the cost could not be warranted in this situation.

6. Respondent's Position

The Designate for the Respondent submitted that the proposed gate house has been designed to accommodate security personnel. The building is used on a full-time, daily basis and serves an office function. There are desks and phones shown on the plans that would support a Group D - office classification. As a result, barrier-free access is required into and throughout the building.

The Designate noted that Article 9.5.2.1. exempts certain buildings from the barrier-free requirements, however, a security gate house is not one of them. The building, therefore, must be designed in accordance with Section 3.8., specifically, the requirements to provide a barrier-free entrance, path of travel and washroom facilities. The design of the building does not incorporate any of the access requirements outlined in the Code.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed security gate house that is not designed for barrier-free access does not provide sufficiency of compliance with Articles 9.5.2.1., 3.8.1.1., 3.8.1.2. and 3.8.2.3. of the Ontario Building Code at York Condominium No. 42, 330 Dixon Road, Suite 100, Toronto, Ontario.

8. Reasons

i) The gate house is a building and therefore required to provide barrier-free access.
ii) No compensating measures were offered in lieu of compliance with the Code.
iii) There are no extenuating circumstances to warrant waiving the OBC requirements.

DATE OF HEARING	August 30, 2001
DATE OF RULING	August 30, 2001
APPEARANCES	Mr. Chris Hawkswell Niacon Ltd. Niagara Falls, Ontario **Agent for the Applicant** Mr. Robert Romanuk Building & Inspections Coordinator City of Niagara Falls **Designate for the Respondent**

RULING

1. The Applicant

Joe DiCosimo, owner, 876891 Ontario Ltd., Niagara Falls, Ontario, has received a building permit under the Building Code Act, 1992 and has undertaken renovations at the Hilton Niagara, 6361 Buchanan Avenue, Niagara Falls, Ontario.

2. Description of Construction

The Hilton Niagara is a 33 storey hotel having a building area of 5,172 m^2. The use is classified as a Group C major occupancy and the building is equipped with fire alarm, sprinkler and standpipe and hose systems.

The Applicant has recently undertaken renovations to the structure which includes the construction of an interconnected floor area. The construction in dispute involves the height of the guard that has been installed in this area. The guard has been installed on the third floor of the building and the distance between floor levels is 6.5 m. The third floor primarily houses meeting room facilities and there are no guest suites on this level.

The disputed guard that has been constructed is comprised of a handmade glass rail atop a tempered glass balustrade. The handrail is secured to the balustrade with an epoxy. The guard runs around the third floor mezzanine area and proceeds down a grand stair to the first floor lobby. The height of the subject guard ranges between 1,040 mm and 1,055 mm above the finished floor.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the subject guard, constructed approximately 15 mm to 30 mm less than the required 1,070 mm height, provides sufficiency of compliance with Sentence 3.3.1.17.(1) of the Ontario Building Code.

The Code requirements in Sentence 3.3.1.17.(1) provide that, with the exception of certain circumstances not applicable here, a guard of not less than 1,070 mm will be provided at each raised floor, mezzanine balcony, etc., where the difference in floor level is more than 600 mm.

In this instance, the third floor opening requires that a guard be provided as the difference in floor levels is 6.5 m. The height of the guard is mandated by the Code at 1,070 mm. However, a guard ranging from 1,040 mm to 1,055 mm has been provided at this level.

4. Provisions of the Ontario Building Code

3.3.1.17. Guards

(1) Except for the front edges of *stages*, floor pits in repair garages and loading docks, a *guard* not less than 1 070 mm (3 ft 6 in) high shall be provided

(a) around each roof to which access is provided for other than maintenance,

(b) at openings into smoke shafts referred to in Subsection 3.2.6. that are

less than 1 070 mm
(3 ft 6 in) above the floor, and

(c) at each raised floor, *mezzanine*, balcony, gallery, interior or exterior vehicular ramp, and at other locations where the difference in level is more than 600 mm (23e in).

5. Applicant's Position

The Agent for the Applicant submitted that the handrail and associated glass balustrade are considered a major architectural feature of the mezzanine at the third level of the hotel. The architectural drawings submitted in connection with this application specified a guard that would have met the Building Code height requirement. Unfortunately, the guard was installed at a height less than what was intended. This discrepancy was not identified until the guard was almost completed.

The Agent advised that, because of the material used in the installation of the guard, it would be virtually impossible to remove the handrail from the glass guard. The rail itself is a handmade, blown glass feature that has been secured to the glass guard with a potent epoxy. The guard assembly was an expensive item to install and would be equally expensive to redo at this point. The Agent advised that he had considered options that would achieve compliance but, to change the handrail, or add height to it in some way, would take away from the "clean line" of the feature. Alternatives that had been explored were not aesthetically pleasing. The Agent suggested that the existing guard height represents only a slight variation from the Code requirement. He requested that the Commission consider making a ruling of sufficiency of compliance in this regard in light of this marginal difference.

The Agent and the Applicants architect were of the opinion that the discrepancy in guard height would pose no added danger to any person using the third floor area. They submitted that the height requirement in the Code was calculated to approximate the waist height of an average adult with the intent of this provision being to prevent a fall. The existing guard, varying only slightly from the requirement, meets the intent of the OBC in this regard. Safety, it was argued, would not be compromised with a shortfall of approximately one inch.

6. Respondent's Position

The Respondent submitted that, upon inspection of the floor area, it was discovered that the height of the guard did not meet the Code requirement of 1,070 mm. He is not especially concerned by the difference in height but his hands are tied by the Code provisions. He recognized that it was the Applicant's intent to have a Code compliant guard and that an error occurred in the execution of the architectural drawings. He reiterated, however, that anything less than 1,070 mm did not comply with the strict wording of the Building Code and, therefore, could not be approved by the municipality.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-installed guard, surrounding a 3rd floor opening, and being 15 to 30 mm lower in height than the required 1,070 mm, provides sufficiency of compliance with Sentence 3.3.1.17.(1) of the Ontario Building Code at the Hilton Niagara, 6361 Buchanan Avenue, Niagara Falls, Ontario.

8. Reasons

i) The height of the existing railing is only slightly lower than the required guard height.
ii) This is an as built condition that occurred as a result of an execution error by the installer.
iii) It would be difficult to remedy the situation at this stage of construction. The guard is not easily disassembled and replaced.

APPLICANT	Mr. Lawrence Carter Architecture Incorporated Waterloo, Ontario
RESPONDENT	Mr. Jim Witmer Chief Building Official Township of Wilmot, Ontario
PANEL	Dr. Kenneth Peaker, Chair Mr. Robert De Berardis Mr. Fred Barkhouse
PLACE	Toronto, Ontario
DATE OF HEARING	August 16th, 2001
DATE OF RULING	August 16th, 2001
APPEARANCES	Mr. Lawrence Carter Architecture Incorporated Waterloo, Ontario **The Applicant** Mr. Glen Good Acting Deputy Chief Building Official Township of Wilmot, Ontario **Designate for the Respondent**

RULING

1. The Applicant

Mr. Lawrence Carter, Architecture Incorporated, Waterloo, Ontario has applied for a building permit under the Building Code Act, 1992 and is proposing the construction of an addition at Hope Manor, R.R. #2, Petersburg, in the Township of Wilmot, Ontario.

2. Description of Construction

Hope Manor is a youth detention facility that was originally constructed in the 1960s. The building provides accommodation for boys and girls ranging in age from 12 to 15 years old. This is a maximum security operation for youth of this age. The facility is classified as a Group B, Division 1 major occupancy. The children are continually supervised and have no independent freedom of movement. In 1996, a major addition was constructed. The original building is comprised of combustible material whereas the 1996 addition is of noncombustible construction. The existing facility is two storeys in building height and has an area of approximately 600 m^2. The building is equipped with a fire alarm system. However, it is not provided with a sprinkler system.

Presently, the Applicant is proposing to construct a one storey, 82.15 m^2 classroom addition to the existing detention facility. This addition will replace the existing "portable" classroom, located some distance from the main building.

The construction in dispute centres on the new classroom addition and the current Building Code requirement for sprinklering of all Group B occupancies. The site is in a rural area and is not connected to municipal water service. In lieu of sprinklering the addition, it is proposed that the classroom will be fire separated from the remainder of the building by a 2 hour fire wall. This compartmentalization is not required by the Building Code. In addition, fire detection devices would be installed in the classroom area and connected to the fire alarm system for the rest of the building. Fire extinguishers, to be used by teachers in the classroom area would also be provided. Neither of these measures is required by the OBC.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the compensating measures offered in lieu of the required sprinklering of the proposed 82.15 m^2 classroom addition provide sufficiency of compliance with Article 3.2.2.37. of the Ontario Building Code (OBC).

Article 3.2.2.37. of the Code requires (with exceptions not applicable here) that a building having a Group B, Division 1 occupancy be of noncombustible construction and be equipped with a sprinkler system. The classroom addition proposed in this case is of noncombustible construction but is not intended to be sprinklered. In lieu of the requirement to sprinkler, and as noted above, a number of compensating measures are offered in an attempt to achieve sufficiency of compliance with the OBC requirements. In all other respects, the proposed addition will comply with the requisite conditions of the Article in dispute.

4. Provisions of the Ontario Building Code

Article 3.2.2.37. Group B, Division 1, up to 3 Storeys, Sprinklered

(1) A *building* classified as Group B, Division 1 is permitted to conform to Sentence (2) provided
- (a) except as permitted by Sentence 3.2.2.7.(1) the *building* is *sprinklered*,
- (b) it is not more than 3 *storeys* in *building height*, and
- (c) it has a *building area*
  - (i) that is not limited if the *building* is not more than 1 *storey* in *building height*,
  - (ii) not more than 12 000 m^2 (129,000 ft^2) if 2 *storeys* in *building height*, or
  - (iii) not more than 8 000 m^2 (86,100 ft^2) if 3 *storeys* in *building height*.

(2) Except as permitted by Article 3.2.2.16., the *building* referred to in Sentence (1) shall be of *noncombustible construction*, and
- (a) floor assemblies shall be *fire separations* with a *fire-resistance rating* not less than 1 h,
- (b) *mezzanines* shall have a *fire-resistance rating* not less than 1 h, and
- (c) *loadbearing* walls, columns and arches shall have a *fire-resistance rating* not less than that required for the supported assembly.

5. Applicant's Position

The Applicant submitted that Hope Manor, a highly regarded detention provider, is looking to construct an addition to their existing facility. He outlined the history of the site and advised that a classroom addition is proposed that will replace the existing portable classroom on site.

The Applicant continued by advising that the existing structure is not sprinklered and suggested that sprinklering the relatively small, noncombustible addition would not increase life safety for the occupants of the building. He described the nature of the operation and advised that the children detained at the facility are constantly supervised. There would always be a staff member present in the classroom whenever it was in use. This staff member would possess a key to unlock the exit doors in case of an emergency. He also advised that there is a two stage fire alarm system that would first alert staff to an alarm and then allow three minutes for a response. After the three minute interval, if the alarm is not disengaged, all of the doors are released to allow the evacuation of the building. In addition, he submitted that regular fire drills are conducted at the facility and evacuation generally occurs within 2 minutes.

The Applicant acknowledged the Code requirement for sprinklering in a B1 occupancy, but suggested that, because the property is not connected to the municipal water system, a significant portion of the budget would be required to sprinkler the addition. He is asking for relief with the consideration that the addition is relatively small in size and does not facilitate any increase to the occupant load (there area approximately 40 staff and residents of the facility). In addition, he suggested that the compensating measures he is willing to provide would adequately achieve sufficiency of compliance in this instance. By fire separating the addition and providing extra protection by way of additional fire detection devices and fire extinguishers, life safety would not be compromised.

When questioned about the current provision of water to the facility, the Applicant advised that there is a small pipeline that currently runs from the municipal system to a storage tank. The water is pressurised for use in the building. This line was installed back at the time of the original construction in the 1960s and runs across a neighbouring farm. The system provides adequate pressure for their

current needs but is not considered to be part of the municipal water supply. There is no guarantee that the required sprinklering could be installed using this line. A water storage tank would likely be required for any sprinklering of the building. Despite the size of the addition, a substantial tank would be required along with the operational pumps. This would cost approximately $50,000. The Applicant advised that the budget for the entire project was only $115,000.

In summation the Applicant stated that this is a fairly important addition from the standpoint of the facility operators. He reiterated the compensating measures offered in lieu of sprinklering and suggested that sufficiency of compliance can be achieved in this instance, especially when considering the small size of this noncombustible addition that would not increase the occupant load of the facility.

6. Respondent's Position

The Respondent submitted that sprinklering is a mandatory requirement of all B1 occupancy buildings. He acknowledged that Hope Manor has been a good municipal citizen and runs an excellent facility. He further recognized the challenge facing the Applicant with respect to an adequate water supply.

The Respondent suggested that an alternative may be to permit the Applicant to install fast response sprinkler heads that could feed off the domestic water supply available. He advised that, up until the time of the hearing, he was unaware of the small water pipeline running off the municipal system. To consider any option, however, he would need to verify the existing flow. The Respondent advised that he would like to work out a solution with the Applicant but his hands are tied by the OBC's requirements.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed 82.15 m^2 unsprinklered classroom addition to the existing unsprinklered detention occupancy does not provide sufficiency of compliance with Article 3.2.2.37. of the Ontario Building Code at Hope Manor, R.R. #2, Petersburg, Wilmot Township, Ontario.

8. Reasons

i) The compensatory measured offered in lieu of sprinklering are not adequate to achieve sufficiency of compliance.
ii) Sprinklering of the detention facility is an important and required life safety feature when considering the limited freedom of movement of the occupants.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Sentence 3.2.5.13.(1) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Stephen Bent, Director of Finance, Ottawa-Carleton Lifeskills Inc., Ottawa, Ontario, for the resolution of a dispute with Ms. Catherine Junop, Chief Building Official, City of Ottawa, Ontario, to determine whether the proposed sprinkler system, designed in conformance with NFPA 13, with the exception of the attic area which would conform to NFPA 13R (exempt from sprinklering), provides sufficiency of compliance with Sentence 3.2.5.13.(1) of the Ontario Building Code at the Ottawa-Carleton Lifeskills Group Home at 810 Ivanhoe Avenue, Ottawa, Ontario.

APPLICANT	Mr. Stephen Bent, Director of Finance Ottawa-Carleton Lifeskills Inc. Ottawa, Ontario
RESPONDENT	Ms. Catherine Junop Chief Building Official City of Ottawa
PANEL	Dr. Kenneth Peaker, Chair Mr. John Guthrie Mr. Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	August 2nd, 2001
DATE OF RULING	August 2nd, 2001
APPEARANCES	Mr. Leonard Koffman Leonard Koffman Architect Ottawa, Ontario **Agent for the Applicant** Mr. Luc Nadeau Part 3 Plan Examiner City of Ottawa **Designate for the Respondent**

RULING

1. The Applicant

Mr. Stephen Bent, Director of Finance, Ottawa-Carleton Lifeskills Inc., Ottawa, Ontario, has received a building permit under the Building Code Act, 1992 and is in the process of constructing the Ottawa-Carleton Lifeskills Group Home at 810 Ivanhoe Avenue, Ottawa, Ontario.

2. Description of Construction

The Applicant is currently constructing a one storey (with a full basement), group home with a building area of 453 m^2 that is intended to house up to 12 residents who would receive staff supervision 24 hours a day. The structure is built of combustible construction and is classified as having a Group B, Division 3 (care) occupancy. The structure will be equipped with a single stage fire alarm system and a sprinkler system.

The construction in dispute involves the design of the sprinkler system for the group home. Although it is proposed that the system for most of the building be designed in accordance with the NFPA 13 standard, it is also proposed that, in the attic area, the system installation would be in accordance with NFPA 13R, "Standard for the Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height." The relief requested in this instance is essentially to exempt the attic area from any sprinklering while still providing the required sprinklering on the ground floor.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the sprinkler design, constructed to the NFPA 13R standard in the attic area, achieves sufficiency of compliance with Sentence 3.2.5.13.(1) .

As outlined in Article 3.2.2.41., a B3 occupancy facility may comprised of combustible or noncombustible construction. Whichever material is used, however, the building must be sprinklered. The dispute here centres on the type of sprinkler system that is required in this instance. Sentence 3.2.5.13.(1) states that the sprinkler system must meet NFPA 13, while Sentence 3.2.5.13.(2), provides an exception to Sentence (1) by allowing low rise (four stories or less) residential occupancies to comply with the more relaxed sprinkler standards found in NFPA 13R.

The NFPA 13R standard stipulates that a sprinkler system must be designed and installed for all occupied rooms. The NFPA 13 standard, however, goes further by also requiring sprinklering in unoccupied areas such as closets and concealed spaces such as attics.

In this instance, it is proposed that the ground floor of the dwelling be equipped with a sprinkler system designed and installed in accordance with the NFPA 13 standard, however, it is proposed that the attic area be exempt from sprinklering in this instance. The dwelling, while designed to appear as a house-like structure, is classified as a Group B, Division 3 occupancy and does not meet the criteria for the exemption permitted to residential occupancies.

4. Provisions of the Ontario Building Code

3.2.5.13. Automatic Sprinkler Systems

(1) Except as permitted by Sentences (2), (3) and (4), an automatic sprinkler system shall be designed, constructed, installed and tested in conformance with NFPA 13, "Standard for the Installation of Sprinkler Systems". (See Appendix A.)

5. Applicant's Position

The Applicant described the operation of Ottawa-Carleton Life Skills as an organization that provides community living opportunities for developmentally challenged individuals. They provide a nurturing environment in a community setting.

The Applicant's Agent continued by advising that they are currently constructing a one storey, home-like building. He submitted that the building could be considered residential if there were to be less than 10 residents and where no more than two persons who would require assistance to evacuate the premises in the event of an emergency. He suggested that, in this case, they only marginally exceed this provision by accommodating up to 12 residents. If classified as residential, he argued, the sprinkler system could be designed in accordance with NFPA 13R.

The Agent also advised that the building is intended to comply, in all other respects, with the requirements for a B3 facility. This includes fire separations and sprinklering in the garage area in accordance with NFPA 13. He advised that the building is equipped with a single stage fire alarm system, smoke detectors and smoke alarms, CO_2 detectors and four exit doors on the ground floor. He advised that the travel distance to an exit would not exceed 40 ft. This, he argued, is far less distance than the OBC requires. In addition, he advised, there are two patio doors that could be used in an emergency.

The Applicant advised that there is a Fire Plan in place that outlines fire evacuation procedures and both scheduled and spontaneous fire drills are conducted with the residents. He estimates the approximate evacuation time to be from 2 to 4 minutes. The Agent advised that all 12 residents will be ambulatory individuals who respond well to verbal direction and commands.

The Applicant was originally seeking approval of an NFPA 13R system for the entire dwelling, but after contemplation of what this would mean for the design of the system and the areas to be sprinklered, decided that he would conform with NFPA 13 on the ground floor but was seeking relief from this requirement in the attic area only; here he was requesting an exemption from sprinklering. As a result of limited funding, the Applicant submitted, the money that would be used to sprinkler the attic could be better used to fund other ventures for the benefit of the occupants. As compensation for sprinklering in the attic, the Agent offered to install smoke detectors throughout the space at a rate of one detector for every 100 m^2. These detectors, they suggested, would serve as an early warning approach to activate the alarm system should a fire ignite in the attic.

6. Respondent's Position

The Respondent submitted that, while he recognizes the nature of this operation and the limited size of the dwelling, his hands are tied by the specific wording of the Building Code. In this instance, there is accommodation for greater than 10 individuals and the building must be considered as a B3

occupancy for the purposes of applying the OBC. In this regard, sprinklering is required in conformance with NFPA 13. He suggested that, while the building is no different from a typical residential dwelling, it is operating as a group home for 12 developmentally challenged individuals.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed sprinkler system in a B3 occupancy, designed in conformance with NFPA 13 with the exception of the attic area which would be designed in accordance with NFPA 13R (exempt from sprinklering), does not provide sufficiency of compliance with Sentence 3.2.5.13.(1) of the Ontario Building Code at the Ottawa-Carleton Lifeskills Inc. Group Home at 810 Ivanhoe Avenue, Ottawa, Ontario.

8. Reasons

i) The compensating measures offered do not achieve sufficiency of compliance with the OBC requirements.

ii) This B3 occupancy requires conformance with NFPA 13 and does not meet the parameters for exemption from this standard.

AND IN THE MATTER OF Article 3.4.4.4. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Ferdinand Regier, Chapman Murray Associates Architects Inc. for the resolution of a dispute with Mel Brown, Chief Building Official, City of Niagara Falls, to determine whether the exit stair, which contains an opening for an elevator that is proposed to have a pressurized elevator shaft, provides sufficiency of compliance with Article 3.4.4.4. of the Ontario Building Code at the Minolta Tower, Niagara Falls, Ontario.

APPLICANT	Ferdinand Regier Chapman Murray Associates Architects Inc. Niagara Falls, Ontario
RESPONDENT	Mel Brown Chief Building Official City of Niagara Falls
PANEL	Kenneth Peaker, Chair John Guthrie Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	August 2nd, 2001
DATE OF RULING	August 2nd, 2001
APPEARANCES	Rick Mori Leber/Rubes Inc. Toronto, Ontario **Agent for the Applicant**

RULING

1. The Applicant

Ferdinand Regier, Chapman Murray Associates Architects Inc., has applied for a building permit under the *Building Code Act*, S.O. 1992, c. 23, as amended, and is proposing renovations to the Minolta Tower in the City of Niagara Falls, Ontario.

2. Description of Construction

The Applicant is undertaking renovations to the Minolta Tower building, which has most recently been used as an observation tower with associated restaurant uses. The building is a 30 storey structure and will be classified as having Group C and Group A, Division 2 occupancies. The tower is of noncombustible construction and is partially sprinklered. In addition, the building is equipped with a fire alarm and a standpipe and hose system.

The building itself is a unique structure. The first floor of the structure is at grade level whereas the next accessible storey is located 64.62 m (212 ft) above ground on the 25th floor. There are currently two fire separated exit stairs, one that serves from grade level to the 26th floor and another that serves up to the 30th floor. In addition, there is also an open stair that leads from the 26th floor through to the 30th floor. The upper floors of the tower are also served by three elevators, equally spaced around the building's interior. One of the elevators runs from the basement level to the top of the tower. The other two are only accessed at ground level and progress to the upper storeys.

The renovations to the building will maintain the two levels of restaurant use on the 25th and 26th floors while the observation levels on floors 27 through 30 will be converted to hotel suites. In light of the alterations being undertaken, the open stair must now be considered as a required exit. As a result, this stair will be enclosed with a fire separation and will cross over and link with the exit stair that stops at the 26th floor. The construction in dispute involves the elevator opening that would be present within the egress route at this crossover location. In linking the two stairs for use as a required exit, and given the configuration of the building and location of the elevator openings in proximity to the exit stairs, the doors to one of the elevators lies between the two stairways and would be included within the enclosure.

The Applicant has proposed to pressurize the elevator shafts as a measure to compensate for the opening within the required exit. Pressurization in these areas would exceed the Code requirements in this building.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the exit stair, which would contain an opening for an elevator where it is proposed that the elevator shaft will be pressurized, provides sufficiency of compliance with Article 3.4.4.4. of the Ontario Building Code (OBC).

Article 3.4.4.4. outlines the provisions for ensuring that the integrity of exits is maintained. Sentence (1) of this Article provides that fire separations that separate an exit from the remainder of the building shall have no openings. There are several exceptions to this provision, none of which include a door to an elevator hoistway. Sentences (2) through (10) of Article 3.4.4.4. outline prohibitions on the use of an exit area and proscribe any openings, penetrations or appliances from being located within a required exit.

The renovations proposed for the building in dispute would include an elevator opening within the required exit area. However, as compensation for this penetration it is proposed that the building's elevators shafts will be pressurized. An analysis of the early warning and evacuation systems of the building under Part 11 of the OBC reveals that, in a sprinklered building, under Measurement A of the Supplemental Guidelines, the elevator shafts are not required to be pressurized. Given that this is an existing building, the anticipated renovations fall within these provisions of the Code.

4. Provisions of the Ontario Building Code

3.4.4.4. Integrity of Exits

(1) A *fire separation* that separates an *exit* from the remainder of the *building* shall have no openings except for

(a) standpipe and sprinkler piping,
(b) electrical wires and cables, totally enclosed *noncombustible* raceways and *noncombustible* piping that serve only the *exit*,
(c) openings required by the provisions of Subsection 3.2.6.,
(d) *exit* doorways, and
(e) wired glass and glass block permitted by Article 3.1.8.14.

(2) *Exits* within scissors stairs and other contiguous *exit* stairways shall be separated from each other by a smoke-tight *fire separation* having a *fire-resistance rating* not less than that required for the floor assembly through which they pass.

(3) *Fire separations* separating contiguous stairs described in Sentence (2) shall not be pierced by doorways, ductwork, piping or any other openings that affect the continuity of the separation.

(4) A fuel-fired *appliance* shall not be installed in an *exit*.

(5) An *exit* shall not be used as a *plenum* for a heating, ventilating or air-conditioning system.

(6) An *exit* shall be designed for no purpose other than for exiting, except that an *exit* is permitted also to be designed to serve as an access to a *floor area*.

(7) A *service room* shall not open directly into an *exit*.

(8) Storage rooms, washrooms, toilet rooms, laundry rooms and similar ancillary rooms shall not open directly into an *exit*.

(9) *Service spaces* referred to in Sentence 3.2.1.1.(7) shall not open directly into an *exit*.

(10) In elementary and secondary schools, an *exit* shall be designed so that it does not serve as an access from one portion of a *floor area* to another portion of the same *floor area*.

5. Applicant's Position

The Agent for the Applicant submitted that the Minolta Tower is a unique structure that was constructed prior to either the Ontario Building Code or the National Building Code. He described the structure as a long tower with a "goblet-like" top. There are presently two fire rated stairs in the tower; one running from the ground level to the 26th storey and the other running from ground level to the 30th

There is also an open stair that runs between floors 26 and 30. When originally constructed, these stairs were to serve the restaurants and observation decks at the top of the tower.

As part of the current renovations it has been a goal of the Applicant to make the building as Code compliant as possible. The second required exit stair that would serve the residential hotel suites must cross over at the 26th floor between stairwells. This area will be fire separated from the remainder of the floor area, however, an elevator opening is located within the proposed exit route between the two stairs. The Agent recognized that an elevator opening within a required exit space is not usually permitted but advised that the elevator in question is a prime elevator needed to access the restaurant uses on the 25th and 26th floors.

The Agent argued that, because of the spatial limitations within the tower, they had no other option than to include the elevator within the required exit route between the two stairwells. As a measure to compensate for this penetration, however, they are proposing to pressurize all of the elevator shafts. In their analysis of the building, and based on the renovations proposed, it was concluded that the hazard index would not be increased, therefore, pressurization would not be required. The compensating measure would, therefore, be in excess of the OBC requirements in this instance.

The Agent further submitted that a proposed Fire Safety Plan could address the issue of when pressurization of the elevator shaft would be warranted. He stated that, as a result of the change in major occupancy from an assembly use to residential hotel suites, there will be fewer people on the upper floors that would require evacuation in an emergency. In fact, he advised that the fire department anticipated that people would likely wait in their rooms for evacuation by fire department personnel.

In terms of the added value of pressurizing the elevator shaft, the Agent submitted that his research concluded that several literary sources supported the protection of an exit using pressurization. In addition, he argued that there is little possibility of a fire starting below the 26th floor. He also advised that the elevator cabs themselves are fairly fire resistant being comprised of a marble floor, steel ceiling and essentially noncombustible walls. He emphasized that most fires that start in elevators do not originate from the mechanical systems but from vandalism of the cabs.

In summation, the Agent submitted that in his opinion, pressurization of the elevator shaft would adequately maintain the integrity of the exit at this crossover location. He submitted that the shaft of the elevator is much larger than the cab and that pressurization would be quite effective. In addition, the elevators are all fully manned and can be recalled to the ground level if required. He stated that the elevator in question is required for patrons to access the restaurant levels. To remove the elevator opening on the 26th floor would pose a hardship for the restaurant operators.

6. Respondent's Position

The Respondent chose not to attend the hearing and as a result the Building Code Commission relied on his written submission only.

In his summarization of the dispute the Respondent advised that "(i)n accordance with 3.4.4.4. Integrity of Exits, an opening for an elevator shaft in an exit is not a listed exception." In this instance the exit stair at the 26th floor contains an elevator door opening to the shaft and cannot be accepted as code compliant by the municipality.

7. Commission Ruling

It is the decision of the Building Code Commission that the exit stair, which contains an opening for an

elevator that is proposed to have a pressurized elevator shaft, does not provide sufficiency of compliance with Article 3.4.4.4. of the Ontario Building Code at the Minolta Tower, Niagara Falls, Ontario.

8. Reasons

i) The integrity of the required exit is compromised by the elevator opening.

ii) The proposed compensating measure, while making the elevator safer, does not adequately address the problem of the exit's integrity.

Dated at Toronto this **2nd** day in the month of **August** in the year **2001** for application number **2001-40** .

APPLICANT	Mrs. Eija Lukkarinen, Owner 5 Ennismore Place Willowdale, Ontario
RESPONDENT	Mr. Ted Tipping Deputy Chief Building Official City of Toronto
PANEL	Dr. Kenneth Peaker, Chair Mr. Michael Steele Mr. Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	July 19th, 2001
DATE OF RULING	July 19th, 2001
APPEARANCES	Mrs. Eija Lukkarinen, Owner 5 Ennismore Place Willowdale, Ontario **The Applicant** Mr. Victor Araujo Senior Plans Examiner City of Toronto **Designate for the Respondent**

RULING

1. The Applicant

Mrs. Eija Lukkarinen, owner, Willowdale, Ontario, has applied for a building permit under the Building Code Act, 1992 and is proposing the construction of a Finnish-design heating unit in the basement of her dwelling at 5 Ennismore Place, Willowdale, Ontario.

2. Description of Construction

The Applicant is the owner of a single detached dwelling. The building is one storey in height, less than 600 m^2 in building area and is classified as having a Group C major occupancy. It is of combustible construction and is not equipped with a fire alarm system.

The construction in dispute involves a "fireplace" intended to be located in a basement recreation room within the dwelling. It should be noted at the outset, however, that the proposed Finnish-design "fireplace" is less of a conventional convection fireplace and is more akin to a heating unit or a masonry baking oven.[1] Indeed, the proposal is a unique masonry radiant heater that is substantially different from a typical fireplace anticipated by the Building Code. For example, the heater operates according to downdraft contraflow principles, not convection (see discussion below). The design also contains components not addressed in the Building Code such as the "steel by-pass channel", "smoke blade" and "cast re-factory slab". In addition, the heating unit and chimney are separate but connected items in a heater of Finnish design. Often the chimney is positioned behind the heating unit, but in this case it is proposed to be located to the right of the burning unit (when facing the heater).

In terms of construction specifics, both the proposed heater and chimney are to be situated on a footing having dimensions of 1,995 mm (78.5 in) wide, 1,500 mm (59 in) deep and 305 mm (12 in) thick. The footing will be made of poured concrete with 13 mm (½ in) rebar laid in a 305 mm (12 in) grid. The footing pad is to be built so that its top will be at the same height as the existing finished concrete floor. On top of the footing will be the heating unit and chimney. These will be positioned such that the footing will project 150 mm (6 in) outwards from the rear and sides of the heater and chimney. The front of the heater, however, will be set back 405 mm (16 in) from the front edge of the footing to allow space for the hearth.

The heating unit is to be constructed of masonry and will be 1,270 mm (50 in) wide, 940 mm (37 in) in depth and 1,930 mm (76 in) in height. A 205 mm (8 in) clearance will be maintained between the top of the burning unit and the underside of the ceiling. (The floor to ceiling height in the subject basement is 2,135 mm (84 in).) The rear of the heating unit will also be separated from the basement wall by a 150 mm (6 in) clearance. As well, the heater construction proposes a hearth to be situated directly on the footing projecting out 405 mm (16 in) from its face. The hearth will run the 1,270 mm (50 in) width of the heater and will be 305 mm (12 in) high. It too will be made of masonry, but will be a hollow structure topped with a noncombustible material that will act as the actual hearth surface.

The chimney unit is to be constructed directly on top of the footing as well and will be connected to

---

[1] Accordingly, this decision shall hereafter refer to the proposed construction as a heating unit or heater.

the top and bottom of the heater structure. The chimney will also be masonry construction and is to measure 405 mm (16 in) wide and 510 mm (20 in) in depth. It will extend up through the ground floor and roof of the dwelling to a height of 5 m above grade level. It will be topped with a solid concrete cap with a drip edge and is to be fitted with a clay liner. The chimney is to be separated from the burning unit by a 13 mm (½ in) clearance and from the rear basement wall by at least 150 mm (6 in). Further, as it travels up through the house, the chimney will be separated from the ground floor and roof assembly combustible framing members by 50 mm (2 in). The same 50 mm separation will be provided from the chimney to the nearest finished wall of the ground floor.

Within the heating unit, the construction will be as follows: The main portion of the firebox, or combustion chamber, will be 455 mm (18 in) wide, 595 mm (23 ½ in) in depth and approximately 510 mm (20 in) in height. Access to the firebox is through two hinged doors at the front of the heater unit. Above the actual combustion area is the smoke chamber. This is a flat, funnel-shaped space with front and rear corbelled masonry walls which taper together at a 60^0 angle from horizontal. This funnel-shaped area terminates at what is called the "throat", which is a 75 mm (3 in) narrow slit centred over the middle of the firebox. At 455 mm (18 in) in length, however, the throat is as wide as the firebox.

Above the throat is to be another chamber described as the "secondary combustion chamber" which is to be nearly as large as the lower firebox and smoke chamber together. The secondary chamber is proposed as a rectangular-shaped box except for the upper one quarter of its walls which are to angle inwards 60^0 from horizontal all the way around. The ceiling of this chamber is to be flat and will be capped with a removable "cast refractory slab" which, according to the Applicant, is a manufactured heat shield capable of withstanding the high temperatures that occur during secondary combustion. On top of this will be another removable concrete slab, although this one is to be made of standard material.

Proposed at the sides of the secondary combustion chamber are two narrow heat exchange channels both 89 mm (3 ½ in) wide and approximately 455 mm (18 in) in depth that are to travel downwards nearly to floor level and connect at the rear of the heating unit. The connection area of the two channels is, in turn, connected to the chimney at the right side. Within the secondary combustion chamber itself, these channels are both separated from the main area by a baffle. At the upper portion of the rear wall of this chamber is a second throat which leads to a bypass channel made of steel fitted and with a damper. This damper leads directly to the chimney (bypassing the heat exchange channels) and when open will allow heat and smoke to dissipate rapidly up the chimney similar to a conventional fireplace. This damper will also be opened when lighting the fire in the primary combustion chamber in order to expel carbon monoxide quickly through the unit. According to the Applicant, "(w)hen draft is established, the bypass damper is then closed and the heater goes into downdraft mode."

The purpose of the secondary combustion chamber is to manage the heat and smoke produced by the fire. Specifically, in this area the superheated gases will move to the top of the heater and as the heat builds it will then drop down into the heat exchange channels located on both sides. As the heated gases pass through these side channels heat will then be transferred to the exterior brick shell of the heating unit. The flue gases would then enter a common channel at the base of the heater and exit into the chimney flue. The intent of this design is to provide heat to the room/house for up to 24 hours after the burn is complete.

Supply air will be provided to the combustion chamber through two means. The primary air source will come from the ash pit located below the firebox. The ash pit door will have openable slats which will allow air to be drawn in, which can then pass up through the floor grating of the firebox

that separates the firebox from the ash pit. The secondary air supply source is provided by additional openable slats located in the base of the two hinged doors at the front of the firebox.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed Finnish heating unit provides sufficiency of compliance with Sections 9.21. and 9.22. of the Ontario Building Code (OBC). These Sections provide the construction requirements for chimneys and flues and fireplaces respectively.

The numerous standards found within OBC 9.21. and 9.22. are intended, however, to apply to and were developed specifically for conventional convection fireplaces. As noted above, the proposed "fireplace", or rather heating unit, performs significantly differently. Its purpose is not simply to act as a protective enclosure for the safe burning of solid fuel, instead its objective is to act as a facility for the purpose of slow diffusion thermal heating. As such, it not only protects the remainder of the building from the combustion occurring within, it also processes the heated gases and fumes so that heat is stored and dissipates over a period of time. Nevertheless, as a site-built, solid fuel heating unit, the proposed construction is also not covered by Part 6 of the OBC.

The Applicant's proposal thus falls outside the prescriptive requirements of the Ontario Building Code. In such appeals, it is necessary for the BCC to consider the application, as either an alternative or equivalent system to those envisage by Code. The Commission must do so on the basis of whether the proposal sufficiently complies with the *intent* of the technical requirements of the OBC, and not the actual prescriptive requirements themselves since, in this case, these are to apply to a different type of solid fuel burning unit. In doing this, the proposal, albeit different than an OBC-type fireplace, must be weighed on whether it provides the same minimum level of health and safety as that intended by the Code provisions in Sections 9.21. and 9.22.

In the present matter, the Commission considers that sufficiency of compliance can be achieved with OBC 9.21. and 9.22. if the proposal were to meet the American Society for Testing and Materials (ASTM) Standard E 1602-94, "Standard Guide for Construction of Solid Fuel Burning Masonry Heaters". This is a standard that specifically outlines construction requirements for site-built masonry heaters. It does not address conventional fireplaces. Its purpose is to provide requirements precisely for what the Applicant intends to build. Indeed, Finnish heaters are included as an example of the construction covered by ASTM E 1602-94.

The BCC has reviewed the ASTM E 1602-94 standard. The Commission has determined that, in this instance, ASTM E 1602-94 meets the same level of fire safety protection as that required by Sections 9.21. and 9.22. As a result, the BCC holds that it is an appropriate alternative standard to which the proposal may be compared in an effort to determine its sufficiency of compliance.

4. Provisions of the Ontario Building Code

9.21. Chimneys and Flues

See provisions in the Ontario Building Code.

9.22. Fireplaces

See provisions in the Ontario Building Code.

5. Applicant's Position

The Applicant initiated her discussion with an outline of the road blocks she has encountered since her building permit application was presented to the City. She advised that she has spoken with several staff members and returned to the City on a number of occasions with additional information that would support her proposal. She emphasized the unwillingness of City staff to fully review or consider her proposal and expressed her frustration with the process to date. She submitted that the City, rather than reviewing the information she presented, which included three books authored on the design and construction of a Finnish heater, took the position that she would require an engineered design in order to obtain approval. In this regard, she further advised that both she and the mason she has retained for this project had contacted a number of engineers but none would review her heating unit plans or take on the project.

In support of her proposal, the Applicant advised that the Finnish heater design is recognized worldwide as an effective and efficient system. As well, Tampire University in Finland has published a study attesting to its performance. She advised the Commission that, in her opinion, all aspects of the Ontario Building Code would be adequately complied with except for the angle of the flue incline and the smoke chamber slope. For these areas, she stated, it was simply not possible to comply because such slopes are essential for the downdraft functioning of the unit. She submitted, however, that the performance history of the Finnish heater and the manuals presented as evidence should be satisfactory to ensure sufficiency of compliance with the intent of the Code. In addition, she offered to have the system tested, if necessary, by the Tulikivi Lab in Mississauga, specialists in this type of masonry heater design.

The Applicant further submitted that it is her desire to have this heating unit constructed on-site. In the alternative, she advised that she may look at having a pre-fabricated model installed, but emphasized that this was not her preference. In this regard she requested, if the Commission could not render a decision in favour of the proposed heater, that they make a decision on the specific elements of construction such as the foundation and chimney.

In summation the Applicant stated that, based on her substantial research, and as outlined in the books she had entered into evidence, "the major components of the downdraft masonry heater ensure its proper operation and safety." She reiterated that this system is universally recognized and that its design has been proven to operate successfully for over a century. In this regard she could foresee no reason that the proposal would not provide sufficiency of compliance with the intent of the OBC.

6. Respondent's Position

The Designate for the Respondent submitted that the proposed contraflow heater does not comply with the prescriptive requirements outlined in the Ontario Building Code. He further stated that the drawings submitted with the permit application were insufficient to determine compliance in certain areas. He advised that the City had concerns with respect to the risk of smoke and fire that may be associated with this type of downdraft unit and needed to have regard for the safety of the occupants of the dwelling. He went on to state that in ensuring safety, the City is bound by the standards outlined in the OBC. Those standards, he argued, do not cover the type of heating unit design anticipated in this application.

The Designate continued by stating that, in his experience, he had approved four similar "fireplaces". Those structures, however, had engineering approvals and full specifications were provided. He submitted that City staff have been trying to advise the Applicant of this for some time, to no avail. When questioned in relation to the difficulties encountered by the Applicant in retaining an engineer, the Designate suggested that perhaps the wrong type of engineers were being contacted or that the information being provided for their consideration was not sufficient. For this project he advised that a mechanical engineer would be required. He further advised that, in his capacity with the City, however, he was unable to refer the Applicant to a specific engineer because of the municipality's policies on the referral of professionals. The Designate also stated that he had never been made aware of any difficulties encountered by others who have required the services of an engineer for similar projects.

In respect to the Applicant's suggestion regarding a prefabricated model, the Designate responded that, from the City's point of view, acceptance of that proposal would be no different from being provided with documentation from a qualified engineer. The key component is that certification is provided in both instances as to the function and operation of the unit.

In conclusion, the Designate stated that, by virtue of its design, some aspects of this fireplace are not covered by the OBC which is used as a prescriptive guideline for approvals. In absence of any substantive information from a professional engineer that would lead him to reach an alternate conclusion, he is not in the position to grant a building permit.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed radiant thermal mass brick heater, having a Finnish design, will provide sufficiency of compliance with Sections 9.21. and 9.22. of the Ontario Building Code at 5 Ennismore Place, Toronto, Ontario, on condition that:

a) The Applicant obtain stamped design drawings and construction specifications from a qualified professional engineer(s) licensed in Ontario.
b) Details and timing of required site inspections of materials and construction must be outlined by the engineer(s).
c) Upon completion, the drawings, specifications and site inspection details be provided to the City of Toronto and a permit issued based on that submission.
d) During construction and upon completion, site inspections be carried out by the design engineer(s) in accordance with the details submitted to the City.

8. Reasons

i) The contraflow masonry heater anticipated by this application is a proven system recognized for use in Europe with an established history of proven performance.
ii) Despite the difference in design between the proposed heater and a conventional fireplace, with expert engineering, occupant safety will be maintained and potential risks minimized.
iii) As the proposal will comply with the ASTM E 1602-94 standard, the BCC considers the design of the heater as an acceptable alternative to the prescriptive requirements of OBC Sections 9.21. and 9.22.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Article 9.12.2.2. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Lyle Dayman, property owner, Forest, Ontario, for the resolution of a dispute with Mr. Bob Hexter, Chief Building Official, County of Lambton, Ontario, to determine whether the shallow (450 to 500 mm), insulated garage footings and foundations provide sufficiency of compliance with Article 9.12.2.2. of the Ontario Building Code at R.R. # 2, 6494 Proof Line Road, Forest, Ontario.

APPLICANT	Mr. Lyle Dayman, 6494 Proof Line Road Forest, Ontario
RESPONDENT	Mr. Bob Hexter Chief Building Official County of Lambton
PANEL	Dr. Kenneth Peaker, Chair Mr. Michael Steele Mr. Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	July 19th, 2001
DATE OF RULING	July 19th, 2001
APPEARANCES	Mr. Bob Hexter Chief Building Official County of Lambton **The Respondent**

RULING

1. The Applicant

Mr. Lyle Dayman, property owner, Forest, Ontario, has applied for a building permit under the Building Code Act, 1992 and is in the process of constructing a detached garage at 6494 Proof Line Road, Forest, Ontario.

2. Description of Construction

The Applicant is intending to construct a detached garage on his property. The garage would accommodate two vehicles and is proposed to be approximately 1, 008 ft^2 in building area and one storey in building height. This structure would be an unheated accessory building, of combustible construction, located on a property which also contains a residential dwelling having a Group C occupancy classification.

The construction in dispute involves the as-installed shallow insulated footings that would support the proposed garage structure. The footings have been installed approximately 400 mm - 500 mm into the clay soil. They have been insulated with 304 mm (1 ft) of 25 mm (1 in) Styrofoam SM insulation applied vertically on the foundation wall below grade and 914 mm (3 ft) of 25 mm (1 in) Styrofoam SM insulation applied horizontally to form an "L" shape with the vertical applied SM.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the shallow (450 to 500 mm), insulated garage footings and foundations provide sufficiency of compliance with Article 9.12.2.2. of the Ontario Building Code.

Sentence 9.12.2.2.(1) states that, except as provided in Sentences (4) and (5), the minimum depth of foundations below finished ground level must conform with Table 9.12.2.2. For foundations located in clay soil, the Table indicates that footings and foundation for spaces that are not heated must be 1.2 m (3 ft 11 in) in depth but not less than the depth of frost penetration. However, Sentence 9.12.2.2.(5) permits foundation depths to be decreased where experience with local soil conditions shows that lesser depths are satisfactory or where the foundation is designed for lesser depths. The Code provision in this regard would require this design to be carried out by a person qualified in the specific method applied and based on a subsurface investigation.

As noted above, the footings and foundations subject to this dispute have a depth of only 400 mm - 500 mm but have been provided with some insulation. From the information provided however, and in the opinion of the respondent, it does not appear as though a specific design has been carried out by a person qualified in this field of work.

According to the Technical Background Information report submitted in connection with this matter from the Housing Development and Building Branch of the Ministry of Municipal Affairs and Housing, "E.I. Robinsky and K.E. Bespflug recommend that in unheated structures a continuous insulation mat be provided beneath the entire area of both floor and footings in addition to the required perimeter strip." In this instance, only insulation of the perimeter is being proposed.

4. Provisions of the Ontario Building Code

Article 9.12.2.2 Minimum Depth of Foundations

(1) Except as provided in Sentences (4) and (5), the minimum depth of *foundations* below finished ground level shall conform to Table 9.12.2.2.

(2) Where a *foundation* is insulated in a manner that will reduce the heat flow to the soil beneath the footings, the *foundation* depth shall conform to that required for *foundations* containing no heated space (See Appendix A.)

(3) The minimum depth of *foundations* for exterior concrete steps with more than 2 risers shall conform to Sentences (1) to (5).

(4) Concrete steps with 1 and 2 risers are permitted to be lain on ground level.

(5) The *foundation* depths required in Sentence (1) are permitted to e decreased where experience with local *soil* conditions shows that lesser depth are satisfactory, or where *foundation* is designed for lesser depths.

(6) The foundation depths required in Sentence (1) do not apply to *foundations* for *building* of other than masonry or masonry veneer construction

(a) whose superstructure conforms with the deformation resistance test in CAN/CAS-Z240.2.1., "Structural Requirements for Mobile Homes", or

(b) used as accessory *buildings* of not more than 1 *storey* in *building height* and not more than 50 m^2 (538 ft^2) in *building area.*

Table 9.12.2.2.
Minimum Depths of Foundation
Forming Part of Sentence 9.12.2.2.(1)

Type of *Soil*	*Foundation* containing heated *Basement* or Crawl Space[1]		*Foundation* Containing no Heated Space[2]	
	Good *Soil* Drainage	Poor *Soil* Drainage	Good *Soil* Drainage[3]	Poor *Soil* Drainage
Rock	No limit	No limit	No limit	No limit
Coarse grained *soils*	No limit	No limit	No limit	Below the depth of frost penetration
Silt	No limit	No limit	Below the depth of frost penetration	Below the depth of frost penetration
Clay or *soils* not clearly defined[4]	1.2 m (3 ft 11 in)	1.2 m (3 ft 11 in)	1.2 m (3 ft 11 in) but not less than the depth of frost penetration	1.2 m (3 ft 11 in) but not less than the depth of frost penetration
Column 1	2	3	4	5

Notes to Table 9.12.2.2.:
(1) Foundation no insulated to reduce heat loss through the footings.
(2) Including foundations containing heated space insulated to reduce heat loss through the footings.
(3) To not less than the depth of frost penetration.
(4) See Appendix A.

5. Applicant's Position

The Applicant did not attend the hearing and chose to rely on his written submission. His position was that the footings have been installed as suggested by Dow Chemical. In a memo to the Applicant from Dow, concerning insulated shallow foundations, the company outlined the requirements for Styrofoam SM insulation to provide frost protection. The advice in this memo was based on the information supplied to them by the Applicant. In addition, as an attachment to their memo, the Dow Chemical included several pages of specifications from their design manual.

6. Respondent's Position

The Respondent submitted that soils in this region offer poor drainage and are susceptible to the penetration of frost. In relation to these site conditions, footings are required to be installed at a depth of 1.2 m. The Applicant's footings are significantly more shallow than what is required by the Building Code.

In respect to the memo provided by Dow Chemical, the Respondent advised that Dow's recommendations were based upon the requirements for a heated structure. The Applicant's garage will be unheated. The requirements for insulating the shallow footings and foundation of an unheated structure far exceed what has been provided by the Applicant. He stated that he has received no documentation from a qualified individual to convince him that the as-installed footings would provide sufficient protection from frost penetration. Such convincing documentation would be required to permit the footings to remain at a lesser depth than the standard OBC requirements.

7. Commission Ruling

It is the decision of the Building Code Commission that the shallow insulated garage footings and foundation will provide sufficiency of compliance with Article 9.12.2.2. of the Ontario Building Code at R.R. #2, 6494 Proof Line road, Forest, Ontario, on condition that:

a) The Applicant obtain a stamped design from a professional geotechnical engineer and implement that design for the insulation installation.

8. Reasons

i) The shallow footings and foundation will not be at significant risk from frost penetration provided that the insulation installation meets the specifications designed and approved by a qualified professional.

Ruling No. 01-32-825
Application # 2001-37

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Sentence 3.3.3.3.(1) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Ed Applebaum, Principal, Montgomery Sisam Associates Inc. Architects, Toronto, Ontario, for the resolution of a dispute with Ms. Brenda Campbell, Chief Building Official, City of Brampton, to determine whether the proposed corridor design provides sufficiency of compliance with Sentence 3.3.3.3.(1) of the Ontario Building Code at the Extendicare Canada - Long Term Care Facility, Davis Campus, Sheridan College, Brampton, Ontario.

APPLICANT	Mr. Ed Applebaum, Principal Montgomery Sisam Associates Inc. Architects Toronto, Ontario
RESPONDENT	Ms. Brenda Campbell Chief Building Official City of Brampton
PANEL	Dr. Kenneth Peaker, Chair Mr. Fred Barkhouse Mr. Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	July 5, 2001
DATE OF RULING	July 5, 2001
APPEARANCES	Mr. Leszek Muniak, Principal Larden Muniak Consulting Inc. Toronto, Ontario **Agent for the Applicant** Ms. Lillyan McGinn Manager, Plans and Permits City of Brampton **Designate for the Respondent**

RULING

1. The Applicant

Mr. Ed Applebaum, Principal, Montgomery Sisam Associates Inc. Architects, Toronto, Ontario, has received a building permit under the Building Code Act, 1992 and is constructing a rest home known as the Extendicare Canada - Long Term Care Facility, Davis Campus, Sheridan College, Brampton, Ontario.

2. Description of Construction

The Applicant is in the process of constructing a long term care facility having a Group B, Division 2, care and treatment occupancy classification. The facility is divided into 4 smaller buildings (Wings A, B, C and D) separated by two-hour rated firewalls. The entire structure will be two storeys in building height, 4,379 m^2 in building area, and is proposed to be of combustible construction. The building is intended to be fully sprinklered and equipped with a point addressable fire alarm system.

The subject care facility, when complete, will consist of a central portion, referred to as Wing D, and three residential areas, referred to as Wings A, B, and C, that will be connected through the central building. Wings A, B and C will contain the residential sleeping rooms. Wing D will contain ancillary occupancies to serve the needs of the residents of the entire facility. All wings are to be operated as a single facility.

The construction in dispute involves the proposed dead-end corridors that would be constructed on the ground floor and second floor of the wings in which the residential sleeping rooms would be located. Each of the corridor extensions would measure 7.4 m in length by 3.2 m in width and serve a single sleeping room. The travel distance from the egress door of each sleeping room to the point in the corridor where the resident has two directions of travel toward an exit is 4 metres. A total of 12 sleeping rooms would be affected by this proposal.

The original drawings submitted to the City, and for which a permit was issued, do not include the dead end corridor configuration. To obtain sufficiency of compliance with the Code requirements, the Applicant is offering certain compensating measures including additional smoke detectors and an ancillary paging system.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed corridor design provides sufficiency of compliance with Sentence 3.3.3.3.(1) of the Ontario Building Code.

Article 3.3.3.3. sets out the design criteria for corridors serving care and detention facilities. According to Sentence (1), no public corridor serving patient or resident rooms is allowed to contain a dead-end portion unless there is a second separate exit located within the area served by that portion. The intended dead-end sections are public corridors and would serve the residential wings of the proposed facility. These corridors will be fully sprinklered and are proposed to be equipped with smoke detection devices. However, no separate exit is proposed in the area served by the dead-end portion of the corridors.

At issue is whether the proposed fire safety measures incorporated into the design of the facility sufficiently compensate for the Code requirements that prohibit dead-end corridors.

4. Provisions of the Ontario Building Code

Article 3.3.3.3. Corridors

(1) A corridor used by the public or serving patients or residents shall have no dead-end portion unless the area served by the dead-end portion has a second and separate *means of egress*.

5. Applicant's Position

The Agent for the Applicant described the proposed facility as a fully sprinklered, B2 occupancy that will be provided with a fire alarm system. As an architectural feature in the design of the building, he is proposing dead-end corridors at the ends of the hallways in the residential wings. There will be windows located at the end of these corridors that would enable residents to view the grounds. This is an important feature, he emphasized, since many of the residents are confined to the building and walk the halls for exercise. These windows would allow residents an opportunity to view the outside world. This would be beneficial to their mental well-being.

The Agent advised that the corridors would not contain any occupancy or furnishings. He stated that additional smoke detectors are proposed that would be located within 2 ft on either side of doors of the residential suit that would be served by the corridor. The hallway detectors would signal the central annunciation panel and, in addition, an ancillary system is proposed that would allow the nurses to be paged and advised of where an alarm had been activated. This ancillary system would exceed the current Code requirements. He continued by advising that there would be nursing staff on site at all times to respond to such a page. With these measures, the Agent argued, there is no reduction in life safety to the residents of the facility and, therefore, sufficiency of compliance with the OBC would be achieved.

The Agent concluded his argument by stating that he recognized the OBC requirements in respect to corridor design but did not believe there would be any risks associated with this proposal. He brought to the Commission's attention a previous BCC ruling for a facility that had been constructed using the same design in a different area of the province. The application for the as-built facility received a favourable ruling and so, he argued, should this proposal.

6. Respondent's Position

The Designate for the Respondent submitted that the Applicant had originally proposed this corridor design in their building permit application. The design was reviewed, bearing in mind the previous BCC ruling, and ultimately rejected by staff. The Applicant then brought forward a Code compliant design that was accepted by the municipality.

The Designate advised that many of the safety features emphasized by the Applicant are already required by the Building Code. The only exception would be the additional smoke detectors and the paging of nurses. Annunciation at the nurses station is an OBC requirement. In the City's opinion, the additional detectors, located a short distance from those required by the Code, do not provide any

added value in terms of safety. In addition, they are not convinced that the paging of nurses to identify the location of an alarm is sufficient to compensate for a Code compliant corridor design. Many of the patients may suffer from dementia or have limited mobility and may become confused or trapped within a dead-end corridor.

The Designate argued that each BCC ruling must be considered independently and that the previous decision is not precedent setting. They have suggested an alternative to the Applicant that would include a second means of egress through the residential suite and thereby allow the dead-end corridors in the proposed locations. This alternative was rejected primarily because the exit doorway would have been located within the bathroom facility of the residential suite. This raised privacy concerns for those involved. The Designate stated that she is sympathetic to the Applicant's desire to achieve a design that would allow those travelling the corridors to have a view of the outside environment, but must consider the safety of the occupants first and foremost.

In summation, the Designate submitted that there is a reason why dead-end corridors are not permitted by the Code. One cannot predict how an individual will react in an emergency situation. This holds doubly true for those with diminished mental or physical capabilities. She emphasized that there are other alternative designs available that could allow the Applicant to achieve the desired goals.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed dead-end corridor design does not provide sufficiency of compliance with Sentence 3.3.3.3.(1) of the Ontario Building Code at the Extendicare Canada - Long Term Care Facility, Davis Campus, Sheridan College, Brampton, Ontario.

8. Reasons

i) Upon full examination of the proposed design, and after hearing from both parties, the compensating measures offered in lieu of the OBC requirements do not allow for sufficiency of compliance to be achieved.

ii) The City's argument was complete and persuasive. No attempt at compliance has been made, despite the initial drawings for which a permit was issued.

iii) Sufficiency of compliance has not been achieved in the circumstances of the present case.

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Article 3.2.9.1. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. William Barnes, V.P., Technical Services, Atlas Tube Inc., Harrow, Ontario, for the resolution of a dispute with Mr. Kevin Carter, Chief Building Official, Town of Essex, to determine whether the enlarged manufacturing and warehouse facility with a total building area of 27, 221 m^2 that is not equipped with a standpipe and hose system provides sufficiency of compliance with Article 3.2.9.1. of the Ontario Building Code at Atlas Tube Inc., 200 Clark Street, Harrow, Ontario.

APPLICANT	Mr. William Barnes V.P. Technical Services, Atlas Tube Inc., Harrow, Ontario
RESPONDENT	Mr. Kevin Carter Chief Building Official Town of Essex
PANEL	Dr. Kenneth Peaker, Chair Mr. Fred Barkhouse Mr. Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	July 5, 2001
DATE OF RULING	July 5, 2001
APPEARANCES	Mr. William Barnes, V.P., Technical Services, Atlas Tube Inc., Harrow, Ontario **The Applicant** Mr. Kevin Carter Chief Building Official Town of Essex **The Respondent**

RULING

1. The Applicant

Mr. William Barnes, V.P., Technical Services, Atlas Tube Inc., Harrow, Ontario, has received an Order to Comply under the Building Code Act, 1992 to provide a standpipe and hose system at the Atlas Tube Inc. facility, 200 Clark Street, Harrow, Ontario.

2. Description of Construction

The Applicant has constructed or is in the process of constructing three large new additions to a manufacturing/warehouse facility. The buildings are being constructed in three phases with building areas of 12, 821 m^2, 5, 574 m^2 and 8, 826 m^2 respectively, for a total building area of 27, 221 m^2. All of the buildings are standardized at 29.97 metres wide, with various lengths and a building height of 12.19 m (one storey). The facility is of noncombustible construction and classified as a Group F, Division 3, low hazard industrial occupancy. The building is not equipped with a sprinkler system, a standpipe and hose system or a fire alarm system (with the exception of a small office area).

The facility is operated by Atlas Tube Inc., a manufacturer of structural steel tubing products. According to the Applicant, of the total 27, 221 m^2 of building area, approximately 4, 961 m^2 is used for manufacturing purposes with the balance of the space used for the storage of raw material and finished goods. The raw material is comprised of steel coils of various widths and diameters. The finished goods consist of hollow steel structural tubes of various shapes and sizes. The finished goods are not packaged or wrapped for shipment and neither the raw material nor the end product contain any oil or petroleum products. In the manufacturing process, a synthetic tube mill coolant is used for lubricating and cooling the product. This coolant consists of 95% water and 5% concentrate that, again, contains no petroleum products. Movement of materials throughout the facility is carried out with electrically powered overhead cranes of varying capacities.

The construction in dispute involves the entire facility where, despite the building area being in excess of 3,000 m^2, a standpipe and hose system is not being provided. Because of the nature of this operation, the Applicant has taken the position that the introduction of such a water source is inappropriate and potentially hazardous. In lieu of the required standpipe and hose system, the Applicant is proposing several compensating measures.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the manufacturing and warehouse facility, having a total building area of 27,221 m^2 and not being equipped with a standpipe and hose system, provides sufficiency of compliance with Article 3.2.9.1. of the Ontario Building Code, in light of the compensating measures being offered by the Applicant.

Article 3.2.9.1. of the Building Code requires that a one storey building with an area in excess of 3,000 m2, and containing a Group F, Division 3 occupancy, be provided with standpipe and hose system, if the building is not sprinklered. The building in question, when fully complete, will be well in excess of 3,000 m^2 in area. The facility is not sprinklered and, as mentioned above, is not proposed to be equipped with a standpipe and hose system.

In lieu of the requirements of Article 3.2.9.1, the Applicant is offering certain measures to provide sufficiency of compliance, including the provision of a fire access route around the entire facility, an increased number of portable fire extinguishers and registration, on title, that the exemption applies only to the current use of the building.

4. Provisions of the Ontario Building Code

Article 3.2.9. Standpipe Systems

3.2.9.1. Where Required

(1) Except as provided in Sentences (4) to (7), a standpipe system shall be installed in every building that

(a) is more than 3 storeys in building height,
(b) is more than 14 m (45 ft 11 in) high measured between grade and the ceiling of the top storey, or
(c) is not more than 14 m (45 ft 11 in) high measured between grade and the ceiling of the top storey but has a building area exceeding the area shown in Table 3.2.9.1. for the applicable building height if the building is not sprinklered.

Table 3.2.9.1.
Building Limits without Standpipe Systems
Forming Part of Sentence 3.2.9.1.(1)

Occupancy Classification	Building Area, m^2 (ft^2)		
	1 Storey	2 Storeys	3 Storeys
A	2 500 (24,200)	2 000 (21,500)	1 500 (16,100)
C	2 000 (21,500)	1 500 (16,100)	1 000 (10,800)
D	4 000 (43,100)	3 000 (32,300)	2 000 (21,500)
F, Division 2	2 000 (21,500)	1 500 (16,100)	1 000 (10,800)
F, Division 3	3 000 (32,300)	2 000 (21,500)	1 000 (10,800)
Column 1	2	3	4

5. Applicant's Position

To assist the Commission in understanding the nature of this operation, the Applicant described the building and advised that only 4, 961 m^2 of the entire 27, 221 m^2 would be used for manufacturing purposes. The remainder of the facility is to be used for storage of raw material and finished products. The Applicant went on to advise that natural gas fired infrared tube style heaters, mounted in the trusses of the ceiling, are the only source of heat for the building. They are located only in the production areas and where employees are working. The Applicant further emphasized that there were no oil or petroleum products used in the manufacturing operation; neither in the production nor the materials used.

The Applicant argued that, because this facility was a steel manufacturing operation, a standpipe and hose system was not appropriate. Water damage to either the raw material or the finished product would render them virtually worthless. The facility also contains sensitive electronic equipment, including computers and other communication devices, that could incur damage from such a water

source. In addition, the Applicant advised that movement of material through the facility is conducted by overhead cranes operated with electric motors. The cranes have exposed conductor bars that could prove hazardous and potentially fatal, if a stream of water were to strike either the power bar of the electric motors. In this regard, the Applicant suggested that it is more appropriate to fight fire in this facility with CO_2 extinguishers. In fact, the Applicant submitted, the Fire Department agrees that it would not be advisable to fight a fire with water in this environment.

In support of his request to omit the standpipe and hose system, the Applicant advised that the local Fire Hall is located only 2 minutes away and the Fire Department has been provided with a site plan showing all access points and fire hydrant locations. He stated that an access route around the entire plant will be maintained year round and the number of fire extinguishers in the facility will be increased beyond OBC requirements. The status of these extinguishers is checked by an outside contractor as well as internal staff examinations. In addition, there are security staff on site 24 hours a day, 7 days a week. He is also prepared to register on title the fact that the exemption for a standpipe and hose system applies only to this use. Any change of use would require approval of the Town of Essex Building Department.

The Applicant advised that both the municipality and the Fire Department have indicated that they are content with the measures proposed in lieu of a standpipe and hose system at this location. He brought to the Commission's attention several similar BCC rulings and suggested that his situation also warranted a favourable decision.

6. Respondent's Position

The Respondent submitted that both he and Fire Department officials have agreed that the compensating measures offered by the Applicant are sufficient to provide sufficiency of compliance, but his hands are tied because the Code requires that an F3 occupancy in excess of 3, 000 m^2 be equipped with a standpipe and hose system. His main concern, however, is with respect to a change of use in the building if the requested relief is granted to Atlas Tube. He noted that the Applicant has agreed to register on title an explanation that the exemption applies only to the existing use and any subsequent owners would be aware of the standpipe and hose requirement.

He acknowledged that the proposed number of fire extinguishers exceed the OBC requirements and emphasized that the Fire Department has advised that they wouldn't want to fight a fire in this building with water. If a standpipe and hose system were provided, it would not be used by the Fire Department. According to the Respondent, the Fire Department would prefer to use foam or the extinguishers, whichever was more appropriate given the situation.

7. Commission Ruling

It is the decision of the Building Code Commission that the enlarged manufacturing warehouse facility with a total building area of 27, 221 m^2 that is not equipped with a standpipe and hose system provides sufficiency of compliance with Article 3.2.9.1. of the Ontario Building Code at Atlas Tube Inc., 200 Clark Street, Harrow, Ontario on condition that:

a) A year round access route be maintained around the entire plant for firefighting purposes.
b) ABC type portable fire extinguishers be provided and located every 50 feet on both sides of the building with bulk units provided at each of the four hydraulic units in the manufacturing area.
c) ABC type portable fire extinguishers be provided at each door on both sides of the building.

d) In the main electrical rooms (27,6000V/4, 160V/480V) $C0_2$ type extinguishers are to be provided.

e) The Applicant must register on title that the exemption for a standpipe and hose system is for this use only. Change of use will automatically fall under the jurisdiction of the Town of Essex Building Department.

8. Reasons

i) The local fire hall is two minutes away and the Fire Department has been provided with a site plan showing all access points and fire hydrant locations.

ii) There are two fire hydrants on the subject property and an additional two located along Clark Street on the south side of the plant.

iii) The status of the requisite fire extinguishers is checked by an outside contractor as well as staff at the facility.

iv) The staff is trained in the use of extinguishers and a fire safety plan is in place.

v) A security department is on site 24 hours a day, 7 days a week.

vi) There was no objection registered from either the Fire Department or the Town of Essex Building Department.

vii) The introduction of water can be a safety hazard when considering the use of this building.

viii) The Fire Department has advised of problems that would be encountered with the use of water to fight fires at this location.

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Article 3.2.9.1. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Grant Stummer, CEO, Universal Mold Inc., Mississauga, Ontario, for the resolution of a dispute with Mr. Agris Robeznieks, Chief Building Official, City of Mississauga, to determine whether the as-constructed infill addition that joins together two previously separate structures thereby creating a building having an area of 2, 229 m^2 (23,984 ft^2), and that is not equipped with a standpipe and hose system, provides sufficiency of compliance with Article 3.2.9.1. of the Ontario Building Code at Universal Mold Ltd., 1746 Mattawa Avenue, Mississauga, Ontario.

APPLICANT	Grant Stummer, CEO Universal Mold Inc. Mississauga, Ontario
RESPONDENT	Mr. Agris Robeznieks Chief Building Official City of Mississauga
PANEL	Dr. Kenneth Peaker, Chair Mr. Fred Barkhouse Mr. Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	July 5, 2001
DATE OF RULING	July 5, 2001
APPEARANCES	Mr. Peter DeMan DeMan Construction Mississauga, Ontario **Agent for the Applicant** Mr. Paul Farrant City of Mississauga **Designate for the Respondent**

RULING

1. The Applicant

Mr. Grant Stummer, CEO, Universal Mold Inc., Mississauga, Ontario, has received a building permit under the Building Code Act, 1992 and has constructed an addition at Universal Mold Ltd., 1746 Mattawa Avenue, Mississauga, Ontario.

2. Description of Construction

The Applicant has constructed a 315 m^2 addition that joins two existing buildings creating a building with an area of 2, 229 m^2. The facility is owned and operated by Universal Mold Ltd., a plastic mold manufacturer. The building is of noncombustible construction and is not equipped with a fire alarm system, a sprinkler system or a standpipe and hose system. The facility is classified as a Group F, Division 2, industrial occupancy.

The construction in dispute involves the addition which fills the 9.14 m (30 ft) space between two existing buildings. The addition is approximately 9.14 m (30 ft) by 30.48 m (100 ft) and is to be used for a loading dock. The construction of the addition triggers the building area requirement in the OBC for a standpipe and hose system. However, none is proposed in this instance. The standpipe and hose is required to be located only within the area of the addition. The remainder of the building, as it is already in existence, is not subject to the standpipe and hose requirement.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the as-constructed infill addition, joining together two previously separate structures and creating a building with an area of 2, 229 m^2 (23,984 ft^2), but not equipped with a standpipe and hose system, provides sufficiency of compliance with Article 3.2.9.1. of the Ontario Building Code.

Article 3.2.9.1. requires that a one storey building with an area in excess of 2, 000 m^2, and containing a Group F, Division 2 occupancy, be provided with a standpipe and hose system if the building is not sprinklered. The building in question is 2, 229 m^2 as a result of the construction of the addition which joined two smaller buildings. The facility is not sprinklered and, as mentioned above, is not equipped with a standpipe and hose system.

4. Provisions of the Ontario Building Code

Article 3.2.9. Standpipe Systems

3.2.9.1. Where Required

(1) Except as provided in Sentences (4) to (7), a standpipe system shall be installed in every building that

(a) is more than 3 storeys in building height,
(b) is more than 14 m (45 ft 11 in) high measured between grade and the ceiling of the top storey, or

(c) is not more than 14 m (45 ft 11 in) high measured between grade and the ceiling of the top storey but has a building area exceeding the area shown in Table 3.2.9.1. for the applicable building height if the building is not sprinklered.

Table 3.2.9.1.
Building Limits without Standpipe Systems
Forming Part of Sentence 3.2.9.1.(1)

Occupancy Classification	Building Area, m^2 (ft^2)		
	1 Storey	2 Storeys	3 Storeys
A	2 500 (24,200)	2 000 (21,500)	1 500 (16,100)
C	2 000 (21,500)	1 500 (16,100)	1 000 (10,800)
D	4 000 (43,100)	3 000 (32,300)	2 000 (21,500)
F, Division 2	2 000 (21,500)	1 500 (16,100)	1 000 (10,800)
F, Division 3	3 000 (32,300)	2 000 (21,500)	1 000 (10,800)
Column 1	2	3	4

5. Applicant's Position

The Agent for the Applicant submitted that by joining the 30 ft space between the two existing buildings, a structure had been created that is 10% greater than the maximum area permitted to exempt a building with an F2 major occupancy from the standpipe and hose requirement. He argues that the Applicant has exceeded the provisions by a mere 229 m^2. He continued by advising that the buildings will still be somewhat independent, with the exception of a few doors and a drive through area. As a result, the walls cannot be considered firewalls and, therefore, the total structure is considered one building for the purposes of the Code.

The Agent also advised that, since the manufacturing area of the building was relatively small (approximately 1, 746 m^2), there was a strong possibility that the use could be re-classified as a Group F, Division 3 occupancy. If the facility were an F3 occupancy, the standpipe and hose requirement would no longer be an issue; a building of up to 3, 000 m^2 would not require this system. They are currently pursuing this possibility with their consultants and City officials.

The Agent acknowledged that, given this present situation, the OBC requires a standpipe and hose system in the addition, but advised that providing this connection would be cost prohibitive. In addition, he didn't believe that much value would be added as the system would only be provided in the small addition at the centre of the building. In lieu of the standpipe and hose system, the Applicant proposed to provide extra protection by way of additional portable ABC type fire extinguishers and two mobile cart mounted 50 lb units.

The Agent further advised that the building is accessible from all sides for firefighting purposes, but when questioned, advised that there was not necessarily a designated route that was maintained year round. He stated that there were many doors around the building that could be used for search and rescue operations.

In summation, the Agent submitted that there is a fire safety plan in place and employees have been trained in case of an emergency. He felt that the proposed measures would be sufficient to compensate for the OBC requirement, given the size of the affected addition and the fact that the building exceeds the Code parameters by such a small amount.

6. Respondent's Position

The Designate for the Respondent submitted that a building permit was issued for this addition on the basis that a standpipe and hose system would be provided. He explained that the nature of this business with the use of plastics is relatively hazardous. As a result, the Fire Department would prefer an inexhaustible supply of water for firefighting purposes. While he recognized that only the small addition was affected by this requirement, he noted that this was now considered one building; a fire might not be as easily contained as when the buildings were separate.

He further submitted that the mobile carts, proposed by the Applicant, may be difficult to use and only provide a limited firefighting capability. The Fire Department may require the standpipe connection to adequately fight a fire within this building. A building the size of this structure, he argued, starts to exceed the limit of an advancing hose line. While they would not likely use the hose provided with the system, they may require the standpipe connection to reach certain areas of the facility.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-constructed addition that joins together two previously separated structures, thereby creating a building having an area of 2, 229 m^2 and that is not equipped with a standpipe and hose system does not provide sufficiency of compliance with Article 3.2.9.1. of the Ontario Building Code at Universal Mold Ltd., 1746 Matheson Avenue, Mississauga, Ontario.

8. Reasons

i) The compensating measures offered do not provide sufficiency of compliance with the OBC requirements.

ii) Given the relative hazard posed by the use of plastics at this facility, having an F2 classification, the Fire Department would reasonablely require an inexhaustible supply of water that the proposed mobile cart units and additional fire extinguishers would not provide.

Ruling No. 01-29-822
Application # 2001-16

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Sentence 3.4.4.4.(6) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. George Nichols, George Nichols Architect Inc., Ottawa (Kanata), Ontario, for the resolution of a dispute with Ms Catherine Junop, Director of Building Services, City of Ottawa, to determine whether the retrofit elevator, installed to permit barrier-free accessibility throughout the existing two storey building, and proposed without separation in a lobby containing an exit stair, provides sufficiency of compliance with Sentence 3.4.4.4.(6) of the Ontario Building Code at 232 Herzberg Road, Ottawa, Ontario.

APPLICANT	Mr. George Nichols George Nichols Architect Inc. Ottawa, Ontario
RESPONDENT	Ms Catherine Junop Director of Building Services City of Ottawa
PANEL	Dr. Kenneth Peaker, Chair Mr. Robert De Berardis Mr. John Guthrie
PLACE	Toronto, Ontario
DATE OF HEARING	June 21, 2001
DATE OF RULING	June 21, 2001
APPEARANCES	Mr. George Nichols George Nichols Architect Inc. Kanata, Ontario **The Applicant** Mr. Allan Morris Plan Examiner II City of Kanata **Designate for the Respondent**

6. Respondent's Position

The Designate for the Respondent submitted that, in this instance, building permits were issued in phases. When a permit was issued for the construction of the addition, a second stairwell exit, at the end of the building, was indicated on the plans. As a result, this lobby exit was not an exit required by the Code and, therefore, the elevator opening was approved.

Upon inspection it was discovered that the second exit was omitted from the building plan and now the situation requires this new exit to be considered a required exit under the Code. The City's interpretation of the requirements in this regard is that an elevator opening is not allowed in a required exit and must be fire separated from the exit area. In the Designate's opinion, whether the building is two storeys or ten storeys, the application of the Code would be the same. The separation is required to protect individuals using the exit stair.

7. Commission Ruling

It is the decision of the Building Code Commission that the retrofit elevator, installed to permit barrier-free accessibility throughout the existing two-storey building, and proposed without separation in a lobby containing a required exit stair, does not provide sufficiency of compliance with Sentence 3.4.4.4.(6) of the Ontario Building Code at 232 Herzberg Road, Ottawa, Ontario.

8. Reasons

i) The integrity of the required exit is compromised by the opening of the elevator.
ii) The compensating measures, offered by the Applicant, are not adequate to achieve sufficiency of compliance with Building Code requirements.
iii) The elevator does not comply with Article 3.4.4.4. of the Ontario Building Code.

RULING

1. The Applicant

Mr. George Nichols, George Nichols Architect Inc., Ottawa (Kanata), Ontario, has received a building permit under the Building Code Act, 1992 and has constructed an addition to the existing building at 232 Herzberg Road, Ottawa, Ontario.

2. Description of Construction

The original building and the addition are both two storeys in building height and constructed of noncombustible material. The building is not equipped with either a sprinkler or a fire alarm system. The addition is approximately 30.66 m^2 (330 ft^2) in building area while the existing building has an area of approximately 1393.55 m^2 (15, 000 ft^2). The facility is currently used for administrative offices and is classified as a Group D occupancy.

The original building was constructed in the 1970s. Originally, a small area at the front of the building was used for administrative offices with the remainder of the building used for warehouse purposes. The owners have recently undertaken renovations and have constructed an addition, for use as a main entrance, located in the centre of the building along the north side.

The construction in dispute involves an elevator that opens into the entrance addition. The elevator was added to facilitate barrier-free movement throughout the building but is not a requirement of the Building Code. It serves both floor levels but is not isolated from the exit stair. In the original permit application, an interior corridor was proposed to run the length of the building and would have lead to an exit stair at both ends. During construction, however, one end of this corridor was eliminated to provide more leasable floor space area to one of the tenants. The new exit created in the middle of the building is now a required exit from the second storey.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the elevator, constructed without separation in a lobby containing an exit stair, provides sufficiency of compliance with Sentence 3.4.4.4.(6).

Article 3.4.4.4. outlines requirements for the maintenance of the integrity of exits. Sentence 3.4.4.4.(6) specifically provides that an exit shall not be designed for a purpose other than exiting the building, except that it may provide access to a floor area. In the opinion of the Housing Development and Building Branch of the Ministry of Municipal Affairs and Housing in their report to the Commission, the intent of this Sentence is "to ensure that exits are used only for exiting from a floor area with the exception that access is permitted through the exits to access another floor area."

In addition to the requirements of Sentence 3.4.4.4.(6), the OBC also requires, in Sentence 3.4.4.1.(1) that every exit be separated from the remainder of the building by a fire separation having a rating not less than, at a minimum, 45 minutes. In addition, Sentence 3.4.4.4.(1) provides that a fire separation that separates an exit from the remainder of the building shall have no openings, with several exceptions, none of which includes a door to an elevator hoistway.

In this instance, the exit contains an opening to an elevator that will service the two floors of the building. The entrance to the elevator has not been constructed with a fire separation from the remainder of the exit route.

4. Provisions of the Ontario Building Code

Sentence 3.4.4.4.(6)

(6) An *exit* shall be designed for no purpose other than for exiting, except that an *exit* is permitted also to be designed to serve as an access to a *floor area.*

5. Applicant's Position

The Applicant advised that the building in question is a 30 year old structure that has recently been renovated. As part of these renovations, an addition was designed and constructed for use as a new main entrance to the building. The owners considered it desirable to include an elevator in the addition to provide barrier-free access to the building and to assist in the movement of furniture and equipment between floors, when necessary.

The Applicant submitted that the original layout provided an internal corridor that would have allowed for access to an exit at both ends of the building. This design was abandoned, however, because a tenant requested use of part of the floor area in which the corridor would have run. As a result, the new entrance is now considered the second required exit in this building. In addition, the Applicant advised that the retrofit elevator was located within the new addition because it would have penetrated the roof of the existing structure if it had been located elsewhere.

The building, the Applicant stated, has two or three exits directly to grade. The concern with respect to OBC requirements is relevant only to the second floor. As a result, he is seeking relief from the Code requirements but preferably a ruling on the interpretation of the OBC provisions with respect to this issue. He argued that the Code does not specifically prohibit elevator openings in an exit area. This interpretation has built up over time. He further stated that the elevator door is fire rated and that the elevator is "providing access to a floor area" as permitted in the Code. He went on to suggest that the intent of the Code in this regard is applicable to multi-storey buildings and that an exception should be made in this case since the building is only two storeys in height. He would like to see the Code amended as it applies to two storey structures.

The Applicant suggested a number of scenarios that would allow the elevator to work within the existing confines. To enclose the elevator opening, he argued, would jeopardize the aesthetics of the entrance. He suggested that a sprinkler head could be provided in the elevator area; a screened enclosure could be provided around the elevator entrance, or a rolling fire shutter could be placed in front of the elevator door. The Applicant, with the support of the owners of the building submitted, however, that they would prefer that the Commission provide a ruling on the interpretation of the OBC provisions and view this entrance to be in compliance with the Code requirements. He reiterated that, in his opinion, the elevator is providing access to a floor area, as permitted by the Code. Safety, he stated, is not jeopardized. The Applicant emphasized that the elevator was installed to provide barrier-free access; this is of benefit to the building and its occupants.

Dated at Toronto this **21st** day in the month of **June** in the year **2001** for application number **2001-16.**

Ruling No. 01-27-820
Application # 2001-29

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the *Building Code Act*, S.O. 1992, c. 23, as amended.

AND IN THE MATTER OF Article 9.3.2.1. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Dave Kowalchuk and Dan Kowalchuk, owners, KYO Zen Art's (sic) Centre, for the resolution of a dispute with David J. Anderson, Chief Building Official, Municipality of Whitestone, Ontario, to determine whether the materials used in the construction of a rain porch addition to the building known as KYO Zen Art's Centre meet the requirements of Article 9.3.2.1. of the Ontario Building Code respecting the use of graded lumber, at R.R. 2, Dunchurch, in the Municipality of Whitestone, Ontario.

APPLICANT	Dave and Dan Kowalchuk Owners, KYO Zen Art's Centre Dunchurch, Ontario
RESPONDENT	David J. Anderson Chief Building Official Municipality of Whitestone
PANEL	Len King, Vice-Chair Michael Steele Fred Barkhouse
PLACE	Toronto, Ontario
DATE OF HEARING	June 7, 2001
DATE OF RULING	June 7, 2001
APPEARANCES	Dave and Dan Kowalchuk Owners, KYO Centre Dunchurch, Ontario **The Applicants**
	David J. Anderson Chief Building Official Municipality of Whitestone **The Respondent**

RULING

1. The Applicant

Dave and Dan Kowalchuk, owners and operators of KYO Zen Art's Centre, Dunchurch, Ontario, have received an order to comply under the *Building Code Act*, S.O. 1992, c. 23, as amended, to remedy certain alleged deficiencies at R.R. 2 (Dunchurch), in the Municipality of Whitestone, Ontario.

2. Description of Construction

The Applicants have constructed, what was referred to in the hearing as, a "rain porch" addition that will serve to provide shelter from the elements for patrons entering and exiting the building. This rain porch is approximately 27.87 m^2 (300 sq ft) and has been attached to the existing building known as the KYO Zen Art's Centre which operates as a restaurant and martial arts training facility. Both the rain porch and the main building are of combustible construction and have been crafted from rough timber. The main building is one storey in building height and is not equipped with either a fire alarm or a sprinkler system.

According to the records of the Respondent, the building is currently listed as both a Group D, business and personal services occupancy and a Group E, mercantile occupancy. It is their opinion, however, that the building actually operates a Group A, Division 2, assembly occupancy. The Applicants contend that they had applied for, and received from the municipality, a change of occupancy and have been given the approvals required to operate their facility as a restaurant and gymnasium, or dojo, for martial arts training.

The issue in dispute involves the materials used in the construction of the rain porch addition. The subject lumber is essentially rough cut timber that includes 8" diameter posts cemented into 4 inch concrete pads. The overhead rafters are comprised of 2"x 6"s set at 2 feet on centres and notched into the support beams. 1" board siding has been used for the side walls of the structure and all elements of construction have been connected with 5"-6" long spiked nails. The building materials were obtained from the same local mill as was the lumber used in the construction of the main building. The rough cut timber however, is not grade stamped, nor has it been evaluated by a licenced grader.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the materials used in the construction of the subject "rain porch" can be considered to meet the requirements of Article 9.3.2.1. respecting the grading of lumber.

Article 9.3.2.1. requires that lumber used for joists, rafters, trusses and beams, and for uses listed in Table 9.3.2.1., has a grade stamp to indicate its grade as determined by the "Standard Grading Rules for Canadian Lumber". Table 9.3.2.1. includes such uses as posts and beams not less than 114 mm in thickness, roof sheathing, plank frame construction, etc.

In this instance the rain porch, which is attached to the existing building, has been constructed with rough cut timber. The lumber was obtained from a local mill and is not labelled with a grade stamp, nor has an evaluation of the lumber been undertaken by an expert in the field. In an attempt to compensate for the lack of grade stamp, the Applicants submitted that, in 1994 they were required to obtain a letter from an architectural technologist in relation to the lumber used in the construction of the main

building. This letter, they argue, should be sufficient to prove that the material used in the rain porch addition is sufficient, since the lumber in dispute was obtained from the same source.

4. Provisions of the Ontario Building Code

Article 9.3.2.1. Grade Marking

(1) Lumber for joists, rafters, trusses and beams and for the uses listed in Table 9.3.2.1. shall be identified by a grade stamp to indicate its grade as determined by the NLGA "Standard Grading Rules for Canadian Lumber". (See Appendix A.)

5. Applicant's Position

The Applicants' case primarily involved their perception that the grading of the building materials used in the construction of a rain porch is an insignificant dispute that should have easily been resolved between the parties. The Applicants argued that, in 1994 they were "illegally" required to obtain certification from a qualified professional in respect to the quality and grade of lumber that was used in the construction of the main building. Although, at the time, this was not a requirement of the Building Code, they obtained a letter from an architectural technologist with respect to the method of calculation used in the analysis of the wood in question. This letter, dated June 6, 1994, was submitted as an exhibit for the Commission's consideration.

The Applicants submitted that, since they were required to obtain this certification in 1994, without justification, they should now be allowed some leeway in respect to the Code requirements for the materials used in the construction of the rain porch. This is especially true in light of the fact that the materials used now were obtained from the same mill and source as the lumber that was previously graded. They anticipated some give and take from the Respondent and were frustrated by his insistence that the wording of the Code be followed to the letter. In the Applicants' opinion, the Respondent was being completely unreasonable.

In addition, the Applicants contend that there is a general lack of public knowledge about the provision for graded lumber in the Building Code. They offered examples from around their area of the province where people were unaware of the Code requirements and had built structures that were significantly less sturdy than the rain porch they have attached to their building. It was suggested to the Commission that, an exemption should be allowed in this instance because of the lack of information and then, from this point on, the Code could be enforced; once word got out to others about the requirement for graded lumber.

When questioned, the Applicants advised that they had attempted to have the lumber graded but were experiencing considerable difficulty finding a qualified expert in the area who would perform the assessment. They had attempted to contact at least three sources to no avail. They emphasized however, that even if they could find a licenced grader to attend at the property and analyze the lumber, they do not feel that this level of certification is warranted. In their opinion, anyone using common sense and reasonable judgement could determine that the lumber used in the construction of the rain porch is of excellent quality.

6. Respondent's Position

The Respondent submitted that, as a result of his examination of the property it was discovered that ungraded lumber had been used in the construction of the rain porch. The municipality's records indicate that the subject property has been classified for Group D and E occupancies and, therefore, his assessment involved the Code requirements outlined in Part 9. He acknowledged that the facility was operating as a Group A, Division 2, assembly occupancy and, that being the case, Parts 3 and 4 of the Code would be applicable. In either event however, the requirement for graded lumber remains consistent within the provisions of the OBC.

When evaluating the construction using Part 9 of the Code, the Respondent submitted that Article 9.3.2.1. requires that lumber be grade stamped; Table 9.3.2.1. outlines the minimum grade for posts. He has received no confirmation that the lumber used in the subject construction meets the minimum standards set out in the Building Code. Even if a change in occupancy was confirmed, Part 4 of the OBC, specifically Article 4.3.1.1., requires that "*Buildings* and their structural members made of wood shall conform to CAN/CSA-0177-M, 'Qualification Code for Manufactures of Structural Glued-Laminated Timber'." When referring to these guidelines, the requirement for graded lumber remains consistent with Part 9 requirements.

In addressing the 1994 letter from the architectural technologist that was submitted by the Applicants as proof of lumber quality, the Respondent stated that this correspondence does not imply that the wood was graded; it does not outline specific grades that correspond to Table 9.3.2.1. As a result, there was no confirmation that the lumber used in the construction of the main building met the grade classifications set out in the Code.

In summation the Respondent stated that, while the wood may appear structurally sound, the opinion of a professional, trained in the analysis of lumber, would be required to determine the characteristics of the building material, including species group and grade.

7. Commission Ruling

It is the decision of the Building Code Commission that the materials used in the construction of the rain porch addition at the KYO Zen Art's Centre, R.R. 2, Dunchurch, must comply with the requirements of Article 9.3.2.1. of the Ontario Building Code. Furthermore, if the building is used as a Group A, Division 2 occupancy, the lumber would still be required to be graded in accordance with the requirements of the National Lumber Grades Authority.

8. Reasons

i) The Ontario Building Code requirements clearly mandate that graded lumber be used in order to provide assurance of minimum quality and performance of material.

ii) No satisfactory measure of compensation was offered in lieu of the OBC requirements.

Ruling No. 01-26-819
Application # 2001-28

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Articles 11.3.1.1. and 11.3.3.1. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. and Mrs. Daniel and Mary McIssac, property owners, Haliburton, Ontario, for the resolution of a dispute with Mr. W.J. Moore, Chief Building Official, Township of Sherborne Stanhope et al, Ontario, to determine whether the work undertaken on the existing house constitutes repair or renovation in accordance with Articles 11.3.1.1. and Sentence 11.3.3.1.(1) of the Ontario Building Code for the property located at Part of Lot 8, Concession 6 in the Township of Stanhope, Ontario.

APPLICANT	Mr.& Mrs. Daniel and Mary McIssac owners Haliburton, Ontario
RESPONDENT	Mr. W.J. Moore Chief Building Official Township of Sherborne Stanhope et al
PANEL	Mr. Len King, Chair Mr. Michael Steele Mr. Fred Barkhouse
PLACE	Toronto, Ontario
DATE OF HEARING	June 7, 2001
DATE OF RULING	June 7, 2001
APPEARANCES	Mr. & Mrs. Daniel and Mary McIssac Property owners **The Applicants** Mr. W.J. Moore Chief Building Official Township of Sherborne Stanhope et al **The Respondent**

RULING

1. The Applicant

Mr. Daniel and Mary McIssac, property owners, Haliburton, Ontario, have retroactively applied for and received a building permit under the Building Code Act, 1992 for renovation and repair work undertaken at the existing single detached dwelling at Part of Lot 8, Concession 6 in the Township of Stanhope, Ontario.

2. Description of Construction

The subject dwelling unit was constructed in 1920 and was occupied as a single detached residence until the time it was abandoned by a previous owner in the late 1980s. The building is one storey in building height, approximately 77.76 m^2 (837 ft^2) in building area and classified as a Group C occupancy. The dwelling was purchased by the Applicants in 1997 and is being used as their principal residence.

The construction in dispute involves the work that was undertaken on the dwelling since the time of purchase. Since that time, the Applicants have cleaned up and repaired the subject building. An itemized list of work conducted, according to Applicants, is as follows:

- removal of an dilapidated porch,
- removal of a garage that was destroyed by a tree,
- replacement of a hydro panel and wiring,
- repair of existing windows and doors,
- removal of garbage and old appliances,
- landscaping to improve lot grading,
- repair of a water pump,
- installation of a sump pump,
- repair of the existing drywall
- installation of carpet and/or hardwood over existing floor, and
- improvements to the bathroom including installation of ceramic tile and replacing the bathtub and sink.

Upon application for a previous permit to reconstruct the garage that had been destroyed by a fallen tree, the Applicants were advised of outstanding work orders which required that the building be secured and repaired and demolished. When the applicant made an application for a subsequent permit to cover the work they had already undertaken, the Respondent attached to the permit a list of deficiencies regarding the subject building. This list of deficiencies included such items as the requirement to install updated heating and ventilation systems and smoke alarms, provide a minimum size plumbing vent stack, provide attic access, install minimum required insulation throughout the dwelling, etc. It was his contention that the requirements of Parts 9 and 7 of the Building Code must be met in this instance.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the work undertaken on the existing house constitutes repair or renovation as outlined in Article 11.3.1.1. and Sentence 11.3.3.1.(1) of the Ontario Building Code.

Article 11.3.1.1. requires that, where a building system is altered or repaired, the performance level of the building must be at least equal to the performance level of the building prior to the material alteration. The building in question was cleaned and repaired by the Applicants. Fixtures were replaced and a dilapidated porch was removed.

Sentence 11.3.3.1.(1) outlines the provisions for basic renovation and states that, except as noted in Article 11.3.3.2., construction may be carried out to maintain the performance level of an existing building. This can be achieved by the reuse, relocation or extension of the same or similar materials, provided that the construction will not adversely affect things such as certain safety features or the structural adequacy of the building. Even if the work undertaken could be considered extensive renovations, the exceptions outlined in Sentence 11.5.2. would apply in this instance.

The exception to the provisions of Sentence 11.3.3.1.(1), as outlined in Article 11.3.3.2., relates to extensive renovation. This Article provides that, except as outlined in Subsection 11.5.2., extensive renovations, including removal and/or the addition of interior walls, ceilings, floor assemblies or roofs, structural and fire-resistance elements shall be constructed in compliance with other Parts of the Code. This exception, the Applicant's argue, does not apply in this case, as they did nothing more than repair existing walls, floors, windows etc.

The building that is the subject of this dispute was constructed in 1920. In the opinion of the Applicants, the work that was undertaken, as outlined in section 2 above, falls within the parameters outlined in Article 11.3.1.1. and Sentence 11.3.3.1.(1) of the Code. The Respondent's position, however, is that the building was unfit for human habitation and must now comply with current minimum residential standards for new construction. To meet the Code requirements with respect to the application for the new permit, in his opinion, would be to comply with Parts 9 and 7 of the OBC, as the residential use was discontinued over 10 years ago.

4. Provisions of the Ontario Building Code

Article 11.3.1.1. Material Alteration or Repair of a Building System

(1) Where an existing *building system* is materially altered or repaired, the *performance level* of the *building* after the material alteration or repair shall be at least equal to the *performance level* of the *building* prior to the material alteration or repair.

Article 11.3.3.1. Basic Renovation

(1) Except as provided in Sentence (2) and Article 11.3.3.2., *construction* may be carried out to maintain the existing *performance level* of all or part of an existing *building*, by the reuse, relocation or extension of the same or similar materials or components, to retain the existing character, structural uniqueness, heritage value, or aesthetic appearance of all or part of the *building* if, the *construction* will not adversely affect the early warning and evacuation systems, fire separations, the structural adequacy or create an unhealthy environment in the *building*.

5. Applicant's Position

The Applicants advised that they purchased the subject property in 1997 and proceeded to clean and repair the existing dwelling for use as their principal residence. They were unaware of the outstanding works orders associated with this property as a result of an omission in the search conducted by their lawyer. At the time of purchase they were advised by their legal counsel that there were no leans or encumbrances against the property. When they personally inspected the property, prior to purchase, they submitted that there were no notices posted on or near the building that would have alerted them to the outstanding orders.

The Applicants stated that, from 1997 to 1999 they cleaned up the house, repaired windows, walls, replaced fixtures, etc. to make it a livable dwelling. At no time during this period were they approached by the municipality or ordered to stop the work they were undertaking. When questioned about why they had not applied for a permit for the work they were undertaking on the building, the Applicants replied that, in their opinion, nothing was being done to the dwelling that would have normally required a building permit. They were primarily cleaning, painting and carrying out limited repairs to a structure that was already in existence.

It was not until after they moved into the house in 1999 and applied to the municipality for a building permit to reconstruct the garage that they were advised of any concerns with respect to the dwelling unit. The Applicants submitted that, at that time, they were provided with a list of alleged deficiencies that the municipality expected to be remedied to satisfy the outstanding work orders. The Applicants proceeded to apply for a permit for work undertaken on the residential building and met with municipal officials in an attempt to alleviate their concerns.

The deficiencies listed by the municipality as part of the permit approval would require compliance with Parts 7 and 9 of the Building Code. The Applicant's argued that, since the dwelling has been in existence since 1920, they cannot reasonably be expected to comply, nor are they required to comply, with current Building Code standards. The work undertaken, they submitted, should be considered under Part 11 of the Code as repair or renovation and those are the standards that should apply, not the current Code requirements for new construction outlined in Parts 7 and 9 as the municipality is insisting.

6. Respondent's Position

The Respondent submitted that he has been involved in this matter for a considerable amount of time. His initial involvement in the 1980s, came as a result of complaints to Council about the derelict building on the subject property. He advised that, upon inspection at that time, it was noted that the building had been vandalized; there was debris and broken glass throughout the dwelling and the basement was flooded. In September 1995, the municipality issued an Order to Remedy an Unsafe Building and an Order Prohibiting the Use or Occupancy of an Unsafe Building. These orders were issued to the previous owner and a copy was provided to the mortgage holder. In addition, the orders were posted on the building itself deeming the dwelling to be unsafe and prohibiting occupancy. The following site conditions were outlined in the orders:

- vandalized building
- broken door, windows and furniture
- animals living inside the dwelling
- foundation/basement flooded and full of debris
- building is open to the elements
- broken glass everywhere, and
- rotten front porch steps and floor

As a result of these conditions the Respondent considered the building to be uninhabitable. He was unaware, at the time, of the subsequent sale of the property but emphasized that the onus was on the purchaser to do a complete search to uncover any outstanding orders.

The Respondent confirmed the chronology of events leading up to this dispute and maintained that the itemized list provided as Schedule "A" to the building permit is, in his opinion, what would be required for a building compliance permit and occupancy permit to be issued. The Respondent defended the list of requirements identified in that schedule and submitted that "(t)he building was in very poor condition and unsuitable for human habitation. The building should have been used as an accessory building such as for storage or a work shop and a new residence constructed. The derelict building was renovated without permits or approvals."

The Respondent continued by submitting that "(t)his is a new issue. Not one that should be 'grand-fathered'. The residential use of this building was discontinued at least ten years ago. The building should be made to comply with Sections 9 & 7 of the Ontario Building Code as per Schedule 'A' attached to the Building Permit. The purchaser changed the use of the building from derelict, vacant and uninhabitable to residential."

When questioned whether he had conducted a recent inspection of the property, the Respondent stated that he had been advised by legal counsel against such an inspection. Schedule "A" was developed in relation to the permit application. He submitted that the work undertaken, although not inspected, must constitute a major renovation given the previous condition of the dwelling. The municipality, he stated, does not condone people living in derelict buildings. Safety and liability are an issue in this situation.

7. Commission Ruling

It is the decision of the Building Code Commission that the work undertaken on the existing house constitutes repair or renovation in accordance with Articles 11.3.1.1. and Sentence 11.3.3.1.(1) of the Ontario Building Code for the property located at Part of Lot 8, Concession 6 in the Township of Stanhope, Ontario.

8. Reasons

i) The building in question is an existing house constructed in 1920. It has, therefore, been in existence for more than 5 years. The house remained vacant for several years. The present owners bought the property in 1997 and proceeded to clean up and repair an existing house. Any such renovation or construction shall therefore take place in accordance with Part 11 of the OBC.

ii) The building is still considered an existing residential structure and therefore subject to Part 11 even thought it was vacant and unused for several years.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Sentence 3.8.3.3.(14) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Fraser Wilson, OMNI Health Care, Peterborough, Ontario for the resolution of a dispute with Ms Catherine Junop, Director, Building Services, City of Ottawa, Ontario to determine whether the as-installed paired corridor doors containing vision panels and which form part of the fire separation, are held open by magnetic hold open devices and are considered part of the barrier-free path of travel, provide sufficiency of compliance with Sentence 3.8.3.3.(14), regarding vision panels at the Kanata Long Term Care Residence, Campeau Blvd., Ottawa, Ontario.

APPLICANT	Mr. Fraser Wilson OMNI Health Care Peterborough, Ontario
RESPONDENT	Ms Catherine Junop Director Building Services City of Ottawa
PANEL	Mr. Len King, Chair Mr. Michael Steele Mr. Fred Barkhouse
PLACE	Toronto, Ontario
DATE OF HEARING	June 7, 2001
DATE OF RULING	June 7, 2001
APPEARANCES	Ms Gail E. Lamb Gail E. Lamb Incorporated Architect Lucan, Ontario **Agent for the Applicant** Mr. Tim Stewart Building Official City of Kanata **Designate for the Respondent**

RULING

1. The Applicant

Mr. Fraser Wilson, OMNI Health Care, Peterborough, Ontario, has received a building permit under the Building Code Act, 1992 and has constructed a building known as the Kanata Long Term Care Residence, Campeau Blvd., Ottawa, Ontario.

2. Description of Construction

The Applicant has constructed a long term care facility, having a building height of 5 storeys and a building area of 1, 958 m^2 according to the Applicant or 1, 619 m^2, according the Respondent. The facility is classified as a Group B, Division 2, care and treatment occupancy. It is of noncombustible construction and is equipped with a sprinkler system, a fire alarm system and a standpipe and hose system.

There are paired doors throughout the building that provide a double egress, separating the bedrooms of the facility from the common areas on floors two through five. During regular operation all of the doors are held open by magnetic hold open devices that are activated by the fire alarm system. Upon activation, the magnetic hold open devices release and the doors are closed forming a fire separation across the bedroom corridors.

The construction in dispute involves the vision panels that have been installed on the corridor doors that are located in a barrier-free path of travel. Within each door the Applicant has installed a 254 mm x 254 mm (10" x 10") vision panel, the bottom of which is located approximately 1, 524 mm (5 ft) above the finished floor. The Applicant's intent upon installing the vision panels was to provide a clear line of site for staff and firefighters to assist in the evacuation of the facility.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the paired corridor doors, forming part of the fire separation and located within the barrier-free path of travel, provide sufficiency of compliance with Sentence 3.8.3.3.(14) of the Building Code.

According to Sentence 3.8.3.3.(14), where vision panels are provided in a door located within a barrier-free path of travel, the panel shall be at least 75 mm wide, located not more than 900 mm above the finished floor and not more than 250 mm from the latch side of the door. It should be noted, however, that the Code does not require vision panels as an element of a barrier-free path of travel.

In this instance, the doors in question are located within the barrier-free path of travel and have been installed 1,524 mm (5 ft) above the finished floor. The doors remain open by use of magnetic hold open devices during normal operation of the facility and would be closed only during a fire alarm situation.

4. Provisions of the Ontario Building Code

Sentence 3.8.3.3.(14)

(14) Where a vision panel is provided in a door in a *barrier-free* path of travel, such panel shall be at least 75 mm (3 in) in width and be located so that

(a) the bottom of the panel is not more than 900 mm (2 ft 11 in) above the finished floor, and

(b) the edge of the panel closest to the latch is not more than 250 mm (9 7/8 in) from the latch side of the door.

5. Applicant's Position

The Agent for the Applicant submitted that the corridor doors, located at two locations on floors two through five, provide a double egress between the sleeping quarters and the common areas of the facility. The doors are held open by magnetic hold open devices and closed only during a fire alarm situation. The push plates to activate the doors are located on one side only with travel through the corridors being on the right side. There is a light located over the active side of the door.

In her submission, the Agent stated that this is not a normal path of travel in the traditional sense. Residents of the facility would not be expected to open the doors in any instance. On the occasion of an evacuation, residents would be assisted from the building by staff members and, during routine operation, the doors will remain open providing a barrier-free path of travel.

She noted that vision panels are not a requirement of the Building Code. In this instance they have been provided at the request of the Fire Department. They would serve the purpose of assisting both staff and firefighters in viewing the corridors during an evacuation situation. To facilitate this, the panels have been located at eye level for an average firefighter. She stated that, if the vision panels were to be removed, the Fire Department may have concern with respect to their abilities in an emergency situation.

6. Respondent's Position

The Designate for the Respondent submitted that he has a concern with respect to the double egress doors in question. He suggested that individuals using a wheelchair and operating the active leaf of the doorway would be located in a position that would block the inactive leaf. For increased safety, he argues, the vision panels should be provided in accordance with the strict wording of the Code and located no higher than 900 mm from the finished floor. This would allow those using a wheelchair to see through to the other side of the doorway.

In response to the assertion by the Agent for the Applicant that the doors are only closed during a fire situation, the Designate advised that the doors will be closed during any alert signal; whenever an initiating device has been activated. The vision panels, he argued, should be available for use by any individual using the door. Given that this is a B2 occupancy, a higher number of wheelchair users could reasonably be expected to traverse these corridors. In addition, visitors to the facility may also require barrier-free access. Magnetic hold open devices, he submitted, are not sufficient to ensure that accidents are avoided.

The Designate recognized that the Code does not require vision panels in a barrier-free path of travel but submitted that, where the designers determine that panels are needed, they must comply with the OBC requirements. He suggested that it may be beneficial if the intent of vision panels, and when they should be provided, are clarified in the Code.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-installed paired corridor doors containing vision panels and which form part of the fire separation, are held open by magnetic hold open devices and are considered part of the barrier-free path of travel, provide sufficiency of compliance with Sentence 3.8.3.3.(14) of the Ontario Building Code at the Kanata Long Term Care Residence, Campeau Boulevard, Ottawa, Ontario.

8. Reasons

i) The vision panels are not required by the Ontario Building Code
ii) The vision panels increase the level of safety in the building by assisting firefighters in the event of a fire.
iii) The doors are held open in the normal use of the building by the magnetic hold open devices.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Article 3.2.2.40. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Ms. Diane Roy, Hilltop Manor Nursing Home, Cambridge, Ontario, for the resolution of a dispute with Mr. Larry Simonato, Director of Building and By-law Enforcement, City of Cambridge, Ontario, to determine whether the 72 m^2 (775 ft^2) addition to the existing unsprinklered care and treatment occupancy that is also proposed to be unsprinklered provides sufficiency of compliance with Article 3.2.2.40. of the Ontario Building Code at the Hilltop Manor Nursing Home, 42 Elliot Street, Cambridge, Ontario.

APPLICANT	Ms. Diane Roy Hilltop Manor Nursing Home Cambridge, Ontario
RESPONDENT	Mr. Larry Simonato Chief Building Official City of Cambridge
PANEL	Dr. Kenneth Peaker, Chair Mr. Robert De Berardis Mr. Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	May 24, 2001
DATE OF RULING	May 24, 2001
APPEARANCES	Ms. Gail Lamb Gail E. Lamb Incorporated Architect Lucan, Ontario **Agent for the Applicant** Mr. Larry Simonato Chief Building Official City of Cambridge **The Respondent**

RULING

1. The Applicant

Ms. Diane Roy, Hilltop Manor Nursing Home, Cambridge, Ontario has applied for a building permit under the Building Code Act, 1992 for the construction of a proposed 72 m^2 (775 sq ft) unsprinklered addition to an existing unsprinklered care and treatment facility at the Hilltop Manor Nursing Home, 42 Elliot Street, Cambridge, Ontario.

2. Description of Construction

The Applicant is the operator of a nursing home having a building height of two storeys and a building area of approximately 1241.28 m^2 (13, 361 sq ft). The facility is classified as a Group B, Division 2 - care and treatment occupancy and is equipped with a fire alarm system. The existing building is of noncombustible construction and is not sprinklered.

The construction at dispute involves a proposed 72 m^2 addition to the nursing home. The addition would contain administration offices in the basement level, dining room facilities for residents of the nursing home on the first and second floors and a sitting room at the second storey level. The doors from the addition to the corridors of the existing building are proposed to have electromagnetic hold open devices activated by activation of the smoke detection system. The addition in question will also be of noncombustible construction and is not proposed to be sprinkled. The total building area, including the proposed addition, would be 1313.28 m^2 (14, 136 sq ft).

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed unsprinklered addition to the existing unsprinklered nursing home provides sufficiency of compliance with Article 3.2.2.40. of the Ontario Building Code (OBC).

Article 3.2.2.40.(1)(a) requires that, except as permitted by Sentence 3.2.2.7.(1) (not applicable here), a Group B, Division 2 or Division 3 occupancy must be sprinklered. The nursing home facility is classified as a Group B, Division 2 major occupancy. The addition being contemplated will have the same classification. Despite this classification, the addition is proposed to be unsprinklered. The existing building is also unsprinklered as it was constructed prior to 1976 when sprinklering was not a Code requirement. In all other respects, the proposed addition meets the requirements of the OBC.

4. Provisions of the Ontario Building Code

3.2.2.40. Group B, Division 2 or Division 3, up to 2 Storeys, Sprinklered

(1) A *building* classified as Group B, Division 2 or Division 3 is permitted to conform to Sentence (2) provided

(a) except as permitted by Sentence 3.2.2.7.(1), the *building* is *sprinklered*,

(b) it is not more than 2 *storeys* in *building height*, and

(c) it has a *building area* not more than

(i) 2 400 m^2 (25,800 ft^2) if 1 *storey* in *building height*, or

(ii) 1 600 m^2 (17,200 ft^2) if 2 *storeys* in *building height*.

(2) The *building* referred to in Sentence (1) is permitted to be of *combustible construction* or *noncombustible construction* used singly or in combination, and

(a) floor assemblies shall be *fire separations* with a *fire-resistance rating* not less than 45 min,

(b) *mezzanines* shall have, if of *combustible construction*, a *fire-resistance rating* not less than 45 min, and

(c) *loadbearing* walls, columns and arches shall have a *fire-resistance rating* not less than that required for the supported assembly.

5. Applicant's Position

The Agent for the Applicant submitted that, while it is clear that Group B, Division 2 occupancies are to be sprinklered, the Building Code makes no provision for small additions to presently unsprinklered buildings. The addition in question is only 72 m^2 and of noncombustible construction. It is not intended as living quarters for any of the residents and will be used for administration offices, dining facilities and a sitting room. The Agent advised that there will be no additional fire load, nor will the proposal facilitate an increase to the occupant load. In fact, the Commission was advised that the occupancy for the home was being reduced from 102 to 89 residents.

The Applicant went on to advise that the proposed addition will add quality of life for the residents of the facility. The dining room area is currently located in the basement of the existing building. This causes inconvenience to staff and residents at meal times when all occupants must be transported from the first and second floors to the basement level. The addition in question will eliminate this procedure as residents would be able to dine on the floor level where they reside. The dining rooms would not contain any cooking equipment and would be provided with only with a fridge and sink. Pre-prepared food would be transported from the basement kitchen to the proposed dining areas for service.

It was the Applicant's argument that the sprinklering of this small addition to an existing unsprinklered building would not enhance life safety for the occupants of this facility. The addition is of noncombustible construction and the Fire Marshall has reviewed the plans and advised that he is satisfied that the proposal would not require that sprinklers be added. As a measure to compensate for the lack of sprinklering, the Applicant is prepared to ensure a one-hour fire separation of masonry construction between the existing building and the proposed addition. This measure would be in addition to the electromagnetic hold open devices that are proposed for doors from the addition to the corridors (a feature which would also exceed OBC requirements).

6. Respondent's Position

The Respondent submitted that, while they acknowledge the relatively small size of the addition, the Code requires mandatory sprinklering in this instance. There is no provision in the Code that would permit them to waive this requirement regardless of the size of the addition.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed 72 m^2 unsprinklered addition to the existing unsprinklered care and treatment occupancy provides sufficiency of compliance with Article 3.2.2.40. of the Ontario Building Code at the Hilltop Manor Nursing Home, 42 Elliot Street, Cambridge, Ontario on condition that:

a) The Applicant provide electromagnetic hold open devices with proper detection on the corridor doors of the proposed addition.
b) The Applicant confirms that the wall between the existing and new construction is masonry, providing a one-hour fire separation, or, that a masonry wall will be constructed at this location having a one-hour fire separation rating.

8. Reasons

i) There will be no increase in occupant loading as a result of the addition. A reduction in occupancy from 120 to 89 residents is expected.
ii) Both the existing building and the proposed addition will be of noncombustible construction.
iii) The individual rooms, suites and corridors are provided with a fire separation of masonry construction.
iv) There is supervisory and nursing staff on site.
v) The facility has an existing fire alarm system.

APPEARANCES	Mr. Norbert Sebris Consultant Toronto, Ontario **Agent for the Applicant** Mr. Sait Toprak Manager, Plan Review, West District City of Toronto **Designate for the Respondent**

RULING

1. The Applicant

Mr. Gabriel Costa, President, Costa & Gunnar Construction Inc., Toronto, Ontario, has applied for a building permit under the Building Code Act, 1992 for the construction of a new mezzanine in Unit # 2, 30 Titan Road, Toronto, Ontario.

2. Description of Construction

The Applicant represents the owner of several units within an existing mixed use industrial condominium building, containing a Group F, Division 2, industrial major occupancy. The facility is one storey in building height with an area of approximately 6,473.76 m^2 (69, 683 sq ft). It is comprised of noncombustible construction and has been provided with a fire alarm system and is fully sprinklered.

The construction in dispute involves a proposed mezzanine addition to Unit #2. The unit has an area of approximately 451.42 m^2 (4,859 sq ft) and the mezzanine is proposed to be approximately 114.87 m^2. It is contemplated that the mezzanine will run along the extent of the western wall of the unit, providing headroom clearance of ,1975 mm (6', 6") under the 457.21 mm (18 inch) open web steel joists located every 1,975 mm (6', 6").

A printing business is currently operated out of Unit #2 and it is anticipated that the proposed mezzanine level would be used by the graphic arts designers. It is suggested that 3 to 5 people would occupy the mezzanine level and there would be no partitions to obstruct movement or view.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the minimum headroom clearance proposed for the mezzanine level at 1,975 mm (6', 6") provides sufficiency of compliance with Articles 3.3.1.8. and 3.4.3.6. of the Ontario Building Code.

With two exceptions not applicable here, Article 3.3.1.8. requires compliance with Article 3.4.3.6. in respect to the minimum headroom clearance required in every access to exit.

Article 3.4.3.6 requires that every exit shall have a minimum headroom clearance of 2,100 mm (6', 11"). In this instance the Applicant is providing headroom clearance at the open web steel joists of only 1,975 mm (6', 6"). Although the coffered ceiling between the joists offers headroom clearance that would exceed Code requirements, compliance is not achieved at each joist location throughout the subject unit.

4. Provisions of the Ontario Building Code

3.3.1.8. Headroom Clearance

(1) Except within the *floor area* of a *storage garage*, the minimum headroom clearance in every *access to exit* shall conform to the requirements of Article 3.4.3.6. for *exits*. (See also Sentence 3.3.5.4.(5).)

3.4.3.6. Headroom Clearance

(1) Except as permitted by Sentences (2) to (4), every *exit* shall have a headroom clearance of

not less than 2,100 mm (6 ft 11 in).

(2) The headroom clearance for stairways measured vertically above any landing or the nosing of any stair tread shall be not less than 2,050 mm (6 ft 9 in).

(3) The headroom clearance for doorways shall be not less than 2,030 mm (6 ft 8 in).

(4) No door closer or other device shall be installed so as to reduce the headroom clearance of a doorway to less than 1,980 mm (6 ft 6 in).

5. Applicant's Position

The Applicant's Agent submitted that the design of the proposed mezzanine is based on permit drawings for Unit #8 that were submitted to the City in 1977. The mezzanine design in Unit #8 was based on the provision of 6', 6" of headroom at the open web steel joists that run throughout the building. In addition to Unit #8, the owner has since purchased Units 6, 10, 12 and, most recently, Unit #2. Units 6, 10 and 12 also have mezzanines that provide 6', 6" of headroom clearance. The mezzanines in these units were constructed by previous tenants prior to the current ownership. In addition to the five units currently owned by the this company, the owner anticipates purchasing Unit #4 and constructing a similar mezzanine; he has a verbal agreement with the present owner of Unit #4 with respect to this prospective purchase. The owner's future intent is to merge all 6 units for the purpose of operating his printing business.

The Applicant's Agent acknowledged that, while it may be possible to comply with the Code requirements, it would be desirable to have a continuous mezzanine at the same level throughout all units owned by his client. This would avoid the 5 inch drop that would occur from the as-constructed mezzanines in the other units to the mezzanine proposed in Unit #2. He suggested that it would be preferable, from a safety standpoint, to obtain a uniform floor level for all mezzanines. He stated that this 5 inch differential in floor level may cause people to stumble down the stair or ramp once all units had been merged. This may prove more dangerous than the reduction in headroom at certain locations throughout the unit.

In addition to his concern over the lower floor grade on the mezzanine level, the Agent submitted that the ceiling height on the main floor would also be affected. He stated that it would be the owner's preference to obtain a maximum ceiling height for the office and client reception areas on the ground floor. When questioned, the Agent acknowledged that it would be structurally possible to address the first floor ceiling height concern with appropriate building material and design.

In summation, the Applicant's Agent concluded that the building offers a significant level of safety given the required sprinklering, smoke detection and alarm systems in place. Safety to the occupants of the mezzanine level would more affected by the eventual floor level grade change, or stepping down between units, than by the reduction of headroom that would occur at the open web steel joists located every 6', 6" across the unit.

6. Respondent's Position

The Designate for the Respondent submitted that the Building Code is clear in requiring a minimum headroom of 6', 11' in this instance. He questioned whether the City had, in fact, issued a building permit for Unit #8 in 1977 with a 6', 6" headroom. He advised the Commission that a search of the City's records uncovered no such permit. He went on to acknowledge that the City could not, at this point, require changes to the as-constructed mezzanines in the other units, however, consideration of the headroom issue in Unit #2 stands alone in this application.

The Designate submitted that the Applicant did not presently own Unit #4, located between Unit #6 and Unit #2, however, if all units were eventually connected, the difference in floor grade could be addressed. He suggested that a ramp could be provided at a 1:8 ratio since this is not a barrier free situation.

The Designate expressed concern with the safety of a 5 inch reduction in headroom on the mezzanine level. He stated that the Code requirement of 6', 11" is relatively new and suggested that there is no justification to vary the requirement in this instance. In his opinion, taller individuals would have difficulty exiting the mezzanine level in an emergency situation. There are many joists to consider and people may not always be aware of their location as they would with a doorway, where the headroom is expected to be reduced.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed construction of a new mezzanine in the existing building that is to provide a minimum headroom clearance of 1,975 mm (6', 6") under the open web steel joists located at 1,975 mm (6', 6") on centre does not provide sufficiency of compliance with Articles 3.3.1.8. and 3.4.3.6. of the Ontario Building Code at Unit #2, 30 Titan Road, Toronto, Ontario

8. Reasons

i) The mezzanine, as proposed, does not comply with the intent of the Code.

ii) The Applicant has offered no measure of compensation in order to achieve sufficiency of compliance.

iii) Design alternatives are available that would enable the Applicant to comply with the Code requirements.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Article 9.5.2.1. and Clause 3.8.1.1.(1)(c) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Jack Feldman, Director, Camp George, Thornhill, Ontario, for the resolution of a dispute with Mr. Wib Bethune, Chief Building Official, Township of Seguin, Ontario, to determine whether the proposed seasonal-use sleeping cabins are required to be barrier-free accessible, when considering Article 9.5.2.1. and Clause 3.8.1.1.(1)(c) of the Ontario Building Code at the Union of American Hebrew Congregations - Camp George, Township of Seguin, Ontario.

APPLICANT	Mr. Jack Feldman, Director Camp George Thornhill, Ontario
RESPONDENT	Mr. Wib Bethune Chief Building Official Township of Seguin
PANEL	Dr. Kenneth Peaker, Chair Mr. Fred Barkhouse Mr. John Guthrie
PLACE	Toronto, Ontario
DATE OF HEARING	April 26th, 2001
DATE OF RULING	April 26th, 2001
APPEARANCES	Mr. Les Muniak, Principal Larden Muniak Consulting Inc. Toronto, Ontario **Agent for the Applicant** Mr. Peter Shoebottom Deputy Chief Building Official Parry Sound, Ontario **Designate for the Respondent**

RULING

1. The Applicant

Mr. Jack Feldman, Director, Camp George, Thornhill, Ontario, has applied for a building permit under the Building Code Act, 1992 for the construction of four additional sleeping cabins at the facility known as the Union of American Hebrew Congregations - Camp George, Township of Seguin, Ontario.

2. Description of Construction

Camp George currently operates as a youth camp facility, providing summer activities in a woodland setting. The organized camping activities provided are available to children of various ages. Accommodations at Camp George currently consist of two clusters of sleeping cabins with four cabins in each cluster. At present, one cabin per cluster is barrier-free accessible.

The Applicant is proposing an expansion of the existing facility which would include the construction of four additional cabins. The facility is classified as a Group C residential major occupancy. The individual cabins are one storey in building height and built of combustible construction. Each cabin is considered as a separate building and will have an area of approximately 95 m^2.

The construction in dispute involves the accessibility of the proposed cabins. As noted, four additional sleeping cabins are proposed; two in each existing cluster. Of those four new cabins, two are proposed to provide barrier-free access; one in each cluster. As a result, a total of two barrier-free accessible cabins will be provided in each of the two clusters.

Access to the barrier-free cabins will be by a ramp, whereas access to the other cabins will be by stairs. The sleeping cabins, whether barrier-free or not, will contain eight single beds and four bunk beds. The maximum number of occupants per cabin would be 16 persons. The washrooms in the barrier-free cabins provide one large stall and one regular stall. In addition, a barrier-free shower would be provided in a separate room. The non barrier-free cabins would have two regular washroom stalls and two non-barrier free showers.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether all four cabins proposed in the anticipated expansion are to be made barrier-free accessible when considering Sentence 9.5.2.1.(1) and Clause 3.8.1.1.(1)(c) of the Ontario Building Code.

Sentence 9.5.2.1.(1) requires that every building be designed to comply with the provisions outlined in Section 3.8. in respect to barrier-free access. Section 3.8. requires, with certain exceptions, that all buildings be designed with barrier-free access and outlines the provision of such design. Clause 3.8.1.1.(1)(c), however, states that buildings that are not intended to be occupied on a daily or full time basis are exempt from the provisions of 3.8.

In this case, each cabin is considered a separate building while only two of the four proposed cabins to be constructed will provide barrier-free access. However, Camp George is a seasonal operation, providing camping facilities and accommodation throughout the summer months only. The cabins, both proposed and existing, are not winterized. The Building Code is unclear as to whether the type of buildings being proposed would fall under the exemption noted in Clause 3.8.1.1.(1)(c).

4. Provisions of the Ontario Building Code

9.5.2.1. General

(1) Except as provided in Sentence (2) and Article 3.8.1.1., every *building* shall be designed in conformance with Section 3.8.

3.8.1.1. Application (See Appendix A.)

(1) The requirements of this Section apply to all *buildings* except
(c) *buildings* which are not intended to be occupied on a daily or full time basis, including automatic telephone exchanges, pumphouses and substations.

5. Applicant's Position

The Agent for the Applicant outlined the nature of the construction anticipated, advising that his client is proposing to construct cabins that would provide sleeping accommodation at a recreational camp. The cabins are organized into clusters of six; three for girls and three for boys. One of the girls and one of the boys cabins are proposed to be barrier-free accessible. There would be two clusters of this type at Camp George for a total of twelve cabins at the facility; four providing barrier-free access. Of those twelve, eight cabins already exist. The existing cabins were built by the Applicant a few years ago, and at that time only two of the eight were required by the municipality to be barrier-free.

The Agent continued by explaining that the terrain at the camp is an issue in the provision of barrier-free access to each of the cabins. The cabins are located in a rugged, natural setting. The ramps required to access each cabin are 4 ft wide and roughly 60 ft in length. This would create a total of 240 sq. ft. of ground cover.

The Agent acknowledged that Section 9.5.2.1. of the Ontario Building Code requires that all buildings be barrier-free accessible. He also stated that this proposal may not fall under the exemptions outlined in Clause 3.8.1.1.(1)(c). In support of his position however, the Agent submitted, that Section 9.36. dealing with cottages and outlining requirements for seasonal accommodation, may apply in this instance. The cabins at Camp George provide seasonal accommodations for a recreational use. He argued that it was unclear from the provisions of the Building Code, whether the cabins should be considered seasonal recreational by virtue of their design or by the function of the camp. The Agent put forth the argument that, if the cabins can be considered under the provisions of Section 9.36.1.1.(1), then the Applicant has already, voluntarily, exceeded the Code requirements with the existence of even one barrier-free cabin. Buildings constructed in accordance with 9.36.1.1.(1) need not comply with the barrier-free access provisions outlined in Section 9.5.

6. Respondent's Position

The Designate for the Respondent submitted that it is his understanding that Section 9.5. applies in this instance. The provisions outlined in this Section would require that all buildings be barrier-free accessible. In response to the Applicant's suggestion regarding the application of the provisions of Section 9.36., he submitted that, while the buildings may be seasonal and/or recreational, they are also considered tourist accommodation and would, therefore, fall under the specific provisions of Subsection 9.36.3.

Under the provisions of 9.36.3.1.(1), buildings that are intended to be used for seasonal tourist accommodation or are for rent, would be subject to the provisions of Section 9.5. and, therefore, must be barrier-free. In that regard, the Respondent submitted that, since the campers pay a fee for food, accommodation, use of the facilities, etc., and since they are in the area for a limited period of time, they should be considered tourists. He submitted that the definition of tourist and camper may overlap somewhat and he sought some direction from the Building Code Commission as to what might apply in this instance.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed seasonal-use sleeping cabins are not required to be barrier-free accessible, when considering Article 9.5.2.1. and Clause 3.8.1.1.(1)(c) of the Ontario Building Code at the Union of America Hebrew Congregations - Camp George in the Township of Seguin.

8. Reasons

1. This camp is not a tourist facility; it is a recreational residential use, therefore, barrier-free access provisions do not apply.

Dated at Toronto this **26th,** day in the month of **April,** in the year **2001** for application number **2001-23.**

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Sentence 8.2.1.3.(4) and Table 8.2.1.3.B. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Mike Feld, Manager of Store Development, Sobeys Properties Ltd., Mississauga, Ontario, for the resolution of a dispute with Mr. Dave Tantalo, Sewage System Inspector, Renfrew County and District Health Unit, Pembroke, Ontario, to determine whether the proposed Sobeys IGA supermarket that is to contain a delicatessen, a bakery, and a meat department is a listed occupancy under Table 8.2.1.3.B. (forming part of Sentence 8.2.1.3.(2)), or whether it is permitted to comply with Sentence 8.2.1.3.(4) of the Ontario Building Code at Lot 19, Concession IX, Township of North Algona-Wilberforce, Ontario.

APPLICANT	Mr. Mike Feld, Manager of Store Development Sobeys Properties Ltd. Mississauga, Ontario
RESPONDENT	Mr. Dave Tantalo Sewage System Inspector Renfrew County & District Health Unit
PANEL	Mr. Bryan Whitehead, Chair Mr. Frank Wright Mr. Doug Robinson
PLACE	Toronto, Ontario
DATE OF HEARING	April 12th, 2001
DATE OF RULING	April 12th, 2001
APPEARANCES	Mr. Tom Jones, Civil Technologist McIntosh Perry Consulting & Engineers Carp, Ontario **Agent for the Applicant** Mr. Mike Klatt Supervisor, Sewage System Inspections Pembroke, Ontario **Designate for the Respondent**

RULING

1. The Applicant

Mr. Mike Feld, Manager of Store Development for Sobeys Properties Ltd., has applied for a building permit under the Building Code Act, 1992 for the construction of a Sobeys IGA supermarket, containing a delicatessen, a bakery, and a meat department on lands comprising Part Lot 19, Concession IX, in the Township of North Algona-Wilberforce, Ontario.

2. Description of Construction

The Applicant is proposing to construct a grocery store, including a delicatessen, bakery, and meat department, having a total finished floor area of 2,347 m^2. The slope of the site is 2% with a 20 metre depth to the hardpan. The soil on which the sewage system will be located consists of imported fill providing a percolation time of 10 minutes per centimetre. The sewage facility itself is described as a Class 4 system equipped with a Waterloo Biofilter tertiary treatment unit and a Nitrex filter installed at the output end of the tank. The leaching bed will have an area of 105 m^2. Water will be supplied to the building from a drilled well.

The construction in dispute involves the daily design sewage flow for the proposed sewage system. The Applicant in indicating an output of 9,000 L/day will be produced. This design is based on water records obtained from several similar establishments. These records indicate that the daily flow does not exceed 4,600 L/day. The applicant is proposing to almost double this figure, providing, in his opinion, a 100% margin for safety on high use days. In addition, a monitoring program will be implemented to further ensure that the daily design flow is not being surpassed.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed Sobeys IGA supermarket that is to contain a delicatessen, a bakery, and a meat department is a listed occupancy under Table 8.2.1.3.B. (forming part of Sentence 8.2.1.3.(2)), or whether it is permitted to comply with Sentence 8.2.1.3.(4) of the Ontario Building Code.

Table 8.2.1.3.B. forms part of Sentence 8.2.1.3.(2) and provides values for the total daily design flow for occupancies other than those residential occupancies listed in Table 8.2.1.3.A. Table 8.2.1.3.B. provides a number of classifications including Food Service Operations. As part of the Food Service Operations category, the Table provides separate daily design flow volumes for both floor areas of food outlets that do not include delis, bakeries or meat departments and for floor areas that do contain these services.

Sentence 8.2.1.3.(4), on the other hand, provides that, for occupancies not listed in Table 8.2.1.3.B., metered data from at least three similar establishments can be used to determine the total daily design sanitary sewage flow expected to be generated by a given occupancy. In this case, the Applicant is proposing a grocery store use which will include a delicatessen, bakery and meat department.

The Applicant agues that, although the use appears to be classified in Table 8.2.1.3.B. as a Food Service Operation that includes a bakery, delicatessen and meat department, if the table values are used, the expected daily flow would be in excess of 20,000 L/day. Even using the category of Store from the Table, given the floor area of this building, a yield of 11,600 L/day would be produced. In the

Applicant's opinion, these figures do not accurately represent the expected flow production for the site. As a result, his position is that Sentence 8.2.1.3.(4) applies in this instance and the daily design flow may be based on the average daily flow calculations from similar grocery store operations. The Respondent disagrees with this assertion. In his view, the proposed use is clearly anticipated under the Food Service Operation category within Table 8.2.1.3.B.

It should be noted that if the Commission determines that the use does fall within Table 8.2.1.3.B., and based on the flow calculations of approximately 20,000 L/day provided by both the Applicant and Respondent parties, an issue of jurisdiction is then raised for the BCC to consider. This is because the regulatory environment governing sewage systems and sewage works in Ontario is divided between Part 8 of the Ontario Building Code and Section 53 of the *Ontario Water Resources Act* (OWRA - a Ministry of Environment legislation). Each application of a proposed sewage system/work must be determined between these jurisdictional spheres. The jurisdictional divide is as follows:

The Ontario Building Code is the governing regulation for sewage systems (see definition below) that have a total daily design sanitary sewage flow (or design capacity [see definition below]) of 10,000 litres per day or less. Sewage works, subject to the requirements of S. 53 of the OWRA, on the other hand, are facilities that may include design capacities of greater than 10,000 litres per day[1]. For residential and other occupancies that are captured in Sentences (1) and (2) of Article 8.2.1.3. (Tables 8.2.1.3.A. and B respectively) the total daily design flow is the key factor determining design capacity which, in turn, dictates applicable jurisdiction. In this instance, design capacity may not be a measure of flows actually entering the ground (if certain dosing measures such as balancing are utilized), but is rather a calculation of potential or anticipated flows from a listed occupancy.

However, if the BCC determines that Sentence 8.2.1.3.(4) is applicable, the prescribed flows in the Tables are not relevant. As a result, metered data from other similar establishments becomes appropriate to establish the daily design sanitary sewage flow. If such data indicates that the anticipated flow to be less than 10,000 L/day there is likely no jurisdictional issue to consider.

4. Provisions of the Ontario Building Code

Article 1.1.3.2. Defined Terms

Design capacity, when used in the definition of the term *sewage system*, means total daily design *sanitary sewage* flow determined in accordance with Article 8.2.1.3.

Sewage system means (among other things)
(d) a *leaching bed* system
where these
(f) have a *design capacity* of 10,000 litres per day or less...

Sentence 2.1.1.14.(1) Sewage Systems

(1) Part 8 applies to the *construction*, operation and maintenance of all *sewage systems* and to

[1] It is significant to note that both regulatory regimes, OBC and OWRA (Clause 53(6)(c) use the subject Tables in the OBC as their point of divergence.

the *construction* of *buildings* in the vicinity of *sewage systems.*

Sentence 8.2.1.3.(2) Sewage System Design Flows

(2) For all other *occupancies*, the total daily design *sanitary sewage* flow shall be at least the value in Column 2 as determined from Table 8.2.1.3.B. (See Appendix A.)

Table 8.2.1.3.B.
Other *Occupancies*
Forming part of Sentence 8.2.1.3.(2)

Establishments	Volume (Litres)
Food Service Operations	
j) Food outlets (excluding delis, bakeries or meat departments	
i) per 9.25 m^2 of floor space,	40
ii) Per 9.25 m^2 of deli floor space,	190
iii) Per 9.25 m^2 of bakery floor space,	190
iv) Per 9.25 m^2 of meat department floor space, and	380
v) Per Water Closet	950

Sentence 8.2.1.3.(4) Sewage System Design Flows

(4) Where an *occupancy* is not listed in Table 8.2.1.3.B., the highest of metres flow data from at least 3 similar establishments shall be acceptable for determining total daily design *sanitary sewage* flow.

5. Applicant's Position

The Agent for the Applicant submitted that a "grocery store" use is not specifically addressed in the Code and that, by using the calculation from Table 8.2.1.3.B. for a "food outlet", the flow rate is unrealistically high. The rate of flow of 20,000 to 25,000 L/day that would be generated using the figures obtained from the Table, is an inaccurate reflection of the actual anticipated output. He argued, therefore, that Sentence 8.2.1.3.(4) may be applied in this instance. In support of this position, the Agent obtained metered data from several similar establishments, identifying a daily average flow of 4,500 litres. The empirical data that has been obtained from these other establishments is more representative, in his opinion, of the expected daily sanitary sewage flow.

Doubling this figure to 9,000 L/day, the Agent continued, establishes an acceptable margin of safety and thus a level of comfort could be provided for high use days. He further outlined that, because grocery stores are now open 7 days a week, there are no peak days to consider as part of the flow rate calculation.

When questioned on the issue of jurisdiction as a result of the level of estimated sanitary sewage flow, the Agent explained that the Health Unit and the Building Code Commission had the jurisdiction to consider this application as the daily design flow is, in his opinion, below 10,000 L/day. The construction, therefore, is mandated by the Ontario Building Code rather than the *Ontario Water Resources*

Act. He stated that staff at the Ministry of the Environment had advised him that they would not review the design of this system as it did not exceed the 10,000 litre per day threshold.

6. Respondent's Position

The Designate for the Respondent submitted that the intended grocery store use is defined in Table 8.2.1.3.B. as a "food outlet", with a delicatessen, bakery, and meat department. Sentence 8.2.1.3.(4) does not apply where the occupancy is listed in the Table. In addition, when using the calculations generated by Table 8.2.1.3.B., the total daily design flow exceeds 10,000 L/day, therefore the sewage system for this facility is not regulated under the Ontario Building Code. He argued that neither the Health Unit nor the Building Code Commission has the authority to consider this application.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed supermarket is a defined use as indicated in Table 8.2.1.3.B. Accordingly, based on the calculations, the flow rate exceeds 10,000 litres per day and the approval of the sewage system design is the responsibility of the Ministry of the Environment.

8. Reasons

i) The proposal, as a supermarket/grocery store with ancillary areas, in our opinion, is consistent with a "Food Service Operation" in Table 8.2.1.3.B.

ii) Based on the above, the calculation of the total daily design sanitary sewage flow will considerably surpass the 10,000 litre per day threshold articulated in the OBC.

Mr. Chris Bird
Manager of Plan Review
Markham, Ontario
Designate for the Respondent

RULING

1. The Applicant

Mr. Tom Dutton, Senior Vice President, The Daniels Corporation, Toronto, Ontario, has received a building permit under the Building Code Act, 1992 for the construction of an assisted living facility and senior's residential building known as the Renaissance at Swan Lake located at 6360 16th Avenue, Markham, Ontario.

2. Description of Construction

The Applicant has constructed a four storey building containing a Group B, Division 3 care occupancy on the first and second floors with a Group C residential occupancy on the third and fourth floors. The total building area is approximately 3,022 m^2. The entire building has been sprinklered and provided

with smoke detectors in the corridors. The structure is of noncombustible construction and includes a two hour rated fire separation between the second and third floors.

The construction in dispute involves the single stage fire alarm system proposed for the subject building. For the residential floors (third and fourth), hard-wired smoke alarms will be installed within each suite. It is intended that one smoke alarm within each suite will, upon actuation, be capable of sending a signal to an identification device located the concierge desk. The concierge will then, if necessary, be able to use the paging system to announce to the staff the specific suite in which the alarm occurred. The smoke alarms themselves, however, will be audible in the individual suites only.

In contrast, the B3 occupancy (first and second) floors will be provided with smoke detectors connected to the fire alarm system. Upon actuation of a specific smoke detector, a signal will be sent to the fire alarm control panel and an identification device. The identification device will then indicate the source of the signal at both the concierge's desk and the second floor nurse's station. In doing so, it will show the actual number of the room of the signal source. In addition, the Markham Fire Department will also be alerted. The signal they receive will indicate both the property address and the room number in which the alarm originated. The annunciating devices on these floors will provide a general alarm audible throughout the floors within the B3 occupancy.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the provision of a single stage fire alarm system provides sufficiency of compliance with Clauses 3.2.4.3(1)(b), (c) and (e) of the Ontario Building Code.

Sentence 3.2.4.3.(b) requires a two stage alarm system in a Group B occupancy however, Sentence 3.2.4.3.(c) permits a single stage system for Group B, Division 3 occupancies in buildings of three storeys or less. In addition, Sentence 3.2.4.3.(1)(e) provides that Group C residential occupancies are permitted to be served by a single stage fire alarm system.

As mentioned above, the building subject to this dispute is a total of four storeys in height, contains a B3 occupancy and is to provide only a single stage fire alarm system.

4. Provisions of the Ontario Building Code

Article 3.2.4.3. Types of Fire Alarm Systems

1. A fire alarm system shall be
    a. a single stage system in a Group F, Division 1 *occupancy*.
    b. a 2 stage system in a Group B *occupancy* other than those described in Clause (c).
    c. a single of 2 stage system in a *building 3 storeys* or less in *building height* which contains a Group B, Division 2 *occupancy*.
    d. a single stage system in elementary and secondary school, except for a special needs facility, and
    e. a single or 2 stage system in all other cases.

5. Applicant's Position

The Applicant submitted that the type of fire alarm system should reflect the level of hazard present. He advised that while a Group C occupancy permits a single stage system, a Group B, Division 3 occupancy in buildings exceeding three storeys would require a two stage alarm system. In this instance, however, the increased hazard level and risks associated with a B3 care facility only apply to the first and second floors. He advised that the occupants of the facility are not bedridden and are frequently evaluated (every three months) to determine whether their physical condition has deteriorated. The single stage system proposed, requiring the immediate evacuation of the building, is sufficient in this instance. There are emergency nursing personnel present 24 hours a day on the first and second floors to assist in evacuation and a Fire Safety Plan is being approved and has been implemented.

The Applicant continued that the building exceeds the Code requirements in a number of respects. There is an addressable system installed, providing voice communication speakers throughout the building. In addition, there are smoke alarms in the individual suites which provide annunciation at the second floor nurse's station and the concierge desk. There are also smoke detectors in the corridors and the building is fully sprinklered, as required by the Code.

In summation, the Applicant put forth the position that, as the increased hazard is only present on the first two floors, the Code requirements for Group B, Division 3 occupancies in buildings three storeys or less, which would require only a single stage system, should apply in this instance.

6. Respondent's Position

The Respondent submitted that the Code requirement reads that a two stage system is required in buildings exceeding three storeys, containing a Group B, Division 3 occupancy. They have no authorization to vary from the Code requirements.

Based on the Applicant's assurances with respect to the physical condition of the occupants, the Respondent indicated that they are satisfied there would be no unnecessary risk involved in the mandatory evacuation of the building required by a single stage alarm system, however the wording of the Code does not permit them to accept this proposal.

7. Commission Ruling

It is the decision of the Building Code Commission that the four storey building that is to contain a Group B, Division 3 occupancy on the first and second floors and a Group C occupancy on the third and fourth floors and is proposed to be equipped with a single stage fire alarm system provides sufficiency of compliance with Clauses 3.2.4.3(1)(b)(c) and (e) of the Ontario Building Code at the Renaissance at Swan Lake, 6360 16th Avenue, Markham, Ontario.

8. Reasons

i. Only the first and second floors contain a Group B, Division 3 occupancy, hence the risks associated with this type of use apply to only two storeys, not the entire four storey building.

ii. There will be no compromise to the level of safety present.

iii. The Fire Department agrees with the single stage alarm system.

iv. The first and second storey occupants are not bedridden or on life support systems and are evaluated every three months.

DATE OF RULING
April 12th, 2001

APPEARANCES
Mr. David Greenfield, President
D. Greenfield Associates Ltd.
Milton, Ontario
Agent for the Applicant

Mr. Paul Nickerson
Building Technologist
Burlington, Ontario
Designate for the Respondent

RULING

1. The Applicant

Mr. Gary Maddock, General Manager-Operations, Cango Inc., Burlington, Ontario, has applied for building permit under the Building Code Act, 1992 for the purpose of constructing a self-service gas bar and drive through kisok at 6783 Guelph Line, Part Lot 10, Con. 4 N.S., R.R. # 2, Milton, Ontario.

2. Description of Construction

The Applicant is proposing to construct a self-service gas bar with a kiosk containing a drive through window designed for the sale of take-out food items, including donuts, coffee, soft drinks, etc. The use has been classified as a Group E major occupancy. The total area of the building will be 120 m^2, with a portion dedicated to the drive through operation. With the exception of coffee, there will be no food preparation on site. The building design incorporates one water closet and a total of 8.5 plumbing fixture units. The gas bar will have two islands and 4 pumps that can service a maximum of eight (8) cars at any one time. There will be a total of two employees in the kiosk, one serving the gas bar patrons and the other providing service for the drive through. The building will be serviced by a private drilled well.

The site characteristics include a slope of 8% with a hardpan depth of 13.5 m and a depth of 10 m to the groundwater table. The soil on which the sewage system will be located consists of the existing clay base with a percolation time estimated to be greater than 50 minutes/centimetre and imported fill

providing a percolation time of 8 minutes/centimetre. The facility will operate with a Class 4, trench bed sewage system. According to the Applicant, the total daily design flow will be 3, 324 litres.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed self-service gas bar and drive through window kiosk should be considered a "service station" for the purpose of calculation of the total daily design flow under Article 8.2.1.3. and Table 8.2.1.3.B. of the Ontario Building Code.

Article 8.2.1.3. requires that, when calculating the total daily design flow for service stations, 950 litres for each water closet, in addition to the highest of the flow that would be generated from either the fuel outlets (at 560 litres per day each) or the number of vehicles served (at 20 litres per day per vehicle). The Code however, does not provide a definition for either service station or fuel outlet, but does stipulate that undefined terms shall have the meaning which is commonly assigned to them in the context in which they are used.

4. Provisions of the Ontario Building Code

8.2.1.3. Sewage System Design Flows

1. For *residential occupancies*, the total daily design *sanitary sewage* flow shall be at least the value in Column 2 as determined from Table 8.2.1.3.A. (See Appendix A.)
2. For all other *occupancies*, the total daily design *sanitary sewage* flow shall be at least the value in Column 2 as determined from Table 8.2.1.3.B. (See Appendix A.)
3. Where a *building* contains more than one establishment, the total daily design *sanitary sewage* flow shall be the sum of the total daily design *sanitary sewage* flow for each establishment.
4. Where an *occupancy* is not listed in Table 8.2.1.3.B., the highest of metered flow data from at least 3 similar establishments shall be acceptable for determining total daily design *sanitary sewage* flow.

Table 8.2.1.3.B. (Cont'd)

Other *Occupancies*

Forming part of Sentence 8.2.1.3.(2)

Establishments[1]	Volume (litres)
Service Stations (No vehicle	

washing)[4] a. Per water closet, and i. Per fuel outlet, or ii. Per vehicle served)	950 560 20

5. Applicant's Position

The Applicant stated that they are in the process of redeveloping the gas station currently located on site. The proposed self-service gas bar would serve a maximum of eight cars at any one time with an estimated 400 vehicles serviced per day. The Applicant submitted that, while he has agreed to use the Code provision for the food service portion of this development, it is inappropriate to use the calculation for daily design flow generated by the "service station" definition in Table 8.2.1.3.B. He argued that a gas bar is not a service station, since that would imply a more elaborate, full service operation. The flow calculated using the "service station" criteria in the Code far exceeds the expected flow that would be generated from a self-service gas bar use. As a result, the Applicant argued that the highest of the metered flow from three other similar establishments may be used in this instance.

In this regard, the Applicant provided metered readings from two establishments in Milton and one in Burlington that are operating similar gas-bar type uses. This data showed that the other facilities all produced a daily flow well below the level found in the Table. Therefore, the Applicant took the position that, to accurately calculate the flow rate from this proposal, the flow generated from the food service operation should be combined with the flow rate identified by using the data collected from similar area establishments.

6. Respondent's Position

The Respondent submitted that a gas bar, or gas station, is considered a service station and, therefore, Table 8.2.1.3.B. of the Ontario Building Code should be used. While the numbers in the table may appear high, it would be inappropriate to deviate from the approved calculation method which requires that the daily design flow be based on the Table for identified establishments.

7. Commission Ruling

It is the decision of the Building Code Commission that, while this type of facility is considered a service station for the purpose of calculating the total daily design flow under Article 8.2.1.3. and Table 8.2.1.3.B., given the location of the proposed facility and the water meter data provided from similar locations, the total daily design sewage flow may be calculated based on 560 litres per pump stand. Accordingly, the total daily design sewage flow for the gas bar portion of the facility will be 2240 litres per day, plus 950 litres for the washroom. The total daily design sewage flow for the drive through portion of the facility is not in dispute and will be negotiated between the parties based on the contributing area.

8. Reasons

i. The water meter data provided by the Applicant demonstrated that the flows calculated under Table 8.2.1.3.B. for a Service Station at this type of location may be considered excessive if the term fuel outlet refers to the number of cars serviceable at one time. It was demonstrated through this data that the average day water consumption on a monthly basis for three "similar" gas bars was well below the total daily design sewage flow calculated under Table 8.2.1.3.B. using the "fuel outlet" definition.

ii. (ii) The calculated total daily design sewage flow generated by the facility results in a leaching bed requiring in excess of 150 metres of distribution pipe and a pump, syphon or balancing system. This dosing will allow some "balancing" of occasional peak flows generated by short term intense use of the gas bar.

Dated at Toronto this **12th,** day in the month of **April,** in the year **2001** for application number **2001-20.**

RULING

1. The Applicant

Mr. Richard Cerny, V.P. Construction, Matthews Southwest Properties Inc., Mississauga, Ontario, has received a building permit under the Building Code Act, 1992 and is currently constructing an office complex known as the Bell Mobility Centre, 5099 Creekbank Road, Mississauga, Ontario.

2. Description of Construction

The Applicant is constructing a new office complex comprised of three separate oval-shaped towers, two of which will be six stories (the north and east towers) and one is to be four stories (the south tower). The ground floor, which is shared by all three towers, is to contain a call centre. The buildings are also connected at the "lower ground floor" (or concourse level). This space will be allocated for retail uses. Below this will be two levels of parking (referred to as floors P1 and P2) serving the entire complex with enough space for roughly 1,600 cars. A portion of the P1 level is to contain some amenity space that is to include washrooms, a lounge, internet stations and a games/arcade room. (The amenity portion of the P1 floor area was the subject of a different BCC hearing - BCC Ruling No. 01-15-808.)

The overall complex is classified as having a Group D - Business and Personal Services (office) occupancy with an ancillary Group E - Mercantile (retail) occupancy on the lower ground floor level. The building is described as six storeys in building height (not considered a high building under OBC 3.2.6.) and 79,247 m^2 (852,693 ft^2) in building area. It is of noncombustible construction and will be equipped with a full sprinkler system, a fully addressable fire alarm system and a standpipe and hose system complete with 38 and 63.5 mm (1 ½ and 2 ½ in) hose outlets.

The construction in dispute involves two areas; the emergency power supply to the building and the design of the sprinkler system.

Regarding power supply, it is the Applicant's intention *not* to maintain an on-site store of fuel to supply back-up generators nor to install individual battery packs throughout the building to provide emergency power. Instead, as an alternative source of normal and emergency power, he is proposing that the building be supplied by two independent 13.8 kV substations that will be connected to the local hydro utility. In addition, a co-generation plant is to be constructed that will generate power on-site and will be used primarily as a source of energy for the complex during daily peak demand power periods (when the hydro power rates are high). A switchboard system will automatically transfer electrical supply to the building between the two hydro substations and the co-generation plant.

According to the Agent's (for the Applicant) submission, "(t)he co-generation plant will be a separate, fire-rated structure attached to the building." The plant will contain four 1250 kW, 600V, 60 Hz generators "driven by natural gas supplied by the local utility." They will be installed "in accordance with requirements of CAN/CSA-C282-M89, "Emergency Electrical Power Supply for Buildings" with the exception of paragraph 6.4 "Fuel Supply"." As noted, an on-site fuel supply will not be provided as required by CAN/CSA-C282-M89. However, "(t)he residual fuel supply available to the co-generation plant in the event that the main gas valve is closed at the street will allow engines to operate for 30 minutes." To provide the anticipated 400 kW of emergency power required for lighting, building services and fire alarms in the event of a sudden loss of utility power,

"at least one generator will be kept running all the time so that it will be ready to pick up the life safety related loads within fifteen (15) seconds as required."

In essence, the Applicant's proposal is to provide a normal, daily power supply system that receives energy from a variety of sources which, in the Applicant's view, obviates the need for an independent, dedicated emergency back-up system.

The second area of dispute involves the corridor and office configuration and the proposed sprinkler system design. In particular, the Applicant is proposing a unique interior design for the office floors of the north, east and south towers of the complex where the main corridors would rise the full height (3.48 m, 11 ft, 5 in) between the floor slab and the underside of the floor slab above. For the areas where the actual offices and work stations would be located the Applicant is proposing a typical drop ceiling installation fixed at 737 mm (2 ft, 5 in) below the underside of the ceiling slab. The construction in this ceiling cavity contains, in the Agent for the Applicant's words, "virtually no combustible material".

The perimeter walls, where the offices meet the corridors under this proposal, would not be extended to the underside of the floor slab above. Instead, these walls would terminate at the height of the drop ceiling. The Applicant is proposing to provide sprinkler heads in the ceiling of the office area, but not in the concealed space above. In addition, in the corridor near the opening where the upper portion of the corridor walls meet the ceiling cavity, the Applicant is also proposing to hang from the slab above (at the same height as the office ceiling) a 457 mm (18 in) wide noncombustible cable tray for the many communication wires, cables and fibre optics.

The construction in dispute involves the opening where the corridors connect to the ceiling cavity and the lack of sprinklering in the concealed space above the offices. In more typical office interior design the drop ceiling would either cover the entire floor area or be fully enclosed. In other instances the drop ceiling may be omitted completely.

As an alternative to either providing a fully enclosed ceiling space or sprinklering the ceiling cavity, the Applicant is proposing to protect the opening or connection between the corridor and the ceiling cavity by installing closely spaced, quick response sprinklers in the corridors near the underside of the ceiling slab (305 mm, 12 in or less) above the office perimeter walls. The Applicant is also proposing to construct a baffle that is attached to, and projects 584 mm (23 in) down from the ceiling slab so that it terminates within 152 mm (6 in) of the top of the drop ceiling. This baffle is to run the length of the opening and would be set back into the space above the drop ceiling by approximately 305 to 457 mm (12 to18 in), as measured from the outer side of the office perimeter wall and sprinkler head above.

The Applicant is proposing this interior office design and sprinkler system installation because the building's occupant - a telecommunications corporation - will require nearly continuous access to the cable trays and hence the trays are intended to be put in the upper portions of the corridors. Extending the perimeter walls to the underside of the ceiling slab would not be feasible, in the Agent's opinion, due to the number of cables that would run from the cable trays to serve the adjacent office floor areas. In addition, the Agent notes that "(i)nstalling sprinkler heads above the finished ceilings is also not feasible due to the number of obstructions located above the finished ceilings and the logistics of maintaining unobstructed sprinkler coverage." As well, the Agent notes that the full height corridors, with exposed floor slab, sprinkler lines and cable trays is the aesthetic the occupants desire.

3. Dispute

There are two issues at dispute between the Applicant and Respondent. The first dispute is whether the building's proposed power system, that includes two independent supply connections to two separate street substations and one power producing on-site co-generation plant, offered in lieu of a power supply system conforming with Article 3.2.7.5., provides sufficiency of compliance with Sentences 3.2.7.4.(1) and 3.2.7.9.(4) of the Ontario Building Code.

Prior to examining the Code provisions in dispute it should be noted that Article 3.2.7.5. pertains to the requirement for emergency power and how it is to be installed. In contrast, Sentences 3.2.7.4.(1) and 3.2.7.9.(4) discuss the emergency services, lighting and water supply for fire fighting respectively, and the performance thereof that are to be provided by the emergency power required in Article 3.2.7.5. Similarly, Article 3.2.7.8., the provision requiring emergency power for fire alarm systems, is another service to be provided through the emergency power supply.

Article 3.2.7.5. of the OBC determines the installation requirements for an emergency power system. This Article states, with certain exceptions that are not applicable in the present instance, that an emergency electrical power system must be installed in accordance with CAN/CSA-C282-M, "Emergency Electrical Power Supply for Buildings". Section 6.4.1. of this standard requires that "sufficient fuel supply shall be maintained on site at all times... for at least 2 h."

Clause (1)(a) of Article 3.2.7.4. sets out the requirements for an emergency power supply to provide for emergency lighting in the event that regular power supply is interrupted. Clause (1)(b) stipulates the length of time that the required emergency power system must provide emergency lighting. As the subject structure is not a high building nor a Group B occupancy, 30 minutes of emergency power is the required duration for lighting as mandated in Subclause 3.2.7.4.(1)(b)(iii).

Emergency water supply for fire fighting purposes is required by Sentence 3.2.7.9.(4). In particular, this provision stipulates, with an exemption in Sentence (5) which is not applicable here, that for buildings not within the scope of Subsection 3.2.6. (high buildings), an emergency generator capable of operating under a full load for at least 30 minutes must be provided.

As noted above, the Applicant is proposing a power supply system for this complex that differs from the typical power supply hook-up for most buildings. The multiple electrical service connections and sources of power are offered as an alternative to providing two hours of fuel supply on-site. At issue is whether the Applicant's proposed power supply is equivalent, (i.e., provides sufficiency of compliance) or in fact is superior, to more typical power supply arrangements such as a single source hydro connection combined with on-site emergency back-up generators. In other words, are the engineered levels of power supply contingency the Applicant maintains has been designed into this system, adequate to permit the omission of the mandatory emergency power generation system, which is independent of the public utility grid and still meet the intent of OBC requirements?

If the BCC determines that the proposed power system is an acceptable alternative, the associated question then becomes whether, in lieu of a dedicated, independent emergency back-up system, the power supply arrangement is adequate in terms of fulfilling the requirements of emergency power for lighting and water supply for fire fighting purposes.

The second issue in dispute is whether the proposed sprinkler system design offered as an alternative to NFPA 13, "Standard for the Installation of Sprinkler Systems", provides sufficiency of compliance with Sentence 3.2.5.13. (1) of the OBC.

This provision requires, with certain exemptions that are not applicable to the issue at hand, that sprinkler systems be designed, constructed, installed and tested according to NFPA 13, "Standard for the Installation of Sprinkler Systems". As a referenced document in the OBC, in order to comply with Sentence 3.2.5.13.(13), it is necessary to conform with the standards set out in NFPA 13. Again, similar to the above issue regarding the proposed emergency power supply system, the partially enclosed drop ceiling space combined with the sprinkler system configuration is not specifically addressed by the Code nor its referenced document - the NFPA 13 standard.

The general rule of sprinkler protection under NFPA 13 is found in Sentence 4-1.1 of that standard where it states that sprinkler protection is to be provided throughout the entire building unless it is specifically exempt. Section 4-13.1 of NFPA 13 deals with concealed spaces. This Section does permit some exemptions to the requirement for sprinkler protection.

Clause 4-13.1.1. states that "all concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers." This provision is then followed by 10 exceptions that permit sprinklers to be waived in such spaces. This Clause and the exceptions to it, however, all deal with concealed spaces that contain at least some "exposed combustible construction". As the space above the drop ceiling is comprised of non-combustible construction, the relevance of this Clause then is the corollary to it which is that a concealed space of noncombustible construction would not require sprinkler protection. Put another way, waiving sprinklers from a noncombustible concealed space may not be a specific exception under NFPA 13, but doing so is not prohibited according to that standard either.

The Applicant and the Respondent appear to agree on the above reading of NFPA 13[1]. Where the issue arises between them, however, is whether omitting sprinklers is allowed for partially enclosed spaces as is proposed in this instance. On this matter NFPA 13 appears to be silent.

The Applicant is also proposing the closely spaced sprinkler arrangement in conjunction with baffles as a method to protect the openings to the ceiling cavity. This configuration of sprinklers and baffles is permitted within NFPA 13 as a way to protect openings in floor assemblies in interconnected floor spaces. The Applicant, however, is offering this method as an alternative form of protection for an opening in a wall assembly. This method of protecting an opening in a wall assembly is not recognized by NFPA 13.

At issue, therefore, is whether a concealed space constructed entirely of noncombustible construction for which no sprinklers are proposed is permitted to be only partially enclosed. In addition, do closely spaced, quick response sprinklers combined with baffles provide adequate protection for this opening to the concealed space above the drop ceiling?

For the sake of convenience, since both aforementioned issues relate to the same project on the same site which is currently under construction, the Commission offered that the matters could be heard concurrently. The parties consented to a simultaneous hearing. Accordingly, the BCC's intention is to provide a single ruling document for the two items at issue.

---

[1] The Designate submitted two Formal Interpretation documents from NFPA which described scenarios of fully concealed spaces containing near total noncombustible construction. The interpretations from NFPA indicate that no sprinklering is required in these situations.

4. Provisions of the Ontario Building Code

Sentence 3.2.7.4.(1) Emergency Power for Lighting

(1) An emergency power shall be
(a) provided to maintain the emergency lighting required by this Subsection by a power source such as batteries or generators that continue to supply power in the event that the regular power supply to the *building* is interrupted, and
(b) so designed and installed that upon failure of the regular power it will assume the electrical load automatically for a period of
(i) 2 h for a *building* within the scope of Subsection 3.2.6.,
(ii) 1 h for a *building* of Group B *major occupancy* classification that is not within the scope of Subsection 3.2.6., and
(iii) 30 minutes for a *building* of any other *occupancy*.
(See Appendix A)

Article 3.2.7.5. Emergency Power Supply Installation

(1) Except as required by Articles 3.2.7.6. and 3.2.7.7., an emergency electrical power system shall be installed in conformance with CAN/CSA-C282-M, "Emergency Electrical Power Supply for Buildings". (See Sentence 3.2.7.8.(5) for emergency power supply for voice communication systems.)

Sentence 3.2.7.9.(4) Emergency Power for Building Services

(4) Except as provided by Sentence (5), an emergency power supply capable of operating under a full load for not less than 30 minutes shall be provided by (an) emergency generator for water supply for fire fighting in conformance with Article 3.2.5.7., if the supply is dependent on electrical power supplied to the *building*, and the *building* is not within the scope of Subsection 3.2.6.

Sentence 3.2.5.13.(1) Automatic Sprinkler Systems

(1) Except as permitted by Sentence (2), (3) and (4), an automatic sprinkler system shall be designed, constructed, installed and tested in conformance with NFPA 13, "Standard for the Installation of Sprinkler Systems". (See Appendix A.)

5. Applicant's Position

On the issue of the emergency power supply, the Agent for the Applicant submitted that the proposed power arrangement was an alternative to that typically envisaged in the OBC. He stated that the proposal, which emphasizes multiple sources of power, is at minimum equivalent, and quite likely superior, to a conventional power supply for a building and, therefore, an emergency power system as specified under OBC Article 3.2.7.5. is not necessary. And because this alternative power supply proposal provides multiple sources of energy, in essence, it negates the need to provide a separate emergency back-up system dedicated to supplying emergency power needs, including lighting and water supply for fire fighting. As such, the proposal, he asserted, provides sufficiency of compliance with the requirements of Sentences 3.2.7.4.(1) and 3.2.7.9.(4) of the OBC.

The Agent continued that the size and nature of the building lends itself to the proposed alternate

power arrangement. He explained that there are three sources of power, two power plants and a co-generation plant, all of which switch back and forth using sophisticated switching equipment. In his view, this arrangement is completely adequate for the power requirements in both normal and emergency situations. The proposal aims to avoid single dependency situations that cause complete shut-downs as happened during the ice storm. However, in addition to these three sources of power, the Agent noted that they are also proposing to have 30 minutes of available natural gas fuel supply stored at the site.

The Agent argued that standards other than the OBC allow more flexibility in terms of back-up power supply. The Code, he noted, does not provide alternatives. It assumes that there is only one source of power and that is from the street. The Code does not recognize that this building has two lines from the street direct to two substations and that power is actually produced on-site at the co-generation plant. And it is because of this multiple power source arrangement, the Agent reiterated, that a dedicated emergency power system is not necessary.

As support for this position the Agent submitted letters from Mulvey and Banani, his electrical engineers, stating: "With two reliable sources of energy (Hydro and Gas), three different sources of power as mentioned above, including a total of four on-site generators, very sophisticated synchronizing and control switchgear arrangement, we trust the possibility of losing electrical power is essentially eliminated. We even opine that this proposed power supply arrangement will in reality provide a level of security of supply higher than that stipulated in CSA Standard C282, under which only two sources of power are provided and the diesel generator is required to cold start."

The Agent noted that, as this is not a high building regulated under Subsection 3.2.6. of the OBC, the complex is only required under Subclause 3.2.7.4.(1)(b)(iii) to provide 30 minutes of emergency power to supply the light fixtures. He noted that this 30 minute supply could be possible with the installation of "individual battery packs throughout the building." Nevertheless, his position was that the "proposed electrical system for the project would provide normal and emergency power to all lighting fixtures throughout the building including elevators, public address systems, etc., subject to a major failure of both electrical service feeds and fuel supply to the building at the same time."

The Agent further noted that for this project, again since it is not a high building within the scope of Subsection 3.2.6., "where fire pumps are installed, (the Code) would require a minimum 30 minutes emergency power supply, provided by generators, where the fire pump is dependant (sic) on electrical supply to the building." He argued that, as with emergency lighting, the proposed electrical system, with its multiple sources of energy, would provide adequate normal and emergency power supply to satisfy the water supply for fire fighting Code requirement. The Agent also argued that NFPA 20, "Standard for the Installation of Centrifugal Fire Pumps", allows more flexibility in providing emergency power to supply water for fire pumps than the OBC. He indicated that this standard permits, subject to the authority having jurisdiction, electric drive pumps to be fed from a single public or private utility, two independent public or private utilities, emergency generators, or a combination of both.

As a summation of his position regarding emergency power supply, the Agent rebutted the Designate's comment that fire departments routinely cut off power sources to a property as part of their initial fire fighting strategies. He stated that the level of fire fighting pre-planning conducted by many fire departments today means that shut off of power supply is not automatic. He also reiterated that under his proposal the subject complex would receive an uninterrupted 24 hour a day power supply that would be available for emergency uses as well. In contrast, the Code only requires 30 minutes of emergency power for this building and its required emergency services.

On the issue of sprinkler design, the Agent stated that he is proposing an alternative to the Code required NFPA 13 standard for sprinklers. His intention is to use this configuration for nearly all of the principle corridors throughout the office floors of the north, east and south towers. He said they are proposing this sprinkler configuration because they are attempting to design the building specific to its use, in this case, a high tech facility. As such, the building has countless communication wires, cables and fibre optics and in order to update, modernize and repair this equipment, they were looking for a design with maximum flexibility, referred to as a "web cool" approach. Their solution was to hang the cable trays in the upper portions of the corridors where they would be completely accessible with minimal disruption to the offices and the existing construction. The ceiling cavity under his proposal, the Agent noted, will be used as a plenum.

The Agent provided the following rational as to why his sprinkler design proposal is acceptable as a "compliance alternative":

"The majority of the area exposed to the ceiling (cavity) is a corridor with no combustible content.

"There is virtually no combustible materials located above the finished ceiling space.

"This alternative approach mirrors the design approach in NFPA 13 for protection of opening between floors.

"The proposed wall with closely spaced 'quick response' sprinklers would prevent heat from migrating through to above the finished ceiling."

The Agent noted that the baffles would be constructed throughout most of the corridors where the openings above the drop ceiling are present and in some parts of the ceiling cavity they would also provide sprinkler protection. He concluded by stating that, in his view, the proposal still meets the intent of NFPA 13 while also offering the flexibility of design and use his clients require in their building.

6. <u>Respondent's Position</u>

Regarding the issue of emergency electrical power supply, the Designate for the Respondent submitted that the Applicant's proposal, in their view, does not comply with the OBC, nor other standards or authorizations. As they stated in their submission:

"Article 3.2.7.5. of the OBC requires emergency electrical power to be installed in conformance with CAN/CSA-C282-M, Emergency Electrical Power Supply for Buildings.

"Emergency electrical power is required for this complex in the event of an interruption of the normal supply to the building. Neither the OBC nor the C282 standard appear to consider multiple electrical service connections to a building as an acceptable alternative to providing an emergency power generation system independent of the public utility grid.

"Under 6.4 of CAN/CSA-C282, a sufficient supply of fuel for the in-house generation of electrical energy shall be maintained on site, at all times, to operate the engine under full load for not less that (sic) two hours.

"BMEC authorization 96-05-204 describes the specific terms and conditions for the use of a Natural Gas Emergency Standby Power system and the requirements for on site fuel storage.

"The data currently submitted to this Corporation does not indicate that on site storage of fuel is included in the current design nor does it confirm that the emergency generator meets the requirements of CAN/CSA-C282-M or that it is a BMEC authorized system.

"Consequently, we do not believe that it meets the minimum requirements of 3.2.7.5. of the OBC."

The Designate also added that NFPA 20 only applies to emergency power supply for fire pumps. Therefore, the flexibility the Agent claims that it provides in terms of back-up power supply is not particularly germane to the complete water supply requirements found in Sentence 3.2.7.9.(4).

To conclude this portion of their argument, the Designate stated that the Building Code requires two hours of fuel to be stored on-site. This is consistent with the Ontario Fire Code (which deals with the operation of buildings), specifically Part 6, which also requires two hours of emergency stored fuel. On-site storage of fuel, he argued, was necessary because fire fighters typically cut power to a property in order to reduce the risk when fighting a fire. He stated that it would be onerous on the fire department to create individual information about how each property is supplied with power. He asked that if this proposal is approved, a maintenance document for the property should be attached to the BCC decision. Lastly, the Designate commented that since this is new construction, he did not understand why the Applicant cannot meet Code.

With respect to the issue of sprinkler design, the Designate submitted the following statement:

"Article 3.2.5.13. of the OBC requires that the entire building be sprinkler protected in conformance with NFPA 13.

"NFPA 13 requires that the entire structure be protected with automatic sprinkler(s) unless specifically exempted. One case where protection would be exempt is within totally enclosed, non-combustible concealed spaces. To provide further clarification on the issue of spaces above suspended ceilings, we reference 1999 edition of NFPA 13, 5-13.23 which indicates that protection is required unless the ceiling cavity is totally enclosed[2].

"The use of closely spaced quick response sprinklers to protect the opening into the ceiling space is not recognized by either the OBC nor NFPA 13. This type of design is typically used to augment the protection of openings through floor assemblies, such as inter-connected floor spaces, in which sprinkler protection is provided throughout both compartments, both above and below, and just at the interface.

"No documentation has been submitted such as an opinion or formal interpretation from NFPA to support this proposal and therefore, we are not satisfied that it provides the level of protection required by the OBC and its referenced standard."

The Designate added that their opinion is based on the belief that a concealed space, in order to be a concealed space, must be totally enclosed, otherwise "it cannot be defined as a concealed space." Consequently, if an area is required to be a concealed space in order to eliminate sprinklers under NFPA 13, then it should be completely enclosed. As a result, the corridor wall should be extended to the underside of the ceiling. He continued that he was concerned that the Technical Background Information memo produced by the Ministry's Housing Development and Building Branch for this particular hearing erred in concluding that a concealed space need not be totally enclosed. Because

[2] The current version of the OBC (1997) references the 1996 edition of NFPA.

of this, the Designate argued that the Ministry reached the wrong conclusion regarding the need for sprinkler protection in the ceiling cavity. He suggested that the Ministry "obtain an interpretation directly from NFPA on the definition of a concealed space and the acceptability of the alternative approach."

The Designate concluded by stating that the use of closely spaced, quick response sprinklers in conjunction with baffles is not described in any edition of NFPA 13 and therefore their position was that it is not an acceptable method of omitting the required sprinkler protection in the ceiling cavity.

7. Commission Ruling

It is the decision of the Building Code Commission that the building's proposed power system, that includes two independent supply connections to two separate street substations and one on-site natural gas co-generation plant, does not provide sufficiency of compliance with Sentence 3.2.7.5.(1) of the Ontario Building Code (OBC).

It is also the decision of the Building Code Commission that the proposed sprinkler system design, which includes baffles and close-space sprinkler coverage employed to provide protection with respect to a partially enclosed concealed ceiling space, provides sufficiency of compliance with Sentence 3.2.5.13.(1) of the OBC.

8. Reasons

Re: Proposed Power Supply System

i) Sentence 3.2.7.5.(1) of the OBC, which references Article 6.4.1. of CAN/CSA-C282-M89, requires that two hours worth of fuel be provided on-site for the purposes of operating an in-house generator. The proposed power system for the subject building provides, according to the Applicant, only 30 minutes of stored fuel supply.

ii) The necessary two hour fuel supply is a separate requirement articulated in the OBC than that required for the duration of emergency power for lighting, fire alarm systems and building services. The OBC 3.2.7.5.(1) fuel storage requirement is irrespective of the length of time emergency power is required for services under Articles 3.2.7.4., 3.2.7.8. and 3.2.7.9. Indeed, the only exceptions to Sentence 3.2.7.5.(1) and its referenced standard are the emergency power for hospitals and, under certain circumstances, the installation of fuel supply shut-off valves and exhaust pipes.

iii) Fire fighters routinely cut off natural gas supply to a site when approaching for fire fighting purposes. This practice would leave the proposed co-generation plant, and thereby the subject building, with far less than the required two hour fuel supply. Moreover, the lack of back-up fuel would also become an issue during calamitous weather conditions that may debilitate both near-by substations.

Re: Proposed Sprinkler System

i) OBC 3.2.5.13.(1) references NFPA 13, "Standard for the Installation of Sprinkler Systems". Subsection 4-13.1 of NFPA 13 permits that the concealed space need not be fully enclosed.

ii) The construction located in the ceiling space is noncombustible.

iii) A baffle and close-spaced sprinklers (located on the corridor side of the baffle) will be provided.

iv) The location of the close-spaced sprinkler heads will augment the protection provided by the baffle and will also protect the corridor.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Articles 9.26.5.1. and 9.26.5.2. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Gary Treusch, Freure Riverwalk Ltd., Kitchener, Ontario, for the resolution of a dispute with Mr. Larry Simonato, Chief Building Official, City of Cambridge, Ontario, to determine whether the as-built roofs with a slope of 7 ½/12 that was not constructed with eave protection, except one layer of 15 lb building paper, provides sufficiency of compliance with Article 9.26.5.2. of the Ontario Building Code at the Riverwalk Condominiums, 333-385 George Street North, Cambridge, Ontario.

APPLICANT	Mr. Gary Treusch, Freure Riverwalk Ltd. Kitchener, Ontario
RESPONDENT	Mr. Larry Simonato Chief Building Official City of Cambridge
PANEL	Dr. Kenneth Peaker, Chair Mr. Fred Barkhouse Mr. John Guthrie
PLACE	Toronto, Ontario
DATE OF HEARING	April 26th, 2001
DATE OF RULING	April 26th, 2001
APPEARANCES	Mr. Gary Treusch Freure Riverwalk Ltd. Kitchener, Ontario **The Applicant**

RULING

1. The Applicant

Mr. Gary Treusch, Freure Riverwalk Ltd., Kitchener, Ontario, has received an order to comply under the Building Code Act, 1992 to remedy an alleged deficiency in the eave protection for the Riverwalk Condominiums at 333-385 George Street North, Cambridge, Ontario.

2. Description of Construction

The Applicant has constructed a multi-unit residential development for condominium ownership, having a Group C major occupancy. The development was constructed in several phases over the past five years, with the most recent phase being completed in 2000. The buildings are single storey in building height, designed in a row house or quatroplex format. There are 15 buildings with four dwelling units per block, for a total of 60 units within the development.

The construction in dispute involves the eave protection for these buildings. The roof pitch is 7½ to 12 and the eaves have been protected with one ply of 15 lb asphalt-saturated felt. The roofs have also been shingled with 230 lb shingles having a 20 year product warranty. At each phase of development the condominium buildings passed inspection with the municipality and occupancy permits have been issued for all of the built units. Through a private audit on select units, however, it was discovered that the level of eave protection installed by the roofing contractor was not according to plans and was inadequate to comply with the requirements of the Ontario Building Code.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the one ply of 15 lb asphalt-saturated felt, installed on the building roofs having a slope of 7 ½ in 12 provides sufficiency of compliance with Article 9.26.5.2. of the Ontario Building Code.

Subsection 9.26.5. outlines the OBC requirements for "Eave Protection for Shingles and Shakes". In particular, Article 9.26.5.1. requires eave protection on all shingle roofs, with the exceptions to this requirement listed in Sentence 9.26.5.1.(2). Clause 9.26.5.1.(2)(d) specifically, is applicable in this instance. It exempts roofs from eave protection where the roof has a slope of 1 in 1.5 or greater. A roof with a pitch of 8/12 would provide this slope, however, with a slope of 7½ to 12 as is the case in the subject development, the benchmark for the exemption from eave protection is not met.

Article 9.26.5.2 outlines the materials required for eave protection. In this case, with a roof pitch of 7½/12, either one layer of 50 lb asphalt felt or two layers of 15 lb asphalt felt, cemented together with lap cement would be required. As noted, the Applicant has installed only one layer of 15 lb asphalt-saturated felt on these roofs.

4. Provisions of the Ontario Building Code

9.26.5.1 Required Eave Protection for Shingles and Shakes

(1) Except as provided in Sentence (2), eave protection shall be provided on shingle, shake

the roof slope to a line not less than 300 mm (11 ¾ in) inside the inner face of the exterior wall.

(2) Eave protection is not required
(a) over unheated garages, carports and porches,
(b) where the roof overhang exceeds 900 mm (2 ft 11 in) measured along the roof slope from the edge of the roof to the inner face of the exterior wall,
(c) on roofs of asphalt shingles installed in accordance with Subsection 9.26.8.,
(d) on roofs with slopes of 1 in 1.5 or greater, or
(e) in regions with 3 500 or fewer degree-days.

9.26.5.2. Materials

(1) Eave protection shall be laid beneath the starter strip and shall consist of
(a) No. 15 asphalt-saturated felt laid in two plies lapped 480 mm (18 7/8 in) and cemented together with lap cement,
(b) Type M or S roll roofing laid with not less than 100 mm (4 in) head and end laps cemented together with lap cement,
(c) glass fibre or polyester fibre coated base sheets, or
(d) self-sealing composite membranes consisting of modified bituminous coated material.

5. Applicant's Position

The Applicant submitted that an independent technical audit commissioned by the owners uncovered that, despite the pitch of the roof being 7 ½ /12, there was only one ply of 15 lb felt applied at the eaves. The building plan originally called for two plies, however, the installer inadvertently provided only one. He recognized the deficiency in the eave protection relative to the Code requirement, however, as the roof pitch is only slightly less than the 8/12 slope which would provide exemption from any type of eave protection, he believed that the effect would be negligible.

The Applicant stated that his company has been in business for 47 years with an estimated 8,000 homes built during that time. In his experience it has been found that ice damming occurs only on lower sloped roofs (i.e., less than 6/12 pitch). In addition, he advised that the buildings are provided with 230 lb shingles, exceeding Code requirements. Most buildings, he noted, have only 210 lb shingles. (The installed shingles also carry a 20 year guarantee which also surpasses the usual 15 year guarantee that most house shingles possess.) As a result, the Applicant argued that adequate protection from ice damming will be provided by the one layer of felt and the higher grade shingles.

The Applicant also submitted that some of the roofs in question had been in existence for 5 years with no leaks reported. The Applicant stated that it may be more detrimental to the integrity of the roofs if repairs were to be undertaken at this point. All roofs have been installed and have had an opportunity to seal. If repairs were to be conducted, which would include the removal of 900 mm of shingles to apply the additional layer of felt, the "monolithic" layer of shingles would be damaged. In his opinion, this would provide a seal that " would be inferior to what is there now."

6. Respondent's Position

The Respondent did not attend the hearing. The Commission therefore relied only on his written submission which concluded:

"The Builder, Freure Homes, was issued a Building Permit based upon the plans showing eaves protection of 50 lb Felt for the roofs. We have been advised by Freure Homes, the builder, that the roofer applied 1 layer of 15 lb felt paper only. Although this can be used to suggest that the builder attempted to meet the 'intent' of the code, the 1 ply does not meet the code either.

"We have also been advised by the builder that the roof slope is actually 7 ½ to 12. This is short of the actual code requirement by ½ inch, the code being 8 to 12 before eaves protection may be eliminated. A review of the plans also showed the slope of the roofs to be 7.5 to 12."

The Respondent concluded by indicating that they will rely on the ruling of the Commission with respect to whether sufficiency of compliance for the eave protection has been provided in this development.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-built roof with slope 7 ½ to 12 that was not constructed with eave protection, except one layer of 15 lb building paper provides sufficiency of compliance with Article 9.26.5.2. of the Ontario Building Code at the Riverwalk Condominium, 333-385 George Street North, Cambridge, Ontario on condition that:

a) The builder will provide a 10 year warrantee on installation and workmanship for the roofs.

8. Reasons

i) The slope is very close (at 94%) to the pitch required for exemption from the eave protection requirement in the Ontario Building Code.
ii) One layer of 15 lb building paper has been provided.
iii) Most roofs are provided with 210 lb shingles. These roofs have 230 lb shingles with a 20 year warrantee.
iv) The manufacture's warrantee remains in effect.
v) Some roofs have been in place for 5 years without a problem.

Ruling No. 01-11-804
Application # 2001-12

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Sentences 3.7.2.1.(1) and 9.7.1.2.(1) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Liz Root, Employee, Context Ideal Inc., for the resolution of a dispute with Yaman Uzumeri, Chief Building Official, City of Toronto, to determine whether the proposed design of the original Verona Suite plan, that includes a windowless, enclosed "study" room, complies with Sentences 3.7.2.1.(1) and 9.7.1.2.(1) of the Ontario Building Code at the Ideal Condominium building, 301 Markham Street, Toronto, Ontario.

APPLICANT	Liz Root, Employee Context Ideal Inc. Toronto, Ontario
RESPONDENT	Yaman Uzumeri Chief Building Official City of Toronto
PANEL	Len King, Vice-Chair Fred Barkhouse Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	March 15th, 2001
DATE OF RULING	March 15th, 2001
APPEARANCES	Allan Larden Larden Muniak Consulting Inc. Toronto, Ontario **Agent for the Applicant** Ashraf Hakimjee Building Engineer Toronto, Ontario **Designate for the Respondent**

RULING

1. The Applicant

Liz Root, Employee, Context Ideal Inc., Toronto, Ontario, has received a building permit under the Building Code Act, 1992 and is presently constructing a residential high rise structure known as the Ideal Condominium building, at 301 Markham Street, Toronto, Ontario.

2. Description of Construction

The Applicant is erecting a Group C - residential condominium tower, nine storeys in building height and 1,100 m^2 in building area. Like most condominium towers, the Ideal project contains various suite options with differing design configurations. Among the options is a unit known as the Verona which is rectangular in shape and measures approximately 6 m by 10 m (not including terrace) with the narrow dimension facing the exterior.

The Verona is described as a one bedroom suite approximately 600 m^2 in area that includes an entrance hallway, an open kitchen, a three piece bathroom, a living/dining/bedroom area and a study. The rooms are configured with the entrance hallway and adjacent study located in the interior, or corridor, end of the suite. The mid portion of the unit is occupied by the bathroom which is divided from the open kitchen. The exterior end of the suite in the revised plan contains the main room of the unit; the combined living/dining/bedroom area. This space faces out towards a full width terrace.

As shown on the original plans, the study was a four wall enclosure with a closet, no window and direct access to the bathroom. At the other end of the suite, the bedroom on these plans was to be an enclosed room with two small bedside closets, direct bathroom access and a glazed sliding door providing walkout access to the balcony. A non-structural wall with paired sliding doors was proposed to separate the bedroom from the living/dining area.

After discussions with the City, the plans were revised to remove the door and a connected portion of wall from the study. The intent of this was to partially open up the study to the cooking area in order to introduce “borrowed light” from the exterior of the suite. All other aspects of the study, however, remain as before. The living/dining and bedroom areas were also modified in the revised plan. The bedside closets were removed and the partition wall between the living/dining space and the bedroom was made optional and could be included at the request of the purchaser. The result of this change created a combined living/dining/bedroom space that has no closets and is integrally connected to the open kitchen.

The construction in dispute involves the provision of windows when considering the proposed layout of the original Verona suite, specifically the designated versus intended function of the study and the bedroom areas.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed design of the original Verona Suite plan, that includes a windowless, enclosed “study” room, complies with Sentences 3.7.2.1.(1) and 9.7.1.2.(1) of the Ontario Building Code at the Ideal Condominium

building.

The first provision, Sentence 3.7.2.1.(1), requires (with certain exceptions not applicable here) that every room in a Part 3 building such as the Ideal Condominium used for sleeping and every principal room be provided with windows sized according to the standards prescribed in Part 9 of the OBC. Principal rooms are not a defined term in the OBC, they are simply referred to as rooms "such as a living room, dining room or combination thereof". OBC 3.7.2.1.(1) offers no indication as to whether a study is to be considered as a principal room.

The reference in Sentence 3.7.2.1.(1) to Part 9, it should be noted, is for window sizing only. OBC 3.7.2.1.(1) also makes clear that the requirements of Article 9.7.1.3. (which deals with requirements for using a bedroom window as a means of escape) do not apply.

Sentence 9.7.1.2.(1), then is where the OBC sets out its requirements for window sizes for both Part 3 (as referred in Sentence 3.7.2.1.(1)) and Part 9 residential occupancies. Table 9.7.1.2. is included as part of this Sentence. As study rooms are not specifically cited on this table nor are "principal rooms", the category found on the lowest row, "Bedrooms and other finished rooms not mentioned above", becomes applicable. For rooms in this catch-all category five per cent unobstructed glass area is mandated.

Thus, it seems apparent that if the study room in question can be considered either as a bedroom or a principal room then, by reference to Part 9, specifically Table 9.7.1.2., at least some window area is required. However, if the room is deemed not to be either a bedroom or principal room as described in Sentence 3.7.2.1.(1) no reference to the table occurs, in which case no window area would be required.

Based on the revised plans the Applicant obtained a building permit, but is now requesting that the original design be reinstated. This proposed reversion back to the first design created the subject dispute with the municipality. The essence of this dispute then is whether the rear room as originally designed within the proposed Verona suite is required to be provided with direct access to natural light by means of windows or other such wall openings to the exterior.

4. Provisions of the Ontario Building Code

Sentence 3.7.2.1.(1) Window Areas

(1) Except as provided in Sentences (2) and (3) or otherwise permitted, every room used for sleeping in any *building*, and every principal room such as a living room, dining room or combination thereof in *dwelling units* shall be provided with windows having areas conforming to Part 9, except that Article 9.7.1.3. does not apply. (See Appendix A.)

Sentence 9.7.1.2.(1) Minimum Window Areas

(1) Except as required in Article 9.7.1.3. and Sentence (3), the minimum window glass area for rooms in *buildings* of *residential occupancy* or which are used for sleeping shall conform to Table 9.7.1.2.

5. Applicant's Position

The Agent for the Applicant submitted that the study is not a principal room and therefore no window is required. Indeed, without status as a "principal room" Sentence 3.7.2.1.(1) cannot be used as the basis for referral to Table 9.7.1.2. The municipal officials, he argued, seem to have ignored the "principal room" test and are simply applying the "finished room" criteria found in Table 9.7.1.2. The Agent noted that, when determining the requirements of a Part 3 building, proper application of the OBC requires that the room be evaluated to determine whether it is considered as a principal room. If so, only then are the Table 9.7.1.2. requirements applicable.

The Agent then offered some history of how the dispute arose. He acknowledged that they wanted the rear, interior room with no window to be considered as a bedroom. The City, however, refused. Consequently, the Applicant revised the plans to make this room into a study. Along with this change were several design modifications that were intended to let borrowed, or second hand, light into the study from the perimeter of the suite.

Regarding the issue as to the ultimate use of the study space, the Agent argued that the Code cannot "constrain the ultimate manner in which a dwelling unit occupant uses his or her space". It is impossible to control whether someone will sleep in the study. To attempt to do so would be fruitless micro-managing by the state in terms of how people use their space. As a result, it makes no sense to focus the hearing on the likely use of the disputed room. Instead, he reiterated that the subject dispute should be centred on whether or not the study should be viewed as a principal room. A determination on this matter will provide OBC direction regarding window requirements.

The Agent explained that the study, as a separated space, was an important concept in the marketing of the units. As the role of computers have grown in importance, so has the space dedicated for them within newly designed and built living space. Moreover, the original proposed suite represents a growing trend in residential condominium design where space must be innovative and flexible to use. He noted that the Verona unit without the study still meets the OBC's minimum size requirements for all the basic rooms. In other words, he argued, the study can be viewed as "add-on" area, not principal space.

The Agent continued by discussing previous correspondence from 1998 he had with the Ministry of Municipal Affairs and Housing's Building and Development Branch which indicated that dens, libraries and media rooms in Part 3 residential buildings need not be provided with windows. He argued that a "study" can be reasonably be regarded as a synonym for den. The Agent then pointed to the Technical Background Information memo produced by the Branch for this hearing. This memo confirmed the Branch's earlier position, and in so doing, supports his view that a window is not required in the den/study, he argued. He quoted the following section from the Branch memo:

"Any room which is acknowledged not to be a principal room is therefore not required to be provided with a window.

"A den in a residential apartment in a building governed by OBC Part 3 is not considered to be a principal room and is therefore not required to be provided with a window. A "Study" is synonymous with "den".

"Once a dwelling unit design provides sleeping accommodation which satisfies the minimum provisions of the Code for such functions, there is no basis in the Code for requiring additional rooms or spaces designed as study rooms or dens to be considered to be bedrooms which are required to be provided with windows."

The Agent further argued that"(t)here are many recent examples of residential apartment design

where a study or den not located adjacent to an exterior wall has been incorporated in apartment plans and where such study or den has little, if any, line-of-sight exposure of openings in its perimeter walls to windows in the wall of an adjacent room or space.

"Many, if not most, of these examples have other rooms which are clearly designated bedrooms. However, the spaces designated as dens or studies are certainly big enough to sleep in and have not suffered the interpretation that they must be considered to be bedrooms."

The Agent questioned whether municipal inspectors should have the authority to assume that if a room has a closet it must be considered as a bedroom. He noted that "(t)here are many examples of closets or cupboards being built into or openable from rooms and spaces which are not designed as sleeping areas in dwelling units."

In response to comments made by the Designate during the hearing the Agent made the following three statements: First, principal rooms in the Code are not based on size. Principal room status is conferred because of necessity and function that contribute to making a unit a residential space. Second, the difference between a Part 3 and Part 9 building relates mostly to size. A smaller building has more wall space relative to the number of rooms unlike in a large building which has the potential for a greater number of deeper interior rooms. Third, municipal by-laws are superceded by the Ontario Building Code and as a result the City's property standards by-law regulating windows has no applicability.

Finally, the Agent concluded by stating that, "(t)he original design of the Verona suite at 301 Markham Street provided for sleeping accommodation in a combined living, dining and sleeping area. This satisfied OBC provisions for a dwelling unit. The provision of a designated Study room in a portion of the dwelling unit not next to an exterior wall where such room had no openings facing windows did not represent a violation of the OBC."

6. Respondent's Position

The Designate for the Respondent submitted that the study is a finished room which should comply with Article 9.7.1.2. As a reasonably small unit with few rooms, the study as a space assumes relative importance within the suite. On this basis, he indicated that the City considered the study to be a principal room. The Designate noted that if the building was governed by Part 9 of the OBC, the requirements would be more onerous and a window would be necessary in this room even if it were considered a non-principal room.

In addition, with the optional nature of the partition wall between the front bedroom and the living area, functionally this renders the study as a natural bedroom, the Designate argued. Besides, the study is large enough under the OBC to be a bedroom and it contains a full closet. In fact, it is even larger than the area described as bedroom in the original plan. Based on these reasons, the City viewed this space within the Verona suite as being both a principal room and a sleeping room.

The Designate then indicated that the City had approved the second, or revised, option in which a portion of the wall, including the door, of the study was cut away to allow the transmittal of borrowed light, even though this is a concept not recognized by the OBC. He noted that the City also has a property standards by-law mandating natural light. While the by-law is based on the requirements found in the Table in Part 9, it is applied by the City to Part 3 buildings as well. The property standards by-law, however, offers certain flexibility since it incorporates the concept of borrowed light.

On the issue of borrowed light, the Designate questioned why the present structure, comprised of new construction and not a conversion project of an existing building, should enjoy such leniency in terms of its provision of natural light. He indicated he would have more sympathy for the Agent's arguments and comments if the building was facing the design constraints and limitations often encountered by conversion projects.

In summation, the Designate stating that windows are not trivial, they serve an important function in a building. They are needed for natural light, ventilation and preventing cabin fever. And whereas he has heard about potential changes to the National Building Code to relax window standards for such buildings, the current version of the OBC remains in effect. As a result, in his view, a window is required. The Designate concluded by stating that the ruling on this issue is significant and will likely have wider implications.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed design of the original Verona Suite plan, that includes a windowless, enclosed "study" room, does not comply with Sentences 3.7.2.1.(1) and 9.7.1.2.(1) of the Ontario Building Code at the Ideal Condominium building, 301 Markham Street, Toronto, Ontario.

8. Reasons

i) Based on reasons a) and b) below it is the assessment of the BCC that the study is a principal room and may possibly function as a bedroom as well. Consequently, the requirements of Table 9.7.1.2. apply.

   a) The Verona unit does not comply with Sentence 3.7.2.1.(1) of the Ontario Building Code regarding windows in that the area indicated as "bedroom" at the outer perimeter of the building is divided from the living/dining area by an optional wall. When the optional wall is removed this area does not constitute a sleeping room consistent with a suite marketed and sold as a one bedroom unit.

   b) Likewise, the area designated as a "study" is provided with direct access to the bathroom and a permanent closet which will invite the use of this room as a bedroom in contravention of Sentence 3.7.2.1.(1) of the Code.

ii) The revised design, which employs the concept of "borrowed light", is an innovative solution to the problem of providing natural light to the area designated as a study.

Ruling No. 01-10-803
Application # 2001-10

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Clause 3.4.2.5.(1)(d) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Pan Giammarco, Project Engineer, Norampac Incorporated Leaside Division, for the resolution of a dispute with Mr. Mani Navabi, Chief Building Official, City of Vaughan, to determine whether the proposed access to exit corridor, designed using a combination of the parameters outlined in Clause 3.4.2.5.(1)(d) and Sentence 3.4.2.5.(2) of the Ontario Building Code, provides sufficiency of compliance within a Group F, Division 2 occupancy at the Creditstone Industrial Building, Blocks 16, 17 and 18 on Plan 65M - 2696, Vaughan, Ontario.

APPLICANT	Mr. Pan Giammarco, Project Engineer Norampac Incorporated Leaside Division Toronto, Ontario
RESPONDENT	Mr. Mani Navabi Chief Building Official City of Vaughan
PANEL	Mr. Len King, Vice-Chair Mr. Michael Steele Mr. Fred Barkhouse
PLACE	Toronto, Ontario
DATE OF HEARING	March 15th, 2001
DATE OF RULING	March 15th, 2001
APPEARANCES	Mr. Leszek Muniak Larden Muniak Consulting Inc. Toronto, Ontario **Agent for the Applicant** Mr. Mani Navabi, Chief Building Official City of Vaughan Toronto, Ontario **The Respondent**

RULING

1. The Applicant

Mr. Pan Giammarco, Project Engineer, Norampac Incorporated Leaside Division, Toronto, Ontario, has received a building permit under the Building Code Act, 1992 and has recently constructed a new industrial building known as the Creditstone Industrial Building, at Blocks 16, 17 and 18 on Plan 65M - 2696, Vaughan, Ontario.

2. Description of Construction

The Applicant is nearing completion on the construction of a new one storey industrial building having a Group F, Division 2 major occupancy. The structure is comprised of noncombustible construction and has a building area of 35, 435 m^2. It will be equipped with a sprinkler system, a standpipe and hose system and a fire alarm system.

The proposed building has an irregular perimeter framing a floor area generally measuring 200 m by 221 m. The facility is essentially divided into two areas. A warehouse area is located on the eastern side of the building and a manufacturing plant is located on the west. These areas will be separated by a north-south partition that spans almost the entire width of the building. In addition, immediately east of the warehouse area and adjacent to the eastern exterior wall is a depressed rail siding that will run through the building, extending from the north exterior wall to the south exterior wall. A 9 m wide corridor is proposed to run between the rail siding and the warehouse portion of the building with an egress doorway located at either end. The corridor will exceed 10 m in height and it is also proposed that a air handling system will be installed in the vicinity of this corridor to facilitate hourly air exchange.

The construction in dispute involves the access to exit design within the subject building. The layout is designed so that corridors throughout the building lead to exits spaced at 60 m around its perimeter which measures approximately 844 linear m. However, when the rail siding is in use, three of these required exit doors will be blocked. To compensate for this period of inaccessibility, the Applicant has proposed that the 9 m wide corridor will serve to comply with the requirements of Clause 3.4.2.5.(1)(d) of the Code which permits a travel distance of 105 m in a sprinklered floor area. This combination of design parameters (location of exits 60 m around the perimeter and 105 m travel distance through a public corridor) incorporates two access to exit provisions outlined in the Code.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed access to exit corridor design that incorporates the provisions of Sentence 3.4.2.5.(2) in combination with Clause 3.4.2.5.(1)(d) of the Ontario Building Code (OBC), provides sufficiency of compliance within a Group F, Division 2 occupancy.

Sentence 3.4.2.5.(2) is an exception to Sentence 3.4.2.5.(1) of the OBC. With the exception of high hazard industrial occupancies, Sentence (2) permits the travel distance stipulated in Sentence (1) to be waived provided that exit doors are situated at a spacing of not more than 60 m around the perimeter of the building and that each main aisle in the floor area leads directly to an exit.

With respect to Clause 3.4.2.5.(1)(d) the Building Code states that, where more than one exit from a floor area is required, the travel distance to at least one exit shall not exceed 105 m in any floor area served by a public corridor in which rooms and suites are not separated from the remainder of the area by a fire separation. The Code stipulates that the public corridor be a minimum of 9 m wide and 4 m high. In addition the building must be sprinklered and not more than one half of the required egress doorways from a room or suite are to open into the public corridor. When reviewing this provision one should note that the term "public corridor" has been italicized and is therefore a defined term within the Building Code. The OBC defines a public corridor as "a corridor that provides access to exit from more than 1 suite."

The subject building has been designed with access to egress by way of aisles that lead to exits located every 60 m around the perimeter of the building. Where this access is compromised by use of the internal spur rail line, the Applicant has proposed a 9 m wide corridor to ensure that a travel distance of 105 m is not exceeded. This, together with other compensating measures, is intended to provide sufficiency of compliance with the requirements of the OBC. The building is sprinklered and the proposed corridor will meet the corridor dimensions outlined. In addition, less than one quarter of the required egress routes will be served by this corridor.

To address the question of sufficiency of compliance regarding this proposal the following issues need exploration. The first is whether it is appropriate to apply the requirements of Sentence 3.4.2.5.(2) in combination with Clause 3.4.2.5.(1)(d). As noted above, Sentence 3.4.2.5.(2) is an exception to Sentence 2.4.2.5.(1) where, because of the size of a building, the minimum travel distance requirements cannot be achieved. The second issue is whether Clause 3.4.2.5.(1)(d) applies to this single F2 occupancy building. It is argued by the Respondent that, in light of the reference in this provision to providing access to exit from more than 1 suite, it cannot be considered an acceptable standard for single occupancy buildings.

4. Provisions of the Ontario Building Code

3.4.2.5. Location of Exits

(1) Except as permitted by Sentences (2), (3) and 3.3.2.4.(6), if more than one *exit* is required from a *floor area*, the *exits* shall be located so that the travel distance to at least one *exit* shall be not more than

(d) 105 m (344 ft 6 in) in any *floor area*, served by a *public corridor*, in which rooms and *suites* are not separated from the remainder of the *floor area* by a fire separation, provided

(i) the *public corridor* is not less than 9 m (29 ft 6 in) wide,

(ii) the ceiling height in the *public corridor* is not less than 4 m (13 ft 1 in) above all floor surfaces,

(iii) the *building* is *sprinklered*, and

(iv) not more than one half of the required egress doorways from a room or *suite* open into the *public corridor* if the room or *suite* is required to have more than one egress doorway,

(2) Except for a *high hazard industrial occupancy*, Sentence (1) need not apply if *exits* are placed along the perimeter of the *floor area* and are not more than 60 m (196 ft 10 in) apart, measured along the perimeter, provided each main aisle in the *floor area* leads directly to an *exit*.

5. Applicant's Position

The Agent for the Applicant advised that the subject company manufactures paper products. The building has an occupant load of approximately 138 to 140 people, with 64 in the office area, 70 in the manufacturing plant and approximately 4 to 6 in the warehouse adjacent to the spur rail line. To allow the manufactured products to be loaded directly onto train cars, a depressed rail siding runs into the structure through the warehouse area.

The Agent advised that in designing the facility many options were explored. They had reviewed proposals to incorporate stair towers over top of the train and also investigated the possibility of uncoupling the cars to allow building personnel access to the doors on the eastern wall. It was concluded, however, that the access to exit requirements could be addressed with alternative corridor configurations. In addition to meeting the exit requirements set out in the Code, the Agent submitted that air handling equipment over the corridor will be provided to facilitate air changes every hour. The building will also be equipped with a fire alarm system, although one is not required by the Code in light of the low occupant load. These compensating measures, he argued, would provided sufficiency of the compliance with the Building Code.

The Agent emphasized that the layout of the warehouse area is such that the perimeter doors on three of the buildings's exterior faces may be readily accessed. The fourth side is periodically blocked by rail cars inside the building. He argued that the 9 m wide aisle running the full length of the building in front of this rail line could be considered as an open corridor. The aisle is not separated from the remainder of the floor area and a doorway is located at either end. He stated that this aisle will be kept clear of obstruction at all times. He suggested that any fire will not easily spread and, in any event, the sprinkler system will automatically be activated, thereby further limiting the spread of smoke and fire.

In support of the proposed design, the Agent submitted that " the travel distance to an egress door along the main aisles in the centre of the manufacturing facility is the same as the distance to an egress door along the public corridor serving as egress on the fourth side of the building. OBC sentence 3.4.2.5. does not differentiate exit requirements by occupancy type. Furthermore, sentence 3.4.2.5.(1)(d) permits a public corridor to exist without a fire separation to the floor area served." He advised that less than one quarter of the required egress routes are served by this corridor.

In summation, the Agent advised that, although the final design is not yet complete, all main aisles will lead directly to exits. He emphasized that "(t)he utilization of two types of egress routes out of a floor area is common in many building types." In addition, he argued that the Code does not state that 105 m can only be applied to mall occupancies.

6. Respondent's Position

The Respondent submitted that in an F2 occupancy where sprinklering is provided, the Code permits a travel distance of 45 m in Clause 3.4.2.5.(1)(c). If this distance cannot be attained the Code states, in Sentence 3.4.2.5.(2), that exits can be provided at 60 m intervals around the perimeter of the building with aisles leading directly to these exits. In considering these two choices of compliance with the Code, he finds the Applicant's proposal to use the Code provisions developed for retail mall uses to be unacceptable.

He submitted that a train using the rail siding will reduce the 9 m corridor width and, moreover, the train cars will be filled with combustible paper products. When considering the use of a public corridor in a mall situation, each store unit would be separated from one another, thereby providing

some compartmentalization should a fire occur. In this case there is not a separation between any area within the large building. The Respondent submitted that the logical solution would be to have the train uncouple allowing unimpeded access to the perimeter exit doors.

In summation the Respondent submitted that there is a considerable difference between 45 m and 105 m. If this proposal is approved he suggested that it would be a significant deviation from the Code requirements. He argued that travel distance is a passive fire safety measure. Compensation with an active measure, such as the proposed air handling system, in his opinion, would not off set benefits of a shorter travel time. To allow such compensation would be beyond the realm of what the Code permits.

7. Commission Ruling

It is the decision of the Building Code Commission that the access to exit designed using a combination of the provisions outlined in Clause 3.4.2.5.(1)(d) and Sentence 3.4.2.5.(2) of the Ontario Building Code does not provide sufficiency of compliance within a Group F, Division 2 occupancy at the Creditstone Industrial Building, Blocks 16, 17 and 18 on Plan 65M - 2696, Vaughan, Ontario.

8. Reasons

i) Notwithstanding the fact that the building is occupied by one tenant, the corridor adjacent to the railway line could be considered a public corridor in accordance with 3.4.2.5.(1)(d), however, the use of a corridor could not replace the requirement for exits located at 60 m around the perimeter of the building.

ii) The additional ventilation to be provided by way of an air handling system in the vicinity of the corridor is not adequate to achieve sufficiency of compliance in lieu of the exit doors at 60 m intervals as required by the Ontario Building Code.

DATE OF RULING
March 15th, 2001

APPEARANCES
Mr. William (Bill) Zlepnig, President
Southway Inn
Ottawa, Ontario
The Applicant

RULING

1. The Applicant

Mr. William (Bill) Zlepnig, President, Southway Inn, Ottawa, Ontario, has received a building permit under the Building Code Act, 1992 and is currently constructing an addition to the Southway Inn, 2431 Bank Street, Ottawa, Ontario.

2. Description of Construction

The Applicant is presently constructing a new six storey, 75 room addition onto an existing two storey, 102 unit hotel for a total of 177 rooms. When completed, the enlarged Group C - residential occupancy will be six stories in building height, 5,238 m^2 (56,360 ft^2) in building area and will be of noncombustible construction.

The construction in dispute involves the proposed water closet fixtures the Applicant intends to install in all of the washrooms in the guest rooms of the new hotel addition. Instead of six litre flush toilets, the Applicant is proposing to use water closets that have a maximum flush cycle of 13.25 litres.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the 13.25 litre water closets, proposed to be installed in the washrooms of the new hotel addition, provide sufficiency of compliance with Sentence 7.6.4.2.(3) of the Ontario Building Code at the Southway Inn, 2431 Bank Street, Ottawa, Ontario.

This provision stipulates that the flush cycle for water closet and urinal fixtures shall not exceed the limits prescribed in Table 7.6.4.2.B. For tank type water closets, this Table sets out that six litres is the maximum volume per flush cycle. The exemption to Sentence (3) is found in Sentence (2) of this Article. It permits a replacement fixture for one that existed before January 1, 1996 to conform to Table 7.6.4.2.A., which allows a 13.25 litre maximum flush for a tank type water closet.

At dispute therefore is the Applicant's proposal to use 13.25 litre toilets, not six litre toilets, in the new washrooms of the hotel he is currently constructing.

4. Provisions of the Ontario Building Code

Sentence 7.6.4.2. Plumbing Fixtures

3. Except as provided in Sentence (2) the flush cycle for each fixture that is a water closet or urinal shall not exceed the maximum flush cycle for that fixture listed in Table 7.6.4.2.B.

5. Applicant's Position

The Applicant submitted that he is fully aware that the Ontario Building Code requires him to install six litre toilets in the new addition at his hotel. However, he wishes to install 13 litre toilets for the simple reason that, in his view, six litre toilets fail frequently and cannot be relied upon to perform consistently. To support his claim regarding the inadequacy of six litre toilets, the Applicant indicated that he had assembled significant amounts of data both through his own analysis and through the experience of others.

The Applicant stated that the problem with six litre flush toilets first came to his attention at his church. All the churches' toilet were replaced with 13 litre ones. It was this situation that caused him to think seriously about the kind of toilet he would install in his hotel expansion.

With respect to his own research on this issue, the Applicant indicated that he conducted a four week experiment as to the reliability of six litre toilets using a lavatory at his own hotel as the testing facility. He summarized his experiment and its results as follows:

"The existing toilet of 1983 (18-20 litre water closet), situated in a medium-to-high use lavatory, was replaced on January 11 2001 at 11:30 a.m. with a new 6-litre toilet. At 2:30 p.m. that same day we experienced our first plugged toilet. Over the next four-week period we experienced sixteen different such instances (attachment 1) where this new 6-litre toilet failed to meet the ability of its predecessor. Therefore, it was removed on February 7, 2001 and replaced with a 13-litre American Standard (Plebe model). This was a water savings of approximately 5-8 litres of water compared to the model of 1983. Since the new 13-litre toilet has been installed we have not experienced any such plugs or overflows.

"In conclusion, the 6-litre toilet installed, plugs and overflows on a regular basis, posing an inconvenience to guests as well as a health threat to our employees whereas the American Standard 13 litre (Plebe) is performing without plugging or overflowing eliminating all health hazards and at the same time there is a water savings of 5-8 litres."

In addition to this study, the Applicant noted that he also conducted a camera investigation from inside the sewer line to determine where the plugging was occurring and how. The pictures showed that the blockage was in the toilets. They also showed that the problem relates directly to the fact that the throat diameter of six litre toilets have been reduced to maintain water velocity with the reduced amount of water. But the narrower throat then causes friction, especially in the trap. This forces a separation of the liquids and solids. The end result is blockage. To rectify this situation, a second and third flush are sometimes necessary. If this becomes the case, as the Applicant argued, all water savings intended by utilizing six litre toilets are negated. Indeed, the reduction from 20 to 13 litres resulted in a savings of water with functional toilets, but the reduction to six litres has not really achieved either.

By way of background, the Applicant stated that prior to applying to the BCC he had been in touch with Code Advisors in the Housing Development and Buildings Branch of the Ministry of Municipal Affairs and Housing. As the government body responsible for developing and administering the OBC, they instructed him that six litres was the requirement for his project and that the exemptions in Sentence 7.6.4.2.(2) do not apply in his case. They also noted that the OBC provision referenced a standard developed by the Canadian Standards Association (CSA) CAN/CSA-B45.0, "General Requirements for Plumbing Fixtures". In order to meet this standard, manufacturers had to ensure that their water closets passed a CSA performance test. If he wanted more information about the CSA standard, they offered that he could contact CSA directly.

The Applicant continued that he did get in touch with CSA and, in fact, went to one of the meetings of the CSA committee responsible for the water closet standard. He indicated that he presented his concerns to the committee. He explained that his problem with the CSA standard is twofold. First, the testing involved does not use real life situations. As the Applicant stated; "golf balls and beer caps (which are used in the CSA test) don't replicate the real deal." Secondly, directly related to this is that the standard does not guarantee that a toilet will work, i.e., meeting the standard provides no assurance that the fixture functions in real life. Apparently all that meeting the standard means is that the water closet has passed a test, not that it works. But the point of the test is to determine if the fixture functions, otherwise why have a standard at all? From a consumer protection point of view, the Applicant argued that the CSA standard is not doing its job.

The Commission was informed by the Applicant that CSA is reviewing their CAN/CSA-B45.0 standard. As he elaborated, CSA is studying whether to establish a different grading system whereby toilets would be rated in terms of how well they performed on CSA's flush test. As well, CSA is investigating the value of creating use classifications for water closets. This system would indicate whether a toilet was suitable for institutional, commercial or residential and whether it was appropriate for high, medium or low usage. The Applicant stated that he thought such refinements to the standard would be quite helpful.

In response to a question from the panel, the Applicant admitted that he has tried only one type of six litre water closet. He countered, however, that as a consumer he does not have the resources to investigate all the toilets on the market to get one that works and is right for his uses. At the time he purchased the water closet he was assured by the plumbing supplier that he was buying the best. Besides, he should be able to have certainty that the current regulatory system ensures that the toilet he buys works. After all, buying a toilet should not be a crap shoot.

In answer to a question regarding whether he had installed six litre toilets with pressure assist devices, the Applicant said that he had not done so in his hotel, but had seen them elsewhere. He admitted that such devices work, but noted that they are expensive and are yet another device that must be maintained at additional cost. He also asserted that pressure assists are not appropriate for hotel uses because they are fairly loud and may cause disturbances for the guests.

The Applicant then turned his attention to the extensive amount of material he had gathered from numerous other individuals and organizations that supported him in his application to the BCC. The letters were from other hotels (some even offered their own service record showing many blocked toilet calls), hotel associations, seniors residences, sewer contractors, various engineers, homeowners and car dealerships. There were also supportive newspaper and magazine articles. All of this documentation

essentially contained the same argument - that new six litre toilets do not work well and when replaced with 13 litre fixtures the blockage problems were eliminated.

One letter in particular the Applicant felt he wanted to highlight to the Commission was from the City of Ottawa. It discussed a situation where they converted the six litre toilets installed in 1998 in the new wing of the Centre d'accueil Champlain to 13 litre toilets. The letter stated:

"At that time, the Region requested these toilets be changed to a higher model (18 ? inches) to accommodate the needs of our elderly clients who were finding it difficult to transfer on and off our low toilets. We had also been experiencing problems with blockages and overflow spillage. Due to lack of funds, we had to wait until year 2000 to proceed.

"Sometime last year (2000), our plumbing contractor changed those 85 American Standards... to American Standards with a tank of 13 litres only because an 18 ? inches high toilet with a 6 litre tank was not available."

While the Applicant confirmed with technical advisors from the Ministry present at the hearing that such models are available, he argued that his point was the City, the entity responsible for OBC enforcement, also does not seem to support the use of six litre water closets. (As an aside, the Applicant noted that many of letters submitted on his behalf were seeking a Code amendment regarding the six litre flush. While he acknowledged that the BCC cannot amend the OBC, he nevertheless reiterated that all of the writers had negative experiences with the water closets currently permitted.)

The Applicant then discussed the specific Code reference directly. He offered two arguments concerning Article 7.6.4.2. One, he noted that there are exemptions allowed in Sentence 7.6.4.2.(2) from utilizing six litre toilets in certain uses. These uses are heritage buildings, certain institutional facilities and passenger terminals. Except for heritage structures, the Applicant argued that the Sentence (2) exemptions are buildings where for health or high demand reasons a toilet must be counted on to flush every time and therefore a 13 litre fixture is permitted. The corollary of this is that in less critical uses such as residential, the Code allows, in fact requires, less than peak performance toilets in Sentence (3). The very existence of the exemptions is tantamount to an admission that six water closets are not entirely reliable, the Applicant insisted.

He followed this by arguing that because of the special circumstances of the hotel industry - guests are paying to use their residential space - that they should also be exempt. Their business depends on a quality accommodation and a backed up toilet can ruin that experience.

Having poorly performing toilets in every single newly built guest room is a definite hardship on the hotel industry, which is a very competitive business where even the slightest item can become an advantage, or in this case, a disadvantage. The very slight water conservation these toilets ostensibly offer has been gained at the expense of cost effectiveness due to high maintenance and potential lost revenue from unsatisfied customers.

In conclusion, the Applicant stated that if not all toilets are created equal, but the manufacturer nor CSA will indicate which ones are quality, then how can a consumer find out what is the best, or simply the appropriate water closet for their intended installation. He reiterated that he felt there is a problem with the testing procedures because they are not protecting the public. And lastly, he indicated that a grading system as well as a classification system would be very helpful.

6. Respondent's Position

The Respondent party chose not to attend the hearing. The Commission therefore relied only on their written submission.

In their supporting documents, the Respondent expressed a degree of sympathy toward the Applicant's position regarding six litre toilets. As they stated; "we acknowledge the concerns raised and your reluctance to install fixtures that have the potential to cause considerable disruption to your business and service to the public." They also thanked the Applicant for the investigation he carried out and for bringing the matter to them.

The Respondent submitted, however, that they have "no authority to approve the installation of fixtures other than those specified by the Ontario Building Code." They explained that, in their view, the intent of OBC 7.6.4.2. is water conservation, an initiative undertaken by the provincial government. The Respondent noted that the National Plumbing Code has no parallel requirement.

Finally, they suggested that the Applicant apply to the BCC and stated that "the municipality would offer no objections to your submission (to the BCC), but would merely make a statement concerning our limited authority."

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed use of 13.25 litre water closets in the new hotel addition provides sufficiency of compliance with Sentence 7.6.4.2.(3) of the Ontario Building Code on condition:

a. That for each 13.25 litre toilet proposed to be installed in the new hotel wing in lieu of a six litre water closet, a 20 litre toilet in the existing portion of the building be removed and replaced with a 13.25 litre water closet; and,
b. That the work described above, retrofitting water closets in the existing hotel, be completed prior to occupancy of the new wing.

8. Reasons

i. Sentence 7.6.4.2.(3) and Table 7.6.4.2.B. of the OBC address the requirements for water closets in new construction. As the standard for new construction, at six litres, is lower than for existing fixture retrofit, at 13.25 litres, it appears that this provision has two objectives. One, that new construction must meet a more rigorous standard than renovation, and two, that new buildings must achieve a higher level of water conservation. In the present circumstance, a new structure is being added onto an older facility. We hold that with fulfilment of the attached conditions, the overall water usage by all toilets in the entire building will be similar to that if the Applicant had installed six litre fixtures in the new wing. In this manner, the retrofit of an equal number of existing toilets will provide for water conservation as intended by OBC 7.6.4.2.(3) and thereby achieve appropriate compensation.

Designate for the Respondent

RULING

1. The Applicant

The Roman Catholic Episcopal Corporation for the Diocese Holy Family Parish, Toronto, Ontario, has received a building permit under the Building Code Act, 1992 and has extended an existing church building at the Holy Family Church, 1372 King Street West, Toronto, Ontario.

2. Description of Construction

The Applicant has added new worship space to an existing church building. The enlarged structure is classified as a Group A, Division 2 - Assembly occupancy. The existing building is one storeys in building height and of combustible construction, whereas the new addition is two storeys in building height and of noncombustible construction. Together, the two portions occupy a building area of 1747 m^2 and are equipped with a fire alarm system.

The recent construction at the site involved the erection of a new church building to the west of the existing church and rectory. The existing and new portions are linked by two separate single storey sections, one at the north and one at the south of the building. Two air condition units (one on each) have been located on top of these one storey linking sections. A single unprotected window is located at the second floor level of each of the walls formed where the new two storey church abuts these single storey sections.

The construction in dispute involves the clearance distances between the two rooftop gas-fired air conditioning units installed on the low level roofs adjacent to the second floor exterior walls of the new church. Specifically, the unit located on the roof of the north linking section is situated directly in front of and 2.5 m away from a window in the western wall of the new church. If measured from the centre line of the burner component of the air conditioner, the distance to the window and wall is 3.0 m.

For the unit located on the roof of the south linking section, the nearest wall face measured at right angles to the air conditioning unit is 1.8 m away. The window in this wall is not positioned directly in front of the air conditioner, therefore the distance is measured from the nearest corner of the window to the nearest corner of the unit. This corner to corner separation is 2.3 m, and as measured to the centre of the unit, the distance is 3.1 m. Unlike the appliance installed on the north side, there is a shingled roof of the existing building in close proximity to the unit installed on the south low roof.

The Applicant is proposing to provide a heat shield between each unit and the adjacent opening to avoid the spread of a possible appliance fire.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the as-installed fuel fired appliances, a portion of each having been situated within 3 m of exterior walls of the same building

which contain openings, provide sufficiency of compliance with Clause 6.2.5.2.(1)(c)of the Ontario Building Code.

Clause 6.2.5.2.(1)(c) requires that a fuel-fired appliance installed on a roof must be set back at least 3 m from an adjacent wall of the same building if that wall has an opening(s) within either three storeys above 5 m horizontally of the subject appliance. However, this requirement can be waived if such openings are protected by a closure assembly having either a Code recognized 45 minute fire protection rating, or wired glass installed as required by Code. As installed, the subject appliances have a distance of less than 3 m with the adjacent walls and their openings (windows). The windows are unprotected and located less than three storeys above the subject appliances.

4. Provisions of the Ontario Building Code

Clause 6.2.5.2. Appliance Installed Outside the Building

1. Fuel-fired *appliances* installed on the roof of a *building* or otherwise outside the *building* shall be

    c. installed not less than 3 m (9 ft 10 in) from an adjacent wall of the same *building* when such wall contains an opening or openings within 3 *storeys* above and 5 m (16 ft 5 in) horizontally from the *appliance*, unless such openings are protected by a closure assembly having a 45 min *fire-protection* rating determined in conformance with Article 3.1.8.4., or by wired glass conforming to Article 3.1.8.14.

5. Applicant's Position

The Agent for the Applicant submitted that the installation of the rooftop units provides sufficiency of compliance with 6.2.5.2.(1)(c) of the Ontario Building Code. He stated that it is only the metal housing of the gas-fired air conditioning units that are actually too close to the adjacent walls and their openings. The burners themselves within the units, he argued, are 3 m from the walls. Moreover, the blower for the units points 180^0 in an opposite direction from the walls.

The Agent continued that the wired glass required by Code to provide protection to the openings would be costly to install. The closure assemblies were also ruled out because the subject windows are decorative and the closures would detract from their appearance. He indicated, however, that the Applicant would be prepared to install a three-sided heat shield made of reflective metal around the appliances for additional protection in case of fire or explosion.

The Agent concluded by reiterating that with the burner sections of the rooftop air conditioning units being at least 3 metres from the adjacent walls and by installing the proposed heat shield, it was his position that the installation of the subject appliances meets the intent of the separation distance required in the OBC.

6. Respondent's Position

The Respondent stated that the original structure of the subject building was destroyed by a fire. As a result, vigilance should be applied to this building with respect to its fire safety. In this regard, the Respondent felt it important to note that besides there being inadequate clearance distance between the rooftop gas-fired appliances and the adjacent walls and their openings, there is also combustible roof material within a certain radius of the south unit. He did acknowledge, however, that the situation represented a difficult and tight installation.

The Respondent concluded that he is prepared to accept the proposed heat shield as a compensation measure, however, he would like to see the drawings of the proposal first.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-installed fuel fired appliances, a portion of each having been situated within 3 m of an exterior wall of the same building which contains openings, provide sufficiency of compliance with Clause 6.2.5.2.1.(1)(c) of the Ontario Building Code at the Holy Family Church, 1372 King Street West, Toronto, Ontario, on the condition that:

d. The units be provided with a heat shield; and,

e. The heat shields be designed and installed to the satisfaction of the City of Toronto's Building Department.

8. Reasons

. The heat shields, once installed, will provide protection to the openings in the subject walls.

i. Considering the location of the actual burner portions within the air conditioning units, the separation is close to the required 3 m distance.

Agent for the Applicant

Mr. Frank Asta
Chief Building Official
Oakville, Ontario
The Respondent

RULING

1. The Applicant

Mr. Dan Vernescu, Property Manager, Town of Oakville, Ontario, has received a building permit under the Building Code Act, 1992 to renovate and construct an addition onto the Town of Oakville's municipal building located at 1225 Trafalgar Road, Oakville, Ontario.

2. Description of Construction

The Applicant is renovating and expanding an existing municipal building classified as having a Group D - Business and Personal Services occupancy. The building is two storeys in building height, 14,054 m^2 in building area (existing and new) and of noncombustible construction. The addition consists of a new office complex with an atrium (considered as an interconnected floor space) that provides a link to

the existing building. Both the existing building and the new addition are sprinklered and equipped with a fire alarm system and a standpipe and hose system.

The construction in dispute involves an installed under-slab air circulation system consisting of plastic duct piping. This pipe, known as "Big O", is made of reinforced high molecular weight, high density polyethylene and is approved as a sewer pipe for underground applications. The Applicant is proposing to use the disputed system as an air carrying facility that is to provide both air cooling and ventilation. As a result, the air temperature in the system will range from 13 to 30^0 C.

The subject combustible ducts are entirely confined within the newly constructed two-storey high atrium and are to serve only the same area. Specifically, the duct design consists of a central supply main that runs much of the length of the atrium and measures 915 mm (36 inches) in diameter. Five branch ducts 457 mm (18 inches) in diameter run from the main supply duct and terminate at vertical concrete plenums that are to pass the air up and through the floor slab. When completed, the upper (above slab) portions of the concrete plenums are to be incorporated into fixed bench seating located within the atrium. The air outlets, to be covered with low velocity metal grills, will be positioned 200 mm above the floor level, on the side of the benches.

At the supply end of the plastic ducts, the main duct will connect to a noncombustible (metal) vertical shaft that leads to the roof. A power-operated air handler located on the roof supplies the shaft, and thereby the entire system, with air. Part way down, the shaft will have a horizontal offset as air travels through the system.

The combustible pipes within the duct system therefore all run horizontally. The vertical elements of the system, the metal supply duct and the concrete plenums, are noncombustible.

In terms of fire safety, at the connection point between the vertical metal duct and the horizontal combustible duct a fire damper will be installed to provide fire stopping. The system will also be provided with heat and smoke detectors that, when actuated, will stop the operation of the supply fan.

According to the original drawings submitted for building permit, the under floor conduit was to be constructed of concrete. Later, during construction the concrete pipe was substituted with the reinforced Big O plastic piping.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed air distribution system that is comprised of under-slab combustible duct piping provides sufficiency of compliance with Article 6.2.3.2. of the Ontario Building Code.

Article 6.2.3.2. addresses materials that can be used in air duct systems. Sentence 6.2.3.2.(1) requires that all ducts, etc., be made of similar noncombustible materials. Sentence (2) provides an exemption to Sentence (1) if the criteria laid out in Clauses (a) to (f) are met. Since the proposed material does not fulfill these requirements, the exemption offered in Sentence (2) does not apply.

At issue therefore is wether the installed plastic duct piping at the Oakville Municipal Building, used as a portion of an air distribution system for cooling and ventilation purposes, provides sufficiency of compliance with OBC requirements mandating that air conduits must be noncombustible.

4. Provisions of the Ontario Building Code

Article 6.2.3.2. Materials in Air Duct Systems

1. Except as provided in Sentences (2) to (4) and in Article 3.6.4.3., all ducts, duct connectors, associated fittings and *plenums* used in air duct systems shall be constructed of similar *noncombustible* material.
2. Ducts, associated fittings and *plenums* are permitted to contain combustible material provided they
    i. conform to the appropriate requirements for Class 1 duct materials in CAN/ULC-S110-M, "Standard Methods of Test for Air Ducts",
    ii. conform to Article 3.1.5.14. in a *building* required to be of *noncombustible construction*,
    iii. conform to Subsection 3.1.9.,
    iv. are not used in horizontal runs in a *building* required to be of *noncombustible construction*,
    v. are not used in vertical runs serving more than 2 storeys in a *building* required to be of *noncombustible construction*, and
    vi. are not used in air duct systems in which the air temperature may exceed 120C (248F).

5. **Applicant's Position**

The Agent for the Applicant submitted that the proposed duct material is "safe, functional, durable and potentially superior" to the type of materials addressed by the Code. In his view, it meets and exceeds the intent of Code requirements. As a result, he argued that the substitution of the Big O material "does not violate the terms and conditions of the building permit." (Although he did acknowledge that the contractor was "proactive" in terms of the pipe installation.) The Agent then stated he would focus his arguments along the following themes; safety, functionality and "approvability".

Regarding the safety of the Big O product, the Agent indicated that the proposed ducts are used extensively as thermo-plastic conduits, drainage piping or culverts in buried applications. These installations, he argued, have just as much potential exposure to exterior fires as can be anticipated for those in the Oakville Municipal Building. The Agent noted that, to his knowledge, he is not aware of any incidents nor failures in this regard to date.

The Agent continued that, in addition to sprinklering of the entire building and having a smoke control system in the atrium, additional fire safety measures are proposed in connection with the proposed air duct system. Included in these measures is the installation of a fire damper at the connection between the vertical supply shaft and plastic ducts (to be located at the floor line) to separate the combustible portion of the subject air supply system from the remainder of the building. The system also contains a heat and smoke detectors that will shut down air movement in case of a fire. The Agent also argued that the system is safe because the plastic portion is buried within ground and under concrete and is thereby protected from direct heat radiation (if a fire were to occur) and other exterior influences.

Moreover, the chance of a fire occurring in the pipe is remote, the Agent stated. All portions of the system above ground are noncombustible. The outlet grills in the plenums, located 200 mm above the floor level, protect the exhaust end of the system from refuse and combustibles. At this height, no materials such as cigarettes can get swept into the system. As well, the plastic pipes have no heat source and no fuel load, except the pipe itself.

The pipe is also safe with respect to microorganism growth. As he argued, concrete is porous and allows fungal contamination. The Big O has no porosity and therefore "is completely immune from colonization of microorganism such as fungii (sic)." The Respondent's claim that the corrugated form of the pipe creates grooves on the interior is not true. The pipe is smooth on the inside. It is only the exterior that is corrugated to provide structural strength. There are no grooves inside the pipe where water could accumulate and cause microorganism growth. Besides, any water that may get into the system would evaporate when in operation.

Regarding the functionality of the pipe, the Agent argued that the Big 'O', as a sewer pipe, has been designed to withstand the same soil pressures for underground applications as the one in dispute. In addition, these pipes have a life expectancy of 65 years above ground and ageless when buried underground. The durability of the material was supported by a representative of the Big O product that attended the hearing.

As far as the approvability of the subject material is concerned, the Agent noted that the Big O pipe is very common and is used extensively. He noted, however, that the OBC does not seem to directly address the use of products such as the Big O for this type of application. Instead, for under floor air distribution systems it seems to rely extensively on referenced standards. These standards, however, he indicated support the use of under floor plastic air ducts. Indeed, ASHRAE, SMACNA, NFPA 91 and the International Mechanical Code Issue 2000 all endorse the use of material (as found in the Big O) as appropriate for the disputed application.

As the Agent argued, if the subject air system were to be viewed as part of the floor, it appears to conform to Code requirements for under floor air distribution systems. It also complies with provisions in the Code that require non-metallic (plastic) components of duct systems to have operating temperatures of up to 49^0 C. As he noted, the installed material is approved for an operating temperature of 60^0 C or higher.

The Agent concluded by stating that the ultimate goal of the air system in dispute was to achieve functionality, while providing safety. It is his belief that the duct system is very safe. It is a single use duct to serve a single space within a building that is sprinklered. The fire safety intent of the OBC therefore has been met. The Big O product is appropriate in this application, the Code simply does not address such usage at this point.

6. Respondent's Position

The Respondent submitted that the plastic pipes, used as air distribution ducts, are combustible and therefore do not meet Article 6.2.3.2. of the Code. Specifically, the Big O pipe does not qualify under the exemptions to the noncombustible material requirement (Sentence 6.2.3.2.(1)) found in Sentence 6.2.3.2.(2). The flame spread rating and the smoke development classification for the product exceed the permitted limits for air distribution systems set out in the CAN/ULC S110-M Standard, which is referenced by the OBC.

The Respondent argued that the pipe has not been tested for the use proposed by the Applicant as air duct system. Article 6.2.3.2. does allow combustible materials to be used in air carrying facilities,

however these systems must comply with certain standards. This system does not. He noted that, to his knowledge, no other examples exist in which this material is employed for air handling. In fact, the Respondent explained that he had contacted the manufacturer of the product who indicated that they did not recommend the Big O system for use as air ducts. In addition, there is no evidence to prove the equivalency of the proposed material to those addressed by the Code.

The Respondent stated that his main concern is that the subject combustible air duct system will serve a large atrium space that can accommodate between 300 to 400 people. And since the duct system contains a considerable amount of pipe, an extensive volume of combustible material has been introduced into the atrium. He noted that the Fire Department of Oakville has expressed concern regarding this increased fuel load, in particular the potential amount of deadly CO^2 (carbon dioxide) that could be released into the building if the duct system were ever to ignite.

The pipe also appears to be corrugated on its interior, the Respondent noted. Such grooves may allow for the accumulation of moisture. This in turn may lead to the production of bacteria and other organisms, such as Legionnaires Disease.

The Respondent concluded by indicating that this change of pipe product was not shown on the plans submitted for permit and was not discussed and approved prior to installation. Lastly , he stated that the duct piping neither complies with Code requirements, nor does it meet the level of fire safety intended by the OBC.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed air distribution system comprised of under-slab combustible duct piping provides sufficiency of compliance with Article 6.2.3.2. of the Ontario Building Code at the Oakville Municipal Building, 1225 Trafalgar Road, Oakville, Ontario on condition that:

a. The duct system serves only the atrium; and,
b. The duct system be used to convey only ventilation air and air-conditioned (cooled) air, and not for any other purpose.

8. Reasons

i. The subject duct plays a limited role in the total air carrying of the building.

ii. There are no structural concerns related to this application.

iii. The atrium will be provided with an engineered smoke control system.

iv. This particular installation does not present a fire hazard since the duct is completely buried under the floor slab, the supply duct to the underground duct is noncombustible and equipped with a fire damper, and air is discharged into occupied areas through noncombustible plenums.

Dated at Toronto this **15th,** day in the month of **February,** in the year **2001** for application number **2001-11**.

RULING

1. The Applicant

Mr. Larry Law of the Law Development Group in Thornhill, Ontario, has applied for a building permit under the Building Code Act, 1992 to construct freehold residential townhouses, known as the Bur Oak Townhouses, located on Bur Oak Avenue, in the Cornell Community, Markham, Ontario.

2. Description of Construction

The Applicant is proposing the construction of four blocks containing a total of 34 Group C - residential townhouses. The townhouse blocks are proposed to be a maximum of three storeys in building height.

They are to be of combustible construction and have access to two streets. Most of the townhouses are to contain two separate freehold dwelling units each ranging from 83.61 m^2 to 130.06 m^2 in floor area.

The construction in dispute involves two main areas; fire separation between units and the sharing plumbing services. These disputes arise as a result of the stacked design of the townhouses whereby one unit sits mainly over top of another. Each unit has split levels and has its own at-grade front door and garage, in the front and rear yards respectively. As a result of the stacked design, a property line within the townhouse would be created on both vertical and horizontal planes between each dwelling unit. It is intended that the walls and/or floors occurring at the property lines that are shared by two units will be constructed with a suite-to-suite fire separation having a 1 hour fire-resistance rating.

With respect to the sharing of plumbing services, the Applicant is proposing to service the two freehold units in each townhouse with a single connection to the municipal services. As well, because of the stacked design of the units within the townhouses, the plumbing systems cannot be located exclusively within each individual unit. In addition, unlike in a condominium development or apartment complex, there are no common spaces within the townhouses through which plumbing services could be run. To address this situation, the Applicant is offering to implement reciprocal agreements and mutual easements respecting access to neighbouring dwelling units for repair and maintenance purposes, etc.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed stacked townhouse units, with property lines occurring on both horizontal and vertical planes between them, comply with the requirements of Sentences 9.10.11.1.(1), 7.1.6.4.(1) and 7.1.7.2.(1) of the Ontario Building Code.

Sentence 9.10.11.1.(1) of the Code requires, with certain exceptions, that party walls on property lines be constructed as firewalls. Sentence 9.10.11.2.(1) outlines one of the circumstances where such a firewall would not be required. It states that, in a residential building where no dwelling unit is located above another dwelling unit, a party wall is permitted to be constructed as a fire separation with a 1 hour fire resistance rating. In the subject situation, as freehold stacked townhouses, units are located upon others and yet, the demising partitions are proposed as 1 hour rated walls and floors. (It should be noted that, as the proposed unit-to-unit configurations are comprised of both horizontal and vertical separations, the concept of party wall is being extended to the separating floor assemblies as well.)

Sentences 7.1.6.4.(1) and 7.1.7.2.(1) deal respectively with the design and installation of piping and the accessibility of fixtures, plumbing appliances, equipment etc. Specifically, Sentence 7.1.6.4.(1) requires that piping in a building be connected to the public services separately from the piping of another

building. As noted, the Applicant is intending that both units within each townhouse be legally parcelled and sold as separate properties. The proposed plumbing services, however, are to be shared within each townhouse. Whereas the sharing of plumbing services is common between units in apartment or condominium buildings, it is not permitted between buildings.

Sentence 7.1.7.2.(1) requires that plumbing fixtures etc., be installed so that they are accessible. However, since there is no common space devoted for utilities such as plumbing, it may be necessary to enter one unit to provide service to the other. In lieu of common service spaces, the Applicant has proposed to create binding legal agreements with easements to allow for servicing. Nevertheless, such easements are not addressed in Article 7.1.7.2. of the OBC.

For this development, in determining the construction and life safety requirements, the Applicant has considered the entire block of townhouse units to be one building for the purposes of the Code. The Building Code requirements are proposed to be applied to the group of dwellings rather than the ownership of individual units.

4. Provisions of the Ontario Building Code

9.10.11.1. Required Firewalls

1. Except as provided in Articles 9.10.11.2. and 9.10.11.4., a *party wall* on a property line shall be constructed as a *firewall*.

9.10.11.2. Firewalls Not Required

1. In a *building* of *residential occupancy* in which there is no *dwelling unit* above another *dwelling unit*, a *party wall* on a property line between *dwelling units* need not be constructed as a *firewall* provided it is constructed as a *fire separation* having not less than a 1 h *fire-resistance rating*.

7.1.6.4. Separate Services

1. Piping in any *building* shall be connected to the public services separately from piping of any other *building*, except that an ancillary *building* on the same property may be served by the same service. (See Appendix A.)

7.1.7.2. Accessibility

1. Every *fixture*, *plumbing appliance*, *interceptor*, *cleanout*, valve, device or piece of equipment shall be so located that it is readily *accessible* for use, cleaning and maintenance.

5. Applicant's Position

The Applicant submitted that, with the townhouse complex designed to function as one building, the requirements of the Building Code would be met. In this regard, the provisions of the Code would permit walls occurring at a property line to be constructed as a suite-to-suite fire separation. In his opinion "life safety and fire protection requirements are satisfied based upon the relative orientation of dwelling unit to dwelling unit within a building rather than upon the ownership of the individual dwelling unit." In light of this, walls and floors constructed with a 1 hour fire separation of combustible construction would meet the intent of the Code.

The Applicant's position was that the project would provide "a level of life safety equivalent to that which would be found within other multi-unit buildings such as condominiums". He stated that, with respect to the issue of services and accessibility, the reciprocal agreement and mutual easements proposed would satisfy the requirements of the Code. These agreements would alert individual owners to all of the limitations and requirements of purchasing this type of unit. In addition, the agreements could be registered on title for the benefit of any future owner. He also suggests that a Homeowners' Association would be established to enforce access to units for servicing purposes.

In support of their position, the Applicant referred to previous Building Code Commission (BCC) rulings that address the concept of buildings being constructed across property lines where no fire walls were required. As he noted, "(i)n these rulings, the BCC found that these could be treated as one building since they functioned as one building and since agreements were in place regarding the function of the building."

6. Respondent's Position

The Respondent submitted that their primary difficulty with this project is the fact that the units are being offered for freehold ownership. The two issues that present concern are; 1) the requirement of party walls and, 2) the location of the plumbing piping between and throughout the units.

On these issues the Respondent put forward the following arguments:

"In the case of the proposed building, the walls and floors are located on property lines that separate individually owned properties. By virtue of their location (ie. on the property lines) and shared

ownership, these walls by definition must be considered party walls. As such, Sentence 9.10.11.1.(1) requires the party walls to be designated as firewalls. Furthermore, notwithstanding the absence of specific requirements pertaining to the unusual location of floors on property lines, similar standards should apply to the design and construction of the floor assemblies in my opinion.

"The provisions of Sentence 9.10.11.1.(1) require party walls to be constructed as firewalls except that the standards applied to party walls can be relaxed in accordance with the requirements of Article 9.10.11.2. in buildings of residential occupancy where there is no dwelling unit located above another dwelling unit. The proposed buildings contain dwelling units located above other dwelling units.

"The applicants proposal is based on the premise that the building will be designed and operated as an integral unit through the establishment of a 'Homeowners' Committee'. The legal basis for the existence of the 'Committee' is unclear as is the relationship between each homeowner and each homeowner and the Committee. Furthermore, the implementation and enforceability of the conditions contained within the 'Reciprocal Agreements' is unclear and is not addressed by the code.

"It is unclear whether the provisions of the 'Reciprocal Agreement' proposed by the applicant provides the level of accessibility to fixtures, plumbing appliances, interceptors, cleanouts etc. required by Sentence 7.1.7.2.(1) of the code."

In reference to the prior BCC rulings advanced by the Applicant, the Respondent cited that the difference between those cases and the proposed development is that the previous decisions were with respect to large commercial buildings. In those instances full scale maintenance agreements were put in place. In this case there is only a reciprocal agreement and easements with no extra protection for the access to, and maintenance of, systems proposed.

In summation, the Respondent advised that they could foresee difficulty with respect to the enforcement of the agreements, in light of the freehold ownership of the units in question. If the townhouses were developed for condominium ownership, the Respondent's position may have been different. In that situation, condominium buildings would have common areas, with ownership by the Corporation, where plumbing could be situated.

7. Commission Ruling

It is the decision of the Building Code Commission that the residential townhouse development at the Bur Oak Townhouses on Bur Oak Avenue in the Cornell Community, Markham, Ontario does not comply with the requirements of Sentences 9.10.11.1.(1), 7.1.6.4.(1) and 7.1.7.2.(1)

8. Reasons

i. In this particular townhouse development, since dwelling units are proposed to be located over other dwelling units, the exemption from constructing a party wall as a firewall found in Sentence 9.10.11.2.(1) is not applicable. The 1 hour rated separation allowed in that Sentence and proposed between the freehold units within the townhouses, therefore, is not permitted.

ii. Moreover, since the townhouses consist of stacked dwelling units, a firewall is required between the townhouses because they too do not qualify for the exemption in Sentence 9.10.11.2.(1).

iii. The OBC does not recognize a horizontal firewall between suites. As a result, the subject residential townhouses cannot have freehold units stacked above one another.

iv. Plumbing serving an individual freehold unit must be separate from the municipal mains to the unit and also within that unit from the plumbing serving another such unit.

v. Plumbing fixtures must be accessible. While the proposed easement agreement does offer legal access to service the plumbing, it does not provide direct physical access as would be found in a freehold building or in the service spaces of an apartment or a condominium building.

Dated at Toronto this **15th,** day in the month of **February,** in the year **2001** for application number **2001-09.**

Ontario

Ruling No. 01-04-797
Application No. 2000-82

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Sentences 3.2.1.1.(3), (4), (5) and (6) Article 3.2.2.24., Sentence 3.2.8.2.(1), Article 3.4.2.2. and Clause 3.4.2.5.(1)(c) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Harry Cavender, Team Leader, Fanshawe College, London, Ontario, for the resolution of a dispute with Mr. Jim Foster, Chief Building Official, City of St. Thomas, Ontario, to determine whether the proposed mezzanine, upper mezzanine and grid iron areas intended for a live performance teaching facility, in conjunction with certain additional protective measures, provides sufficiency of compliance with Article 3.2.2.24., Sentences 3.2.1.1.(3),(4) and (5), Sentence 3.2.8.2.(1), Article 3.4.2.2. and Clause 3.4.2.5.(1)(c) of the Ontario Building Code at the Fanshawe College "Live Performance Industry" Facility, St. Thomas / Elgin Campus, 120 Bill Martyn Parkway, St. Thomas, Ontario.

APPLICANT	Mr. Harry Cavender, Team Leader Fanshawe College London, Ontario
RESPONDENT	Mr. Jim Foster Chief Building Official City of St. Thomas
PANEL	Dr. Kenneth Peaker, Chair Mr. John Guthrie Mr. Fred Barkhouse
PLACE	Toronto, Ontario
DATE OF HEARING	February 8th, 2001
DATE OF RULING	February 8th, 2001
APPEARANCES	Ms. Valerie M'Garry Solicitor London, Ontario **Agent for the Applicant** Mr. Jim Foster Chief Building Official St. Thomas, Ontario **The Respondent**

RULING

1. The Applicant

Mr. Harry Cavender, Team Leader, Fanshawe College, London, Ontario, has received a building permit under the Building Code Act, 1992 and is constructing an addition onto the existing Fanshawe College building, St. Thomas / Elgin Campus, 120 Bill Martyn Parkway, St. Thomas, Ontario.

2. Description of Construction

The Applicant is proposing to construct a live theatre performance teaching facility onto an existing college structure. As a teaching space, the addition has been classified as a Group A, Division 2 - assembly occupancy, and not as an A1 use, which is applicable to most theatres. The addition, to the north of the existing building, with a building area of 1,259 m^2, combined with the 10,580 m^2 building area of the existing structure will create an expanded facility of 11,839 m^2.

The building, including addition, is further described as being of noncombustible construction and as having fire separations with fire resistance ratings of one hour in accordance with the requirements of Article 3.2.2.24. The structure is considered as facing one street for fire fighting purposes. The building will be equipped with a sprinkler system and a fire alarm system, but not a standpipe and hose system.

Among the features provided within the proposed addition, which is known as the "Live Performance Industry" facility, there is to be a studio theatre (referred to as the studio). As an instructional facility, the studio is designed to be a legitimate theatre with a fully equipped stage, fly tower and control room, etc. However, because its purpose is mainly teaching students how to operate stage equipment, it is to have far fewer seats than a regular theatre. As such, the ratio of stage area to seating area in the facility is considerably smaller than a conventional legitimate theatre. Consequently, the mezzanine levels have a much larger percentage in terms of area in comparison with the size of the room/studio.

The studio is to be configured with the stage area located at the eastern end of the room. Immediately above the stage, covering nearly its entire area, will be the grid, or grid iron, level. Opposite the stage is to be the audience area that will accommodate the non-fixed seats. Above the audience area, at the farthest, or extreme western end of the studio, is to be the mezzanine, or control room. On top of the control room will be the upper mezzanine, or catwalk. A single flight of stairs running near the southern, stage left, side of the studio is to connect the upper mezzanine with the loading bridge. The loading bridge, in turn, will form the southern end of the grid iron. The loading bridge is designed to span the entire width of the grid and will terminate at a spiral stair that is to descend down all levels ending at the stage.

The determination of the number of storeys present in the studio, and thereby the building, is part of the dispute between the Applicant and Respondent. The Applicant holds that the building has remained at one storey despite the construction of the theatre space. In his view, the various levels of the studio should be considered as mezzanines. The Respondent believes the studio room within the theatre addition may contain multi storeys. From this basic dispute arises much of the following more specific concerns between the parties.

The mezzanine areas have three distinct levels: the grid, the upper mezzanine/catwalk, and the control room. None of these areas will be considered as being accessible by the public.

The grid (in front of the audience), the highest of the levels, is to be constructed mainly with an open 76 mm (3 in) steel mesh floor to allow good visual and oral communication between the flymen (those on the grid) and the stagehands below. There are to be five slots or channels 254 mm (10 in) wide, known as grid wells, that traverse the entire width of the grid (or depth of the stage). These are to accommodate the lift lines that will be used for rigging props, scenery etc.

At the proscenium opening, where the stage and auditorium area interface, the grid will be provided with an open steel guard that consists of a single horizontal rail measuring 1,070 mm (42 in) in height supported by vertical posts set at approximately 915 mm (3 ft) on centre. This guard, which is also to be used as a fixture to attach lighting, is not in dispute.

At its far southern end, or stage left, the grid will connect to the loading bridge which is an area that will be used for hoisting equipment between the stage and grid level. Due to the requirement of lifting material and equipment (in this side stage area where it will not be seen by the audience), the loading bridge, however, is to terminate approximately 915 mm (3 ft) short of connecting to the studio's south wall. At this edge, the loading bridge is to be provided with a guard having the same design as at the proscenium opening.

The catwalk (behind and above the audience) is to be positioned approximately 1.2 to 1.5 m (4 to 5 ft) below the level of the grid. The catwalk is intended to provide an area to conduct various theatrical effects, especially lighting. It will have a solid decking surface. At its rear, or western end, a single straight flight of stairs connecting to the control room level below is to be provided. The guard proposed to separate the catwalk from the open space overlooking the audience and the stair opening to the lower level will be the same as on the grid iron. The guard on the audience side of the catwalk will also be used for attaching lights.

The control room (behind and above the audience) is to be the lowest of the raised levels. It will contain three separate booths that are to house the main sound controls, lighting controls and the "follow spot light". As booths, the control room level will not have guards protecting persons from the differing floor levels, but will instead have mainly glazed partitions overlooking the audience. (The audience seating can be extended underneath the raised control room.) A two flight stair separated by a 90^0 landing will serve the control room area. As a stair with a right angle run, it is to be located at the rear and south of the control rooms.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed grid, catwalk and control room areas intended for use within a live performance theatre teaching facility, in conjunction with certain additional protective measures, provides sufficiency of compliance with Sentences 3.2.1.1.(3), (4), (5) and (6), Article 3.2.2.24., Sentence 3.2.8.2.(1), Article 3.4.2.2. and Clause 3.4.2.5.(1)(c) of the Ontario Building Code.

The first provision, Article 3.2.1.1., in certain circumstances, determines building height. Specifically, it provides exceptions when raised levels need not be considered as storeys. Applicable to the present case is Sentence 3.2.1.1.(3) which, with exceptions discussed below, sets out the conditions under which a mezzanine can be exempted from being a storey. Among the requirements imposed is that a mezzanine cannot exceed 40 percent of the area of the room in

which it is located. As noted before, since the proposed addition is designed as a teaching studio and not a regular theatre, the instructional spaces are fully sized but the audience space is considerably reduced. This situation allots a far larger percentage, exceeding 40 percent, of raised areas in comparison with the room size. The grid, catwalk and control room levels therefore do not conform with this condition necessary in order to enable them to be considered mezzanines under Sentence (3).

Sentence 3.2.1.1.(4) is an exception to Sentence (3). It provides an alternative exemption from designating a raised level as a storey. Sentence (4), with the exception of Sentence (5), allows a mezzanine not to be considered as a storey if the total area of the raised level does not exceed ten percent (in this case Clause (b) is applicable) of the storey in which it is located. The aggregate area of the three mezzanines, however, also exceeds 10 percent of the storey (of the new addition).

Nevertheless, Sentence 3.2.1.1.(5), as an exception to Sentence (4), is relevant in the present instance. It requires, with an exception not applicable here, that if one mezzanine level is located above another, then the upper level must be considered as a storey. As described in the previous section, the catwalk in the studio is wholly situated on top of control booth level. Consequently, even if the mezzanine areas were of a size that compliance with Sentences (3) or (4) were possible, due to Sentence (5), the studio would have to be considered as a two storey space. As a result, Sentence (6) of Article 3.2.1.1. is germane. It states that a mezzanine that is considered as a storey must meet the fire separation requirements of Articles 3.2.2.20. to 3.2.2.83. For the subject addition, the appropriate Article is 3.2.2.24.

Article 3.2.2.24. sets out building size and construction relative to occupancy. In this instance, the subject addition must, in terms of construction standards, provide floor assemblies, mezzanines and load bearing members with a fire resistance rating of one hour. As proposed, the various upper levels of the studio will not provide a one hour rating.

Sentence 3.2.8.2.(1) provides a specific set of exemptions to the special protection, especially in terms of fire safety, often required for a mezzanine. Among the conditions set out that offer exemption is that the mezzanine serve an A1 major occupancy, which is the classification given to most legitimate theatres. As indicated prior, the addition however, as an instructional space, is classified as an A2 occupancy.

Article 3.4.2.2. deals with exiting from a mezzanine. It states that the exit facilities for a mezzanine shall be the same as those for a floor area unless specifically exempted in Sentences (2) to (4). Again, the proposed mezzanines do not qualify for the exceptions provided. This means that the grid iron, having a proposed travel distance of approximately 60 m from its most remote area, must be provided with an additional exit in order to comply with the exiting requirement of 45 m found in Clause 3.4.2.5.(1)(c).

It is alleged therefore that the construction as proposed does not meet Code requirements in certain areas described above. To address these apparent deficiencies, the Applicants are proposing certain compensating measures. According to the Applicant, this compensating construction includes the installation of a smoke-activated visual alarm system and a smoke hatch over the grid iron area. The Applicant is also proposing to "develop and post a fire safety plan, and ensure that all instructors and other users of the facility are knowledgeable of it."

The issue at dispute then is whether the proposed construction, in conjunction with the intended compensating measures achieves a level of safety in the studio so as to sufficiently comply with the aforementioned requirements of the Ontario Building Code.

4. Provisions of the Ontario Building Code

Sentences 3.2.1.1.(3) to (6) Exceptions in Determining Building Height

(3) Except as required in Sentence (4), (5) & (8), a mezzanine shall not be considered as a storey in calculating the building height provided

(a) the aggregate area of the mezzanine floor is not more than 40% of the area of the room or storey in which it is located,

(b) it is used as an open floor area except as permitted by Sentence 3.3.2.11.(3), and

(c) the space above the mezzanine floor has no visual obstructions more than 1 070 mm (3 ft 6 in) above the floor.

(See Appendix A).

(4) Except as required by Sentence (5), a mezzanine shall not be considered as a storey in calculating building height and need not conform to Sentence (3) provided the aggregate area of the mezzanine floor is not more than 10% of the area of the

(a) the suite in which it is located, where there is more than one suite in the storey, or

(b) the storey in which it is located, in all other cases.

(See A-3.2.1.1.(3) in Appendix A).

(5) Except as permitted by Sentence (8), if one or more levels of mezzanine is partially or wholly superimposed above another mezzanine in the room or storey, each level additional to the first level shall be considered as a storey in calculating the building height.

(6) The floor assembly of a mezzanine that is required to be considered as a storey in determining building height, shall be constructed in conformance with the fire separation requirements of Articles 3.2.2.20 to 3.2.2.83, for floor assemblies.

Article 3.2.2.24. Group A, Division 2, up to 6 Storeys, Any Area, Sprinklered

(1) A building classified as Group A, Division 2, that is not limited by building area, is permitted to conform to Sentence (2) provided

(a) except as permitted by Sentence 3.2.2.7.(1), the building is sprinklered, and

(b) it is not more than 6 storeys in building height.

(2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and

(a) floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h,

(b) mezzanines shall have a fire-resistance rating not less than 1 hr, and

(c) all load-bearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

Sentence 3.2.8.2. Exceptions to Special Protection

(1) A mezzanine need not terminate at a vertical fire separation nor be protected in conformance with the requirements of Article 3.2.8.3. to 3.2.8.11. provided the mezzanine

(a) serves a Group A, Division 1 major occupancy,

(b) serves a Group A, Division 3 major occupancy in a building not more than 2 storeys in building height, or

(c) is not considered as a storey in Sentences 3.2.1.1.(3) or 3.2.1.1.(5) in calculating building height provided
  (i) every point on the mezzanine is within 25 m (82 ft) of a point or points on the mezzanine perimeter from which, in the aggregate, an occupant may view 60% of the area of the room or storey in which the mezzanine is located, and
  (ii) the mezzanine does not contain a Group B occupancy,
(d) is not considered a storey in Sentence 3.2.1.1. (4) in calculating building height provided the mezzanine is not more than 500 m (5,380 m) in area and does not contain a Group B occupancy, or
(e) is not considered a storey in calculating building height in Sentence 3.2.1.1.(8).

Article 3.4.2.2 Mezzanine Exiting

(1) Except as permitted by Sentences (2), (3) or (4), a mezzanine shall be provided with exits on the same basis as required for floor areas by this Section.
(See Sentences 3.3.1.5.(2) and (3) for egress requirements.)

(2) A mezzanine need not conform to Sentence (1) provided Article 3.2.8.1. does not require it to terminate at a vertical fire separation.

(3) In a floor area that is not sprinklered, a mezzanine need not conform to Sentence (1) where Article 3.2.8.1. does require it to terminate at a vertical fire separation provided the total occupant load of the mezzanine is not more than 60 and,
(a) the area of the mezzanine does not exceed the area limits for rooms and suites in Table 3.3.1.5.A., and
(b) the distance limits in Table 3.3.1.5.A are not exceeded from any point on the mezzanine to
  (i) the egress doorway from the room in which the mezzanine is located if that room has a single egress doorway, or
  (ii) an egress facility leading from the mezzanine if the room in which the mezzanine is located has 2 egress doorways provided in conformance with Subsection 3.3.1.

(4) In a floor area that is sprinklered, a mezzanine need not conform to Sentence (1) where Article 3.2.8.1. does require it to terminate at a vertical fire separation provided the total occupant load of the mezzanine is not more than 60 and,
(a) the area of the mezzanine does not exceed the area limits for rooms and suites in Table 3.3.1.5.B, and
(b) the distance of travel is not more than 25 m (82 ft) when measured from any point on the mezzanine to
  (i) the egress doorway from the room in which the mezzanine is located if that room has a single egress doorway, or
  (ii) an egress facility leading from the mezzanine if the room in which the mezzanine is located has 2 egress doorways provided in conformance with Subsection 3.3.1.

Clause 3.4.2.5.(1)(c) Location of Exits

(1) Except as permitted by Sentences (2), (3) and 3.3.2.4.(6), if more than one exit is required from a floor area, the exits shall be located so that the travel distance to at least one exit shall be not more than...

(c) 45 m (147 ft 8 in) in a floor area that contains an occupancy other than a high hazard industrial occupancy, provided it is sprinklered.

5. Applicant's Position

The Agent for the Applicant began their presentation with a brief description of the project. As an instructional facility, it is a mini theatre, she stated, but because it has a low number of seats, the proportion of the mezzanine area in comparison with the remainder of the room is well over 40 percent. However, in order to serve its purpose, the studio must be constructed as such. Fanshawe College, she noted, trains theatre technicians, not actors.

The Agent then described the proposed multiple mezzanines in the studio space and how they are to function. The three levels must operate with coordination from each other and from the stage below. As a result, they need to be as open as possible. The grid, in particular, since it sits directly above the stage, must have an open floor system with its line well slots. Without being constructed in this manner, it would be impossible to perform its intended function. This openness, the Agent added, also makes the mezzanines, especially the grid, quite safe. Fire and/or other emergencies will be detected almost instantly, giving persons on the grid ample time to react appropriately, she argued.

A theatre safety consultant, appearing on behalf of the Applicant, also provided explanation as to how the three levels of the facility are to operate. He elaborated on the argument that the facility had to be designed in this manner or it would render the training of theatre technicians meaningless. He added that it enhances the future safety of all theatres and the individual safety for the in-training students if they learn in a real life situation so they are well prepared for the facilities in which they will eventually work. The consultant also noted that many similar multi mezzanine facilities have been built, most being in legitimate theatres and some found in post-secondary performance centres.

Also contributing to the safety of the mezzanines will be their low occupant load, the Agent explained. She indicated that a maximum of 15 to 16 persons, including instructors, would be on the various mezzanine levels during classes. The students will be of relatively mature age, being at least 18 years old or more. As well, while on the mezzanines, they will be supervised. On the grid there would be as few as four persons when setting up a show and no one would be on the grid during a show, the Agent noted. In addition, the total occupant load for the studio when a performance is taking place would be approximately 75 persons, including students and instructors. During such times, the audience will be prevented from gaining access to the mezzanines since the stairs will be gated at the ground floor level.

The Agent acknowledged that much of the issue at hand dealt with fire safety and as a consequence had to be taken as a "matter of utmost importance". In this regard, she argued that the studio and the addition as a whole will be quite safe. For example, the building, including the addition, are noncombustible construction and the studio itself is to be separated from the remainder of the building by a one hour rated wall. The building is also equipped with full sprinkler and fire alarm systems, she noted. Moreover, as compensatory measures, the studio portion of the alarm system will be equipped with a smoke-activated visual (strobe) alarm. In addition, the smoke management system in the studio will include a smoke hatch above the grid iron area and a fire safety plan will be developed with training provided for faculty and students, etc.

During the hearing the Agent offered to improve upon the compensating measures already provided in three ways. First, the proposed spiral stairs at the southeast corner will be replaced with a Code

compliant set of egress stairs. Secondly, the Agent offered to ensure that all proposed guards would be modified to comply with OBC requirements except in the loading gallery area where the guard design would be changed to include a single upper horizontal rail and a mid-level horizontal rail. Thirdly, she also offered to improve the safety of the loading gallery area by affixing a series of horizontal metal rods, 203 mm (8 in) on centre which span between the floor of the loading gallery area and the wall opposite.

With respect to the issue of travel distance, the Agent indicated that it had been resolved with the Respondent. The travel distance will now meet the 45 m requirement set out in Clause 3.4.2.5.(1)(c).

The Agent also argued that the stage and mezzanine areas, as designed, are recognized by Code. In fact, if they were to simply create additional seating capacity in the audience area of the facility compliance would be achieved. However, adding seats would in no way improve the physical safety of the building. Adding seats is an unnecessary expense, the Agent argued. And building a large theatre in St. Thomas, with a population of approximately 30,000 people, does not make economic sense.

Finally, the agent argued that the BCC could choose to consider the mezzanines as working areas or platforms which may allow for some exemptions or relaxations under the Building Code. She indicated that a precedent has already been created in this regard. The Mississauga Living Arts Centre successfully established that is its grid area can be considered as a working platform.

6. Respondent's Position

The Respondent submitted that he does not object to the proposal, however, he indicated that he does not have the authority to approve it. The Code is clear on the matter of the mezzanines and their determination as floor levels, he argued.

Regarding the proposed compensating measures, the Respondent noted that while they would improve the level of safety in the building, the building code does not specifically recognize such alternative methods of compliance. As a result, he stated that the municipality must abide by its responsibility to enforce the prescriptive standards in the Code.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed mezzanine, the upper mezzanine and grid iron areas intended as part of a live performance teaching facility, in conjunction with the additional protective measures offered, provide sufficiency of compliance with Sentences 3.2.1.1.(3),(4) and (5), Article 3.2.2.24., Sentence 3.2.8.2.(1), Article 3.4.2.2. and Clause 3.4.2.5.(1)(c) of the Ontario Building Code at the Fanshawe College "Live Performance Industry" Facility, St. Thomas/Elgin Campus, 120 Bill Martyn Parkway, St. Thomas, Ontario on condition that:

a) All stairs and guards must conform to the OBC, except in the loading gallery area where the guard is to be modified to include a single upper horizontal handrail and a single centre horizontal rail; and,

b) Installed at the edge of the loading gallery area will be a series of horizontal metal bars at 203 mm (8 in) on centres that span perpendicular from floor level of the loading gallery to the opposite wall.

8. Reasons

i) The proposed addition includes a training facility equipped with all the characteristics and elements for live theatre performances, but which is not contained within a legitimate theatre. As a result, in the Commission's view, it will not function as a typical A2 occupancy.

ii) The occupant load on the mezzanines and grid iron areas, at less than 20 students, will be limited. Students will be supervised when on these areas.

iii) The stair to the mezzanines and grid iron areas is to be gated for limited control and access.

iv) With the above condition "a" fulfilled, the proposed stairs and guards will satisfy OBC requirements.

v) The proposed travel distances comply with OBC requirements.

vi) The facility will also be provided with a fire alarm system.

vii) Smoke control will be provided in the theatre facility.

viii) The smoke alarm system will be equipped with a highly visual strobe alarm light.

ix) A fire safety plan approved by the municipal fire department will be developed and all persons to occupy the mezzanine and grid iron areas will receive such training prior to use.

BCC Ruling No. 01-03-796

BUILDING CODE COMMISSION DECISION ON B.C.C. #. 01-03-796

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Section 9.23. and Part 11 of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Thomas Lehan, Homeowner, St. Catharines, Ontario, for the resolution of a dispute with Mr. John Fisher, Chief Building Official, City of St. Catharines, Ontario, to determine whether the various identified alleged deficiencies provide sufficiency of compliance with the relevant provisions of the Ontario Building Code at the Lehan Residence, 1164 Pelham Road, St. Catharines, Ontario.

APPLICANT
Mr. Thomas Lehan
Homeowner
St. Catharines, Ontario

RESPONDENT
Mr. John Fisher
Chief Building Official
City of St. Catharines

PANEL
Dr. Kenneth Peaker, Chair
Mr. John Guthrie
Mr. Fred Barkhouse

PLACE
Toronto, Ontario

DATE OF HEARING
February 8th, 2001

DATE OF RULING
February 8th, 2001

APPEARANCES
Mr. Thomas Lehan
Homeowner
St. Catharines. Ontario

The Applicant

RULING

1. The Applicant

Mr. Thomas Lehan, Homeowner, St. Catharines, Ontario, has received an order under the Building Code Act, 1992 to remedy certain alleged deficiencies at the Lehan Residence, 1164 Pelham Road, St. Catharines, Ontario.

2. Description of Construction

The construction in dispute was not described at the hearing.

3. Dispute

The issue at dispute between the Applicant and Respondent, as stated by the Applicant, is whether the various identified alleged deficiencies provide sufficiency of compliance with the relevant provisions of the Ontario Building Code at the Lehan Residence, 1164 Pelham Road, St. Catharines, Ontario. The Respondent, on the other hand, claims there is no dispute.

4. Provisions of the Ontario Building Code

Section 9.23. Wood-Frame Construction

Please refer to the Ontario Building Code.

Part 11 Renovation

Please refer to the Ontario Building Code.

5. Applicant's Position

At the hearing, the Applicant stated that it was his belief that the BCC could make a determination regarding the compliance of the identified alleged deficiencies in terms of the technical requirements of the OBC. While he acknowledged that he had completed all of the work indicated on the order issued to him, he argued that the Commission should still rule on these matters. This was because, as he claimed, he was given erroneous information about his appeal rights to the BCC, specifically regarding the statute of limitations in which an appeal could occur. As the Applicant explained, he was instructed that he had only 20 days to appeal

his order to the Commission. He later discovered this 20 day limit does not apply to the BCC.

In summation, the Applicant stated that the BCC was the most appropriate body in Ontario to hear matters regarding the technical compliance with the OBC. Since his issues deal with conformance to the technical requirements of the Code, the BCC should therefore make decisions on the matters at hand.

6. Respondent's Position

The Respondent did not attend the hearing. The Commission therefore relied on his written submission only.

The Respondent submitted that since all of the various items in the work order had been complied with, they no longer had a dispute with the Applicant.

7. Commission Ruling

It is the decision of the Building Code Commission that as there is no longer a dispute between the Applicant and Respondent, the Commission cannot make a determination in this matter. To do so, in our opinion, would be beyond the mandate of the BCC.

8. Reasons

i. The mandate of the BCC is found is Section 24 of the Building Code Act. This Section authorizes the BCC to hold hearings regarding technical matters of the Ontario Building Code that involve ***disputes*** (our emphasis) between applicants and respondents as they are defined in Section 24. As this Section indicates, a dispute must be present between the defined parties for the Commission to have jurisdiction. Indeed, for adjudicative tribunals, hearing disputes between parties is the purpose of their existence.

ii. By fulfilling all of the items of the work order issued against him to the satisfaction of the municipality, the Applicant no longer qualifies, as Subsection 24(1) states, as "someone to whom an order has been given." Moreover, to our knowledge, he does not match the other criteria that makes one eligible as an applicant to the BCC either.

Agent for the Applicant

Mr. Kwan Lo
Manager, Permit Services
Oshawa, Ontario
Designate for the Respondent

RULING

1. The Applicant

Mr. Thomas Phelan, Construction Manager, The Home Depot, Scarborough, Ontario, has applied for a building permit under the Building Code Act, 1992 to construct a seasonal-use shade screen within an outdoor garden centre at the Home Depot, 1481 Harmony Road North, Oshawa, Ontario.

2. Description of Construction

The Applicant is proposing to construct a new shade screen to be used for the sale and display of plant material and agricultural products. The shade screen is to be located within an outdoor garden centre that abuts an existing Home Depot building. The structure is described as L-shaped, unheated, one storey in building height and 613 m^2 in building area. It consists of a concrete slab floor and a polyethylene fabric roof supported by a steel frame structure. The fabric has a flamespread rating of 25 based on tests conducted in accordance with CAN/ULC-S109. The roof must be removed in the winter because it is not designed to sustain snow

loading.

The shade screen will be positioned such that its length abuts the Home Depot store. A 150 mm (6 in) gap will separate the shade screen from the existing building. The other three sides of the shade screen are to be open. (The ends of the shade screen will not have gables.) The open sides will have at least 3 m horizontal distance to adjacent buildings and property lines. The south end of the shade screen will be enclosed with a high security chain link fence. Beyond the shade screen, the remainder of the garden centre will be used for the open air display of other products, such as landscaping materials.

The existing Home Depot store is described as a one storey, Group E - mercantile occupancy with a building area of 10,754 m^2. The building is noncombustible construction, with the exterior walls made of precast concrete having a two hour fire resistance rating. The store is equipped with electrically supervised sprinkler and fire alarm systems. There are also fire hydrants located adjacent to the existing store and the proposed location for the shade screen. The building is considered to face two streets for fire fighting purposes.

The proposed exiting arrangement between the two structures will allow occupants from the store to discharge through two exits into the shade screen area. This will account, however, for no more than 25% of the store's total required exit capacity. The two exit doors will be equipped with close spaced sprinklers. As well, window sprinklers are to be installed on one side of the glazing over the doors. At least two means of egress will be provided for the shade screen area, one of these will be through two doors in the chain link fence which form part of the means of egress. The egress aisles through the garden centre, including the shade screen, will be at least 1.1 m wide.

3. Dispute

The primary issue at dispute between the Applicant and Respondent is whether the shade screen, due to its proposed construction and seasonal use, can be viewed as a structure that may be permitted to conform to the construction standards of Section 3.13. Tents and Air Supported Structures. This Section sets out provisions that govern the use and construction of certain structures, specifically tents and air-supported structures.

If the shade screen does not meet the test of a structure as currently set out in OBC 3.13., then it must be deemed a building under the Code. (The shade screen was not presented by the Applicant as an Article 3.2.2.2. Special and Unusual Structure.) If so, among the provisions of the Ontario Building Code it would be required to comply with would include, but not be limited to, Sections 3.2. Building Fire Safety, 3.3. Safety Within Floor Areas and 3.4. Requirements for Exits.

In the determination of this question, it should be noted that in earlier versions of the Code this Section (known as Subsection 3.1.6. Tents, Air-Supported Structures and Temporary Structures

in the 1990 OBC) contained provisions for the construction of temporary structures. This Commission in the past found other similar seasonal-use structures to have sufficiency of compliance with Subsection 3.1.6. with certain conditions (e.g., BCC Ruling 98-11-616). Since that time, Subsection 3.1.6. was amended as one of the revisions to the 1997 version of the OBC. The amendment to Subsection 3.1.6. deleted the entire category of structures described as temporary. The current OBC therefore has no provisions governing such construction.

In pursuing its mandate of determining interpretation or sufficiency of compliance issues regarding the technical requirements of the OBC, the BCC must look to the version of the Code current at the time the permit was applied for or issued or when the order was made. In the case of the subject shade screen, the 1997 OBC is the relevant edition.

The second issue is whether the shade screen, which is to be located approximately 150 mm away from an existing exterior wall, is to be considered as an addition onto the existing store or as a separate structure. This question depends, in part, on the answer to the first issue. If it is deemed not to be a Section 3.13.-type structure, then, as a building, the spatial separation requirements of Subsection 3.2.3. Spatial Separation and Exposure Protection would apply. However, if the shade screen is permitted to conform to OBC 3.13. then the spatial separations would be dictated by provisions in that Section.

If this is the case, regardless of whether the structure is considered a tent or an air-supported structure, the required horizontal separations, if deemed to be a separate structure, are the same - both at 3 m. On the other hand, if the shade screen is viewed as an addition, the requirements for tents and air-supported structures differ. Article 3.13.1.4. (which would be applicable because the shade screen is larger than 225 m^2) does not permit a tent occupied by the public to be constructed as an addition to a building. In contrast, Article 3.13.2.3. permits an air-supported structure to be attached to another building, but under certain conditions.

4. Provisions of the Ontario Building Code

Article 3.2.2.2. Special and Unusual Structures

1. A structure which cannot be identified with the characteristics of a *building* in Articles 3.2.2.20. to 3.2.2.83. shall be protected against fire spread and collapse in conformance with good fire protection engineering practice. (See A-3, A-3.2.2.2.(1) and A-3.2.5.13.(1) in Appendix A.)

Sentence 3.2.3.7. (2) Construction of Exposing Building Face

2. Except as permitted by Sentence (9) and Articles 3.2.3.9. and 3.2.3.10., if a *limiting distance* shown in Table 3.2.3.1.A. or Table 3.2.3.1.C. for a Group A, B, C, D or Group F, Division 3 to have *unprotected openings* more than 10% but not more than 25% of the *exposing building face* , the *exposing building face* shall
    a. have a *fire-resistance rating* not less than 1 h, and
    b. be clad with *noncombustible* cladding.

Subsection 3.13.1. Tents (Selected Articles)

Article 3.13.1.1. Application

1. Except as provided in this Subsection, tents are exempted from complying with the requirements of this Code.

Article 3.13.1.2. General

1. Except as provided in Sentence (2), the requirements of this Subsection shall apply to all tents.
2. Articles 3.13.1.4., 3.13.1.5., 3.13.1.6. and 3.13.1.10. apply to tents that

(a) do not exceed 225 m^2 (2,420 ft^2) in ground area,
(b) do not exceed 225 m^2 (2,420 ft^2) in aggregate ground area and are closer than 3 m (9 ft 10 in) apart,
(c) do not contain bleachers, and
(d) are not enclosed with sidewalls.

Article 3.13.1.3. Means of Egress

1. Except as provided in Sentences (2) and (3), tents shall conform to Sections 3.3. and 3.4.
2. A tent need not conform to Article 3.4.6.11. except where swing type doors are provided.
3. Where the area between adjacent tents or a tent and the property line is used as a *means of earess*. the minimum width between stake lines shall be the width necessarv for

means of egress, but not less than 3 m (9 ft 10 in).

Article 3.13.1.4 Clearance to Other Structures

1. Tents shall not be erected closer than 3 m (9 ft 10 in) to the property line.

2. Except as provided in Sentences (3), (4) and (5), tents shall not be erected closer than 3 m (9 ft 10 in) to other tents or structures on the same property.

3. A *walkway* between a *building* and a tent occupied by the public is permitted provided,

   (a) the tent is not closer than 3 m (9 ft 10 in) from the *building*, and

   (b) the *walkway* conforms to Article 3.2.3.18.

4. Tents not occupied by the public need not be separated from one another, and are permitted to be erected less than 3 m (9 ft 10 in) from other structures on the same property, where such closer spacing does not create a hazard to the public.

5. Tents located on fair grounds or similar open spaces, need not be separated from one another provided such closer

Subsection 3.13.2. Air-Supported Structures (Selected Articles)

Article 3.13.2.1. Application

(1) Except as provided in this Subsection, the requirements of the Code apply to *air-supported structures*.

Article 3.13.2.2. General

6. *Air-supported structures* shall not be used for Groups B, C, or Group F, Division 1 *major occupancies* or for classrooms.

7. Except where no *fire separation* is required between *major occupancies*, *air-supported structures* shall contain not more than one *major occupancy*.
8. Except as provided in Sentence (5), *air-supported structures* are exempt from complying with Articles 3.2.2.20. to 3.2.2.83., except for maximum *building* size.
9. *Air-supported structures* may be designed with interior walls, *mezzanines*, or similar *construction*.
10. Interior construction contained within *air-supported structures* must meet the construction requirements of Articles 3.2.2.20. to 3.2.2.83.

Article 3.13.2.3. Spatial Separation

11. Except as provided in Sentences (2), (3) and (4), *air-supported structures* shall not be erected closer than 3 m (9 ft 10 in) to other structures on the same property or to the property line.
12. *Air-supported structures* not occupied by the public need not be separated from one another, and are permitted to be erected closer than 3 m (9 ft 10 in) from other structures on the same property where such closer spacing does not create a hazard to the *building* occupants or the public.
13. Except as provided in Sentence (4), an *air-supported structure* is permitted to be attached to another *building* provided the *building* to which it is attached
    a. conforms to the requirements of other Parts of the Code based on the total *building areas* of the *air-supported structure* and the attached *building*,
    b. is *sprinklered*, and
    c. is separated from the *air-supported structure* by a *fire separation* having a *fire-resistance rating* of not less than 1 h.

5. Applicant's Position

The arguments made by the Agent for the Applicant did not specifically address the first issue regarding whether the provisions of Section 3.13. are applicable to the proposed shade screen. He focussed his discussion instead on proving why the shade is not a conventional building and thus should not be subject to the construction requirements of

Sections 3.2. to 3.4. To this end he submitted that the shade screen, while fitting the definition of a building found in the Building Code Act since it comprises a roof sheltering an occupancy below, does not have a floor area nor a building area as defined in the OBC because there are no exterior walls. As such, the Agent asserted that to apply the full requirements for a conventional building found in the Code to subject structure would not only be problematic, but also onerous. Further, he noted that in the past the Commission approved numerous such structures.

The Agent also elaborated on, as he argued, the inherent safety of the shade screen. He noted that three sides were completely open and provided access to an approved open space refuge area. The roof fabric itself, with a low flame spread rating of 25, meets the CAN/ULC-S109 standard. Moreover, the only material stored under the screen will be plants and plant material and not lumber, etc.

Another argument developed by the Agent was that as a seasonal-use facility, the construction of the structure is not intended to be similar to that of a conventional building. The sole purpose of the shade screen, he noted, was to protect plants from the sun and people from the rain. It is not designed to do more or perform other functions. It is the incongruity between the simple purpose of the shade screen, as proposed, and the standards of a full fledged building that may be at the centre of the subject dispute, the Agent suggested.

Regarding the issue of whether the shade screen is an addition or a separate structure, the Agent indicated that in his view it is clearly a separate and distinct structure. Whereas this would normally mean that Subsection 3.2.3. is applicable to both buildings, he argued however, in the present instance it does not apply to the shade screen, only to the existing store. As he explained, "(b)y the definition of "exposing building face" in Subsection 3.2.3., since there is no exterior wall, Subsection 3.2.3. is not applicable."

The Agent further expanded on his position by stating:

"In order to separate (the) buildings, it is our opinion that the Home Depot store must meet the provisions of the OBC for a building facing an imaginary line which has a 0 m limiting distance for spatial separation purposes. Under Clause 3.2.3.7.(2)(a), this requires the exterior wall of the Group E occupancy adjacent to the shade screen to have a 2 h fire-resistance rating, only (not a fire separation), be of noncombustible construction, and have noncombustible cladding."

As he continued:

"The OBC allows two buildings to be created on one property. The requirements of Subsection 3.2.3. for spatial separation are applicable to the Home Depot store which is achieved by the provision of the 2 h fire-rated exterior wall which is of noncombustible construction with noncombustible cladding and has protected openings. The provisions of Subsection 3.2.3. are not applicable to the shade screen since there are no exterior

walls and therefore, no exposing building face."

With respect to the exiting arrangement between the two structures, the Agent argued that the Home Depot store is permitted to egress through the shade screen, but this will be limited to 25 percent of the store's total required exiting capacity. And since these are two separate structures, the travel distance may be measured from the exterior wall of the Home Depot building. As well, the Agent is proposing to protect the two exit doors from the store leading into the shade screen with close space exposure sprinklers on the Home Depot side of the doors. The glazing above these doors is also to be protected from store side with a window sprinkler assembly. These measures, he asserted, will provide a safe interface between these structures at the exit doors.

Lastly, the Agent also offered to add more pull stations at the exit doors and the paint lines in the garden centre area, including the shade screen, to better articulate the required location and width of the aisles.

In summation, the Agent stated that it was his opinion that their above interpretation of the OBC is consistent with the life safety and fire protection requirements of that document.

6. Respondent's Position

The Respondent submitted that his primary difficulty with the proposal is that he cannot classify it under the OBC and therefore is unable to determine appropriate construction requirements. His position therefore on the first issue was that the shade screen is a structure that is subject to neither the requirements of Section 3.13, nor can it be classified under Articles 3.2.2.20. to 3.2.2.83. or any other provisions in the OBC for that matter.

The Respondent then explained that while he acknowledges the Agent's arguments regarding the seasonal use of the facility, he is nonetheless concerned because during the months the shade screen and garden centre are in operation the occupant load of those areas will likely be just as high per m^2 as the existing store.

The Respondent stated that prior to appeal being made to the BCC he had offered his own suggestions to the Applicant to achieve equivalency. One of the proposals he put forward included a combination of: maintaining the roof with the flame spread rating of 25 and the store's 2 h noncombustible wall, but limit the openings and protect them as if they were in a firewall; excluding the required exit capacity of the main building that leads into the garden centre; providing sufficient exits from the garden centre and prohibiting storage of any combustible material at any time of year in the shade screen.

unless a dry-type sprinkler system is installed. This proposal failed because the Applicant, he explained, could not accept discounting the two store exits from discharging into the garden centre.

As an alternative, the Respondent indicated that he also suggested that a 4 h rated wall conforming to OBC Subsection 3.1.10. be provided between the two structures. This proposal also was not favoured by the Applicant.

The Respondent did not pose specific arguments addressing the second issue.

In conclusion, the Respondent stated that he knows that many of these buildings exist in Ontario. But, in his view, their construction was not supported by the Building Code. He indicated that the Code is either not clear on regulating such structures or simply does not address them. Either way, he hoped that the BCC hearing might provide clarity on the current OBC or lead to a possible Code amendment. He also indicated that he would have accepted the previous BCC rulings as a guide to approve the subject structure, but since the Commission cannot, in a strictly legal sense, set precedent he felt he could not rely on earlier decisions. Moreover, since the Code was amended to remove the provisions regarding temporary structures, he was unsure if those BCC decisions could even be used as de facto precedent.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed shade screen cannot be permitted to conform to the construction standards of Section 3.13. Tents and Air Supported Structures. We hold that the shade screen is not a tent in that it is intended to be a permanent, seasonally used structure. It cannot be regarded as an air-supported structure either. As such, the Commission views the shade screen as a building and since no exceptions are allowed in the Code for such a facility, the requirements of Sections such as 3.2. to 3.4. are applicable. The Commission notes that notwithstanding that these structures have been erected throughout the Province, no special standards exist within the OBC to govern such seasonal-use, permanent buildings.

Having determined that the structure is a building, the Commission notes that it fails to comply with applicable Code requirements. The following are among some of the deficiencies: The building is not sprinklered in accordance with Article 3.2.2.62., the provision determining the construction requirements of buildings of this size and occupancy. Also, the roof covering does not comply with Subsection 3.1.15., which requires the roof to be classified in accordance with CAN/ULC-S-107-M.

On the secondary issue, it is the decision of the Building Code Commission that the shade screen, which is to be located approximately 150 mm away from an existing exterior wall, is considered as a separate building, and as a result must meet the spatial

separation requirements of Subsection 3.2.3. This is in addition to the existing building also being required to meet the spatial separation standards.

8. Reasons

n. While the roof is to be removed in the winter, the construction of the shade screen is permanent. The Commission considers even the use of the facility to be permanent, albeit on a seasonal basis. This permanence precludes the shade screen from meeting the definition of a tent, which the Code clearly requires to be temporary.
o. The shade screen does not meet the definition of an air-supported structure since it is not supported by air. The roof is held up by steel trusses and other structural framing.
p. The shade screen is separated from the home depot building by a 150 mm gap. It is not attached as an addition must be.

Dated at Toronto this **11th** day in the month of **January** in the year **2001** for application number **2000-80**.

DATE OF HEARING	January 11, 2001
DATE OF RULING	January 11, 2001
APPEARANCES	Mr. George Nichols, Architect George Nichols Architect Inc. Kanata, Ontario **Agent for the Applicant** Mr. Frank Bell / Luc Nadeau Part 3 Plan Examiners City of Ottawa **Designates for the Respondent**

RULING

1. The Applicant

Dr. G. Sauve, Board of Directors, Lycee Claudel (Private School), Ottawa, Ontario, has received a building permit under the Building Code Act, 1992 and has expanded an existing school complex at Lycee Claudel, 1635 Riverside Drive, Ottawa, Ontario.

2. Description of Construction

The Applicant has expanded an existing school facility, built in 1960, by adding a new one storey multipurpose room to the rear of its gymnasium. The entire complex including the new addition has a Group A, Division 2 - Assembly occupancy. The building is of noncombustible construction, and is equipped with a fire alarm system but not a sprinkler system. The existing complex is 3,075 m^2 in building area. The new addition occupies an area of 499 m^2.

The existing portions of the school complex, referred to as blocks A, B, and C, are located around a rectangular open air podium. Blocks A and B border the podium at its north and south sides, respectively. The east side of the podium is flanked by block C (the gymnasium). The new portion, referred to as block D, has been added to the east side of block C (or the gymnasium).

While the three parts of the building appear above grade to be separate structures, they are in fact considered to be one building since they are connected by below grade corridors located underneath the open air podium. This below grade link contains pedestrian corridors, student locker rooms, showers, washrooms and a storage room. The adjacent blocks (A, B, and C) are separated from the link by a fire separation having a fire resistance rating of 45 minutes. As currently built and used, the link does not comply with an underground walkway as envisaged in Article 3.2.3.19. and therefore cannot be considered as a facility to separate two or more buildings.

The addition is accessible through block C and a new above grade covered walkway constructed along the south side of block C. This walkway terminates at the main entrance to block D and is connected to the podium through a stairway located at the south-east corner between blocks B and C.

The construction in dispute involves the location of the existing fire hydrant which is proposed to serve the fire fighting needs of the new addition.

As part of the construction, the Applicant is proposing to construct a firewall at the western exposing building face of block C where it abuts the podium. In so doing, the Applicant is creating a separate building comprised of blocks C and the addition onto to it; block D. This structure, with a smaller building area of only 1,219 m^2, will be subject to less stringent OBC requirements.

As a distinct building, blocks C and D are required to face a street or an access route. The Applicant is proposing that the existing access route to the south of the building be considered as the access route serving the new building.

There are two fire hydrants currently on the property. One is located in the extreme north-west corner of the lot to serve a separate administration building. The second hydrant, subject to the dispute at hand, is located directly opposite the open air podium and is approximately 45 m (via the podium) from the main entrance of the gymnasium - block C. The Applicant intends to use this

existing fire hydrant in order to provide water for fire fighting for the gymnasium and its extension (the multipurpose room).

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the location of the existing hydrant proposed to serve the needs of the expanded school facility provides sufficiency of compliance with Clauses 3.2.5.5.(2)(b) and (c) of the OBC.

According to Clause 3.2.5.5.(2)(b), for a building not provided with a fire department connection, the total travel distance from a fire hydrant to the building must not exceed 90 metres. The distance described in this provision is comprised of two components; the length from the hydrant to the vehicle and the length from the vehicle to the building. This latter distance is specifically addressed in Clause 3.2.5.5.(2)(c) which states that the path of travel from the pumper vehicle to the building must be unobstructed and not exceed 45 metres.

The travel distance from the fire hydrant opposite the open air podium as measured south on Riverside Drive to the existing fire access route south of block B and northward on the east side of block B to blocks C and D clearly exceeds the 90 m threshold. Exact figures were not supplied by the parties, but it is estimated to be at least 140 m. As a result, the Applicant is proposing that the path of travel envisaged in Clause 3.2.5.5.(2)(b) be measured from the subject hydrant across the podium to the stairs between blocks B and C and along the southern face of blocks C and D. He asserts that this distance, at 88 to 90 m, is within the allowable limit. As noted, the distance between this hydrant and the principle entrance of blocks C and D is 45 m.

At issue then is whether the path of travel from the existing fire hydrant via the podium to blocks C and D can be deemed as an unobstructed path of travel for fire fighting purposes.

4. Provisions of the Ontario Building Code

Clauses 3.2.5.5. Location of Access Routes

(2) Access routes shall be provided to a *building* so that

(b) for a *building* not provided with a fire department connection, a fire department pumper vehicle can be located so that the length of the access route from a hydrant to the vehicle plus the unobstructed path of travel for the fire fighter from the vehicle to the *building* is not more than 90 m (295 ft 3 in), and

(c) the unobstructed path of travel for the fire fighter from the vehicle to the *building* is not more than 45 m (147 ft 8 in).

5. Applicant's Position

The Agent for the Applicant began by submitting that the new addition of 499 m^2 attached to the existing gymnasium does not diminish the complex's current life safety situation. He noted that the new addition occupies only 16% of the total footprint. Also, the new addition is noncombustible construction and there is no increase in the occupant load due to this expansion. As a result, from a fire safety point of view, there is no reduction in the performance level of the building that would require the installation of another fire hydrant, he argued.

The Agent then stated that the distance between the existing fire hydrant and the principle entrance of block C (the gymnasium) is less than 45 metres. Furthermore, the total travel distance to block D is within the 90 metre limit. Based on this, he argued that they comply with OBC provision 3.2.5.5.(2)(b) and that the existing hydrant already provides the level of safety required. In fact, the location of the new hydrant, as proposed by the City, is farther away from blocks C and D than the existing one. He described the additional hydrant as redundant.

The only issue remaining, therefore, in his view is whether the open air podium is considered an obstruction to the required path of travel. On this point the Agent noted that the podium is a two hour horizontal fire separation and he stated that "running firehoses (sic) across it is no different than running (them) across an underground parking structure that extends out beyond a building footprint." He added that it may be possible to remove some of the perceived obstacles that may prevent access across the podium.

The Agent reiterated that he feels they already meet Code. He stated that the local fire department also thinks they meet the Code in a literal sense, but they thought it would be preferable from a fire fighting perspective that a third hydrant be installed.

In summation, the Agent added that while the City's position is admirable, they also have to balance cost issues. In his view, if they meet Code they do not feel it is justifiable to add another hydrant. Especially so when the proposed hydrant is questionable with respect to improving public safety. He concluded by stating that the City's position seems to be an exercise about striving for literal compliance with the Code.

6. Respondent's Position

The Respondent submitted that with the construction of the proposed firewall, blocks C and D would now be considered a separate building under the OBC and in accordance with Sentence 3.2.2.10.(1) must therefore either face a street or be provided with an access route conforming to Articles 3.2.5.5. and 3.2.5.6. In the plan review process, the Respondent noted, the Applicant indicated that they would provide an OBC compliant access route to the south of the complex and that a new hydrant would be installed on that access route. On this basis, a permit was issued. However, since then the Applicant has instead opted to rely on the existing fire hydrant, he explained.

Assuming no new hydrant will be installed, the Respondent stated that the Applicant basically has two choices regarding the existing hydrant. In terms of utilizing the access route south of the building, the Respondent described it as "nowhere close" to the disputed hydrant. As such, he indicated that the option of providing fire fighter access around the southern end of the school would far exceed the 90 m limit. The other option, measuring the path of travel from the hydrant to block C and D across the podium, is problematic. He argued that, in his view, the podium is obstructed since it contains certain fences and gates. The Respondent noted that, contrary to the Applicant's statement, the municipal fire department's inspector David Port found the podium approach route to be "not an acceptable solution".

As result, he argued that the city has no choice but to require that a new fire hydrant be installed at the southern access route within 90 metres of the building to ensure conformance with the Ontario Building Code.

7. Commission Ruling

It is the decision of the Building Code Commission that the location of the existing hydrant proposed to serve the needs of the expanded school facility does not provide sufficiency of compliance with Clauses 3.2.5.5.(2)(b) and (c) of Ontario Building Code at Lycee Claudel School, 1635 Riverside Drive, Ottawa, Ontario.

8. Reasons

i) The configuration of the podium with respect to the existing blocks and the new addition, in conjunction with the fences and lockable gates, create a proposed path of path of travel for fire fighting purposes that is indirect and has potential to be obstructed.

Dated at Toronto this **11 th,** day in the month of **January,** in the year **2001** for application number **2000-73.**

Mr. Len King, Vice-Chair

Mr. Michael Steele

Mr. Fred Barkhouse

Ontario

Ruling No. 00-61-793
Application No. 2000-81

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Article 3.1.8.1., Sentence 3.2.5.13.(1) and Articles 3.3.2.3., 3.3.2.4. and 3.4.3.4. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Jack Stelpstra, Operations Manager, Ellis-Don, London, Ontario, for the resolution of a dispute with Mr. Rocky Cerminara, Chief Building Official, City of London, Ontario, to determine whether the proposed main arena seating bowl, in particular the number of seats, row width, vomitory and aisle width, exits and access to exits and the smoke protection system, designed based on NFPA 101, 2000 "Life Safety Code" and NFPA 92B "Smoke Management Systems in Malls, Atria and Large Areas," provides sufficiency of compliance with Articles 3.3.2.3., 3.3.2.4., 3.4.3.4. and 3.1.8.1. and Sentence 3.2.5.13.(1) of the Ontario Building Code at the London Downtown Multipurpose Entertainment and Sports Centre, Dundas St. at Talbot St., London, Ontario.

APPLICANT	Mr. Jack Stelpstra, Operations Manager Ellis-Don London, Ontario
RESPONDENT	Mr. Rocky Cerminara Chief Building Official City of London
PANEL	Dr. Kenneth Peaker, Chair Mr. Michael Steele Mr. John Guthrie
PLACE	Toronto, Ontario
DATE OF HEARING	December 14th, 2000
DATE OF RULING	December 14th, 2000
APPEARANCES	Mr. Jonathan Rubes Leber/Rubes Inc. Toronto, Ontario **Agent for the Applicant**
	Mr. Rocky Cerminara Chief Building Official London, Ontario **The Respondent**

RULING

1. The Applicant

Mr. Jack Stelpstra, Operations Manager, Ellis-Don, London, Ontario, has applied for a building permit under the Building Code Act, 1992 to construct a multi-purpose sports and entertainment facility known as the London Downtown Sports and Entertainment Centre to be located on Dundas Street at Talbot Street in the City of London, Ontario.

2. Description of Construction

The Applicant is proposing the construction of an arena-type facility classified as having a Group A, Division 3 major occupancy. The building is considered as being two storeys in building height with the stories referred to as the ground or concourse level and the suites level. The building will also include a mezzanine known as the upper concourse level. (The three levels of the building - the two storeys and the mezzanine - correspond to the three levels found within the arena bowl; the lower bowl, the private suites and the upper bowl.) The structure will have a building area of 9,100 m^2 and is to be of noncombustible construction. It will be equipped with sprinkler, fire alarm and standpipe and hose systems. The building is to be constructed in accordance with Article 3.2.2.29. of the OBC.

The arena is proposed to have a total seating capacity of approximately 9,000 persons, with roughly 5,800 seats located on the lower bowl and suites levels and 3,200 intended for the upper bowl level. It is also anticipated that an additional 1,800 to 2,000 seats could be accommodated on the central ice surface or "event floor" for concert venues, etc.

The construction in dispute involves three main areas of the proposed arena. The first matter in dispute is the design of the fixed seating and the exiting configuration. It is proposed that the lower bowl contain 17 rows of seating with a maximum of 28 or 29 seats per row. The upper bowl will have the same number of seats per row, however, it will have fewer rows - only nine, except at the east end where there will be 12 rows. The maximum number of seats in lower bowl and upper bowl sections would be approximately 350 and 250 respectively. Each section of the arena is to be served by two vomitories, with those vomitories being shared between adjacent sections.

As designed, the proposal would permit narrower rows, more seats per row, narrower aisles and vomitories and less exit capacity and narrower exit width than prescribed by Code. The result would be an increase in time required to arrive at the exit points of the facility.

In conjunction with the proposed seating design and exit configuration, and offered in terms of providing an alternative method of conforming with OBC standards, the Applicant is intending to comply with the full requirements of NFPA 101-2000, "Life Safety Code", which can be employed to address indoor assembly fixed seating arenas such as the building in dispute. The principal features, as listed by the Applicant, included in this standard that are applicable to the design of the subject arena are as follows:

- emergency voice communication
- smoke-protection of the seating bowl and both concourses
- smoke-protection of exit stairs serving the seating bowl
- smoke-protection relative to escalator openings
- an engineered smoke control system
- fire protection of electrical conductors

- 2 hour emergency power for all life safety systems
- central alarm and control facility with active graphic annunciator and controls
- electrical supervision of smoke control system control and power wiring, by fire alarm system
- activation and control of smoke control equipment through fire alarm system (shutdown of normally operating HVAC systems via building automation system)
- smoke detection in concourses
- quick response sprinklers in all concourse concessions
- preparation of a Life Safety Evaluation per NFPA 101
- handrails in aisles in the upper bowl
- uniform treads in aisles
- increased guard heights at foot of aisles in the upper bowl

As indicated above, among the things required of NFPA 101 compliant buildings is that they be designed so that the seating areas and egress routes are smoke protected through the provision of a smoke control system. The smoke control and protection aspect of this proposal is to be achieved through compliance with another NFPA standard, in particular NFPA 92B, "Smoke Management Systems in Malls, Atria, and Large Areas".

The smoke control is to be performed, not by a dedicated smoke management system, but instead by a facility combined with the proposed HVAC system for the building. In order to assist the performance of the smoke control system, smoke detectors are to be provide throughout the upper and lower concourse levels, including around escalator openings, within exit stairs and within air handling systems. The objective of the smoke control system is to provide tenable (non-life threatening) conditions within which persons may exit the building. Central to the smoke protection strategy, according to the Applicant, will be the proposed system's ability to provide a smoke layer maintained at 2.4 m above the upper concourse floor level.

The second issue in dispute involves the fire separation of exit stairs at the upper concourse level, or mezzanine. There are four exit stairs serving this level, one located roughly in the four corners of the building. The Applicant is proposing to omit the fire-rated doors at the exit stairs and in doing so would not be providing a continuous separation. This is being done in order to facilitate the ease of egress from the building, especially in an emergency situation. In lieu of the required doors, he is offering to pressurize the exit stairs in question. (It is also proposed that the escalators will have the ability to be reversed, i.e., to travel in a downward direction at the end of an event in the main bowl, to ease day-to-day egress from the building.)

The extent of sprinkler coverage is the final matter in dispute. The Applicant is proposing what he describes as "enhanced sprinkler coverage", which is essentially based on NFPA 101, but is not full coverage throughout the structure as is permitted by NFPA 101. In particular, the Applicant intends to omit the sprinkler coverage over the ice surface area. At its maximum, the height from the event floor area to the under side of the ceiling structure is 23 m. At this distance, in the Applicant's view, sprinklers might not be effective, or would certainly take longer to activate.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the fire safety measures provided by conformance with NFPA 101-2000, "Life Safety Code" and NFPA 92B, "Smoke Management Systems in Malls, Atria and Large Areas" provide sufficiency of compliance with Articles 3.3.2.3., 3.3.2.4., 3.4.3.4. and 3.1.8.1. and Sentence 3.2.5.13.(1) of the Ontario Building Code.

Article 3.3.2.3. determines the requirements, with certain exceptions not applicable here, for row widths for fixed seating in assembly occupancies. As noted in the previous section, the Applicant is proposing narrower seat rows. Specifically, he intends to construct the row widths in the subject arena at 459 mm in the lower bowl and 484 mm in the upper bowl instead of the 520 mm width required by Code for this particular building under Sentence (1) of Article 3.3.2.3. (in conjunction with Sentence (11.2) of the following Article 3.3.2.4.).

Article 3.3.2.4., also with exceptions that are not applicable to the present instance, sets out the requirements for aisles in assembly occupancies that contain fixed seating. This provision mandates that for the subject arena; the maximum number of seats per clear row width is 16, the aisle widths are required to be 1,936 mm (in the lower bowl with event floor seating included as the worst case scenario), and the required vomitory width is 3,567 mm (using the same scenario as above). In contrast, using the intended NFPA 101 design approach, the Applicant's corresponding figures are proposed as; a maximum of 29 seats per row, a lower bowl aisle width of 1,200 mm, and a lower bowl vomitory width of 1,500 mm.

Exit capacity which, in turn, determines exit width for occupancies such as stadia, is provided in Sentence (1) of Article 3.4.3.4. This provision stipulates that in the present case, the exit capacity must be based on 8 mm per person (in upper bowl as worst case). Utilizing this figure yields a mandatory aggregate exit width of 27.2 m for the upper concourse exit stairs. Based on NFPA 101, the Applicant is proposing an exit capacity based on 3.2 mm per person resulting in 12 m of total exit width provided at the upper concourse exit stairs.

In essence, rather than comply with the requirements for fixed seating under Article 3.3.2.3., aisles under Article 3.3.2.4. and exits under Article 3.4.3.4., the Applicant is proposing to comply with the requirements for smoke-protected assembly seating facilities under NFPA 101-2000. In doing so the smoke protection would be provided in accordance with NFPA 92B standards. It is noted that to some degree, compliance with these NFPA standards would provide several safety features that exceed Building Code requirements, such as smoke protection for the concourses, the exit stairs and escalator openings, fire protection of electrical conductors, two hour emergency power for life safety systems, etc. This approach, however, does not comply with the prescriptive wording of Articles 3.3.2.3., 3.3.2.4. and 3.4.3.4. of the Code.

With respect to the fire separation of the stairs, the proposed removal of the fire-rated doors at the upper concourse floor level is dealt with in Article 3.1.8.1. In Sentence (1) of this provision it states that a wall assembly required to be a fire separation must be constructed as a continuous element. In addition, Sentence (2) stipulates that if there is to be an opening in such a fire separation for, say, a door, that opening shall be protected in the prescribed manner. In the present case, fire-rated doors would be required to maintained the continuity, and thus the integrity, of the separation. As noted, the Applicant has proposed to remove such fire-rated doors to facilitate better egress in an emergency situation, but has offered pressurization of the stairs as compensation. It should be noted, however, that NFPA 101, to which the Applicant is designing much of the facility, also requires that the fire separation around the exit stairs be maintained.

Regarding the matter of sprinklering, OBC 3.2.5.13.(1) is applicable. This provision states that for the facility at hand sprinkler protection must be provided in conformance with NFPA 13, "Standard for the Installation of Sprinkler Systems". In turn, the NFPA 13 standard requires that the building be fully sprinklered. This would include over the central ice surface/event floor area. NFPA 13, unlike NFPA 101, requires sprinkler protection in all parts of a building's floor areas. As discussed, the Applicant has proposed to omit sprinkler coverage over the ice surface or event area floor area.

4. Provisions of the Ontario Building Code

Article 3.1.8.1 General Requirements

(1) Any wall, *partition* or floor assembly required to be a *fire separation* shall
- (a) except as permitted by Sentence (2), be constructed as a continuous element (see Appendix A), and
- (b) as required in this Part, have a *fire-resistance rating* as specified (see Appendix A).

(2) Openings in a *fire separation* shall be protected with *closures*, shafts or other means in conformance with Articles 3.1.8.4. to 3.1.8.17. and Subsections 3.1.9. and 3.2.8. (See Appendix A.)

Sentence 3.2.5.13.(1) Automatic Sprinkler Systems

(1) Except as permitted by Sentences (2), (3) and (4), an automatic sprinkler system shall be designed, constructed, installed and tested in conformance with NFPA 13, "Standard for the Installation of Sprinkler Systems". (See Appendix A.)

Article 3.3.2.3. Fixed Seats

(1) Except for the requirements of Article 3.3.2.7. for bench-type seats and except as required or permitted by Sentence (2) and Articles 3.3.2.9. and 3.3.2.10., fixed seats in places of assembly shall be
- (a) attached or secured to the floor, platform or platform riser,
- (b) provided with arms and back, and
- (c) arranged in rows having an unobstructed passage not less than 400 mm (15¾ in) wide measured horizontally between plumb lines from the backs of the seats in one row and the edges of the furthest forward projection of the seats in the next row in the unoccupied position.

(2) For fixed seats with backs and with folding tablet arms, the value of 400 mm (15¾ in) required by Clause (1)(c) shall be measured when the tablet arms are in the use position, but is permitted to be measured in the stored position provided
- (a) there are not more than 7 seats between any seat and the nearest aisle,
- (b) the seats are located in a lecture hall or an auditorium used for instructional purposes, and
- (c) the tablet arm, when raised manually to a vertical position, falls by the force of gravity to the stored position. (See Appendix A.)

(3) Except as permitted by Sentences (4) and (5), aisles shall be located so that there are not more than 7 seats with backs or 20 seats without backs between any seat and the nearest aisle.

(4) The requirements of Sentence (3) do not apply if
- (a) egress doorways are provided to serve both ends of rows of seats,
- (b) each doorway referred to in Clause (a) serves not more than 3 rows of seats, and
- (c) each row contains not more than 100 seats.

(5) The requirements of Sentence (3) do not apply if
- (a) there are not more than 7 seats between any seat and the nearest aisle, where the seats are served by a single aisle,
- (b) there are not more than 20 seats between any seat and the nearest aisle, where the seats are served by two aisles,
- (c) each row has an unobstructed passage with minimum width of 400 mm (15¾ in) plus 6.1 mm (¼ in) for each additional seat above 16 seats in the row, and
- (d) the travel distance is not more than 45 m (147 ft 8 in) measured along the path of travel from any seat to an *exit* or to an egress doorway.

(6) Seating arrangements that do not conform to the requirements of Sentences (3) to (5) are permitted provided the standard of safety is not reduced and the time required for egress is not increased.

Article 3.3.2.4. Aisles

(1) Except as required by Articles 3.3.2.7., 3.3.2.9. and 3.3.2.10., aisles leading to egress doors or *exits* shall be provided in conformance with Sentences (2) to (24) in places of assembly which contain fixed seats.

(2) In this Subsection, a converging aisle is an aisle into which the occupants of 2 or more aisles converge in travelling to an *exit*.

(3) An aisle shall terminate at
- (a) a converging aisle,
- (b) an egress doorway from the seating area, or
- (c) an *exit* from the seating area.

(4) A converging aisle shall terminate at
- (a) an egress doorway from the seating area, or
- (b) an *exit* from the seating area.

(5) The minimum clear width of aisles shall be not less than 1 100 mm (3 ft 7 in), except that the width is permitted to be reduced to not less than

(a) 750 mm (2 ft 6 in) if serving not more than 60 seats, and

(b) 900 mm (2 ft 11 in) if serving seats on one side only.

(6) The minimum clear width of each aisle shall be measured at the point in the aisle furthest from

(a) an egress doorway referred to in Clause (12)(a),

(b) an *exit* referred to in Clause (12)(b), or

(c) an *exit* referred to in Sentence (13).

(7) Except for an aisle serving bleacher seats, where rows of seats discharge into an aisle, the minimum clear width required by Sentence (5) shall be increased by 25 mm for each metre of length of the aisle measured in the direction towards an *exit*.

(8) The width of a converging aisle shall be not less than the required width of the widest aisle plus 50% of the total required width of the remaining aisles that it serves.

(9) If rows of seats discharge directly into the converging aisle, the width required by Sentence (8) shall be increased by 25 mm (1 in) for each metre of length of the aisle where the rows of seats discharge into the aisle.

(10) The width of an egress doorway or an *exit* leading directly from the seating area shall be not less than the required width of the widest aisle or converging aisle plus 50% of the total required width of the remaining aisles and converging aisles that it serves.

(10.1) The requirements in Sentences (5) to (10) and Sentence (14) do not apply if

(a) the minimum clear width of an aisle is in accordance with Article 3.3.1.16., but is not less than 900 mm (2 ft 11 in) if serving seats on one side only,

(b) the minimum clear width of an aisle is in accordance with Article 3.3.1.16., but is not less than 1 200 mm (3 ft 11 in) if serving seats on both sides,

(c) the minimum clear width of a converging aisle is in accordance with Article 3.3.1.16., but not less than the width of the widest aisle leading to the converging aisle,

(d) the minimum clear width of an *exit* leading directly from the seating area is in accordance with Article 3.4.3.4.,

(e) except as provided in Clause (f), the minimum clear width of an egress doorway leading directly from the seating area is in accordance with Article 3.3.1.16., but not less than the required width of the aisle or the converging aisle leading to the doorway, and

(f) if more than one vomitory is provided

(i) the minimum total clear width of the egress doorways leading from one vomitory is not less than the required width of the aisle or the converging aisle leading to the doorways, and

(ii) the minimum clear width of egress doorways from additional vomitories is in accordance with Article 3.3.1.16.

(11) Except as provided in Sentences (11.1) and (11.2), dead-end aisles shall be not more than 6 m (19 ft 8 in) long.

(11.1) Dead-end aisles are permitted to be more than 6 m (19 ft 8 in) long, but not more than 10 m (32 ft 10 in) long if

(a) the seating area is separated from other seating areas and adjacent *occupancies*, including a corridor serving any seating area, by a *fire separation* in accordance with Sentences 3.3.2.2. (1) and (2),

(b) the travel distance is not more than 25 m (82 ft) measured along the path of travel from any seat to an *exit*, to an egress doorway or to an opening into a vomitory,

(c) at least one *means of egress*, comprising not less than 30 per cent of the required *exit* capacity, is through an exterior *exit*, an *exit* stairway or a corridor not containing an *occupancy*,

(d) each row served by the dead-end aisle has a minimum unobstructed width of 400 mm (15¾ in) plus 6.1 mm (¼ in) for each additional seat above 7 seats in a row, but not more than 550 mm (21⅝ in),

(e) the minimum ceiling height above the seating area is 3 m (9 ft 10 in),

(f) the activation of a *fire detector* or a sprinkler head in the seating area will

(i) cause the shutdown of the projection system serving the seating area, and

(ii) turn on the normal lighting in the seating area, and

(g) the *floor area* is *sprinklered*.

(11.2) Dead-end aisles are permitted to be more than 10 m (32 ft 10 in) long, but not more than 13 m (42 ft 7 in) long if

(a) the seating area is separated from other seating areas and adjacent *occupancies*, including a corridor serving any seating area, by a *fire separation* in accordance with Sentences 3.3.2.2. (1) and (2),

(b) the travel distance is not more than 25 m (82 ft) measured along the path of travel from any seat to an *exit*, to an egress doorway or to an opening into a vomitory,

(c) at least one *means of egress*, comprising not less than 30 per cent of the required *exit* capacity, is through an exterior *exit*, an *exit* stairway or a corridor not containing an *occupancy*,

(d) each row served by a dead-end aisle has a minimum unobstructed width of 400 mm (15¾ in) plus 6.1 mm (¼ in) for each additional seat above 7 seats in a row, but not more than 550 mm (21⅝ in),

(e) the activation of a *fire detector* or a sprinkler head in the seating area will

(i) cause the shutdown of the projection system serving the seating area, and

(ii) turn on the normal lighting in the seating area,

(f) a voice communication system is installed in conformance with Article 3.2.4.22.,

(g) a smoke control system is installed to control movement of smoke in the seating area or a smoke exhaust system is provided so that, in the event of detection of smoke by a *smoke detector* in the seating area, air handling equipment is activated to extract air directly from the seating area at the rate of at least 6 air changes per hour, and

(h) the *floor area* is *sprinklered*.

(12) Where a seating area is separated as required by Sentences 3.3.2.2.(1) and (2) or 3.3.2.2.(8), the length of travel by any aisle shall be not more than 45 m (147 ft 8 in) measured from the most remote point of the aisle to

(a) an egress doorway in the required separation, or

(b) an *exit* leading directly from the seating area.

(13) Where a seating area is not required to be separated by Sentences 3.3.2.2.(1) and (2) or 3.3.2.2.(8), the travel distance shall be not more than 45 m (19 ft 8 in) measured from the most remote point of the aisle to an *exit*.

(14) Side aisles shall be not less than 1 100 mm (3 ft 7 in) wide if seating is provided in conformance with Sentence 3.3.2.3.(4).

(15) An aisle that has a slope not more than 1 in 8 shall not be stepped.

(16) An aisle that slopes more than 1 in 8 shall be stepped.

(17) The passageway between rows of seats served by a stepped aisle shall be level at right angles to the line of travel.

(18) The riser of a step in an aisle shall be

(a) not less than 110 mm (4⅜ in) high, and

(b) not more than 200 mm (7⅞) high.

(19) Variations are permitted in riser height provided

(a) the height of adjacent risers does not vary by more than 6 mm (¼ in), and

(b) the depth of a tread or a platform in the direction of travel is not less than 430 mm (16⅞ in).

(20) Steps in an aisle shall

(a) have a run not less than 230 mm (9 in) exclusive of nosings,

(b) have a tread depth not less than 250 mm (9⅞ in),

(c) extend to the adjacent rows of seats in a manner that will not create a hazard from tripping, and

(d) have a finish on the treads conforming to Sentence 3.4.6.1.(1).

(21) The location of every riser in an aisle shall be made apparent from both directions of travel by strategically placed lighting or contrasting marking stripes.

(22) A platform in an aisle shall be level, except that a slope not more than 1 in 50 is permitted for a platform that is not less than 430 mm (16⅞ in) deep in the direction of *exit* travel.

(23) If a step is used at the entry to a row of seats from a stepped aisle, an unobstructed platform not less than 800 mm (2 ft 7 in) square shall be provided adjacent to the aisle.

(24) The finish of the surface of a platform in or adjacent to a stepped aisle shall conform to Sentence 3.4.6.1.(1).

Article 3.4.3.4. Exit Capacity

(1) Except as permitted by Sentence (3), the aggregate required width of *exits* serving *floor areas* intended for *assembly occupancies*, *residential occupancies*, *business and personal services occupancies*, *mercantile occupancies*, and *industrial occupancies* shall be determined by multiplying the *occupant load* of the area served by

(a) 6.1 mm (¼ in) per person for ramps with a slope not more than 1 in 8, doorways, corridors and passageways,

(b) 8 mm (5/16 in) per person for a stair consisting of steps whose rise is not more than 180 mm (7⅛ in) and whose run is not less than 280 mm (11 in), or

(c) 9.2 mm (⅜ in) per person for

(i) ramps with a slope more than 1 in 8, or

(ii) stairs, other than stairs conforming to Clause (b).

(2) The aggregate required width of *exits* serving *floor areas* intended for *care or detention occupancy* shall be determined by multiplying the occupant load of the area served by 18.4 mm (¾ in) per person.

(3) The required width of *means of egress* serving a Group A, Division 4 *occupancy* shall be determined by multiplying the *occupant load* of the area served by

(a) 1.8 mm (1/16 in) per person for

(i) aisles,

(ii) stairs other than *exit* stairs, and

(iii) ramps and passageways in vomitories and *exits*, and

(b) 2.4 mm (3/32 in) per person for *exit* stairs.

5. Applicant's Position

The Agent for the Applicant submitted that the standards for assembly occupancies set out in the Code do not adequately address large arenas of the type anticipated here. The provisions apply more appropriately to smaller indoor arenas or large outdoor venues. Unfortunately, for the construction of buildings of this size, however, the OBC and other codes have not been updated to address large arena design. Moreover, the process for change in the Building Code to recognize this situation has been slow. He noted that the reason for this may be that the frequency of construction of this type of facility is not sufficient to prompt a significant, timely change.

In the case under dispute, the Agent argued that because of site restrictions, the proposed 9,000 seat facility, designed in a conventional hockey arena layout, would not meet all of the requirements outlined in the Ontario Building Code. In lieu of strict compliance with the OBC, they have proposed to design the main arena seating bowl with "smoke-protected" seating and egress routes in conformance with NFPA 101-2000 "Life Safety Code. He argued that this proposed design, which includes compliance with NFPA 92B, could achieve sufficiency of compliance with the requirements outlined in the Building Code in respect to fixed seating, exits and aisle and vomitory widths. The Agent submitted that several other arenas throughout the province have been designed and built according to these standards. He indicated that they have been involved with utilizing these design principles in the Air Canada Centre in Toronto, the Corel Centre in Ottawa and General Motors Place in Vancouver.

In his outline of the proposal, the Agent advised that the Applicant intends to use smoke management as compensation for the seating and exiting issues addressed by Building Code requirements. Smoke-protection would be achieved by the inherent height and volume of the bowl and concourses in conjunction with the mechanical smoke-protection measures that would be provided. Such measures are not required under a literal application of the minimum OBC requirements, however, they are necessary to achieve smoke-protected assembly seating and egress routes under the proposed application of NFPA 101-2000 and NFPA 92B. These measures include smoke exhaust and make-up air provisions for the bowl and the concourses, as well as the provision of an emergency air supply to the exit stairs.

In addition, the Agent argued that although the structure is less than 18 m in height, many of the safety features generally applicable to high rise buildings are also proposed. These features include the provision of emergency voice communication; fire protection of electrical conductors and a 2 hour emergency power supply for life safety equipment; a central alarm and control facility; and, an active fire alarm annunciator and control panel. These proposed measures are also based on the application of NFPA 101-2000 standards and would not be required under the provisions of the Building Code.

In summation, the Agent submitted that it is appropriate in this instance to use an alternate standard for areas where the requirements of the OBC cannot reasonably be achieved. By using NFPA 101-2000 and NFPA 92B standards jointly with the OBC, an equivalent level of life safety would be provided in lieu of the prescriptive requirements outlined in the Code for the three areas in dispute.

6. Respondent's Position

The Respondent submitted that while he agrees the Code does not address large stadia well and despite the fact he does not oppose the use of NFPA 101-2000 and NFPA 92B, there is no authority or jurisdiction in the Building Code Act for a Chief Building Official to approve an alternative. They may authorize alternate materials and systems, but not design.

The Respondent did submit, however, that if NFPA standards are to be accepted, they should be

consistently applied. This would require that doors be provided at the exit stairs in the upper concourse level. He noted that not only does OBC Article 3.1.8.1. require that the separation surrounding the exit stairs be continuous but so too does NFPA 101. The Respondent stated that he thought it was the Applicant's intention of conforming to NFPA 101 in its entirety. If so, why it is proposed to leave out the required fire-rated doors? Moreover, neither the OBC nor NFPA 101 specifically permits such fire separations to be waived if the exit stairs are pressurized.

The Respondent continued by arguing that the entire facility should be sprinklered, including over the ice surface/event floor area. In addition, a Life Safety Evaluation must be done to cover panic situations not related to smoke or fire. He also asserted that any mechanical smoke control system should be a dedicated air handling facility. In his opinion, it should not be combined with the regular air handling system.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed egress system, which includes seating configuration, row width, vomitory and aisle width, exits and access to exits, designed in accordance with NFPA 101, 2000 "Life Safety Code", and contained in a building equipped with a Smoke Management System conforming to NFPA 92B, "Smoke Management Systems in Malls, Atria and Large Areas", provides sufficiency of compliance with Articles 3.3.2.3., 3.3.2.4. and 3.4.3.4. of the Ontario Building Code at the London Sports and Entertainment Centre on condition that:

i) The building will be sprinklered in its entirety, including the area over the ice surface/event area.

ii) Smoke detection devices will be provided throughout the upper and lower concourses.

iii) A maximum of four minutes travel time will be maintained between the most remote seat and vomitory.

iv) A Life Safety Evaluation study will be submitted and accepted by the municipality before occupancy.

v) Fire-rated doors will be provided at the top of the exit enclosures.

8. Reasons

The combination of the proposed detection, suppression and smoke control systems offered as compensation in lieu of an OBC conforming egress system will provide an equivalent level of fire safety in the subject arena.

Designate for the Respondent

RULING

1. The Applicant

Mr. Joe Bazarin, owner, Port Perry, Ontario, has applied for a building permit under the Building Code Act, 1992 to install a Class 4 sewage system at Conc. 3, Plan 412, Sub lot 25, in the Township of Alnwick, Ontario.

2. Description of Construction

The Applicant is proposing to install a Class 4 sewage system to service a Group C - residential building currently under construction. When completed the building will have three bedrooms, a total of 25.5 plumbing fixture units, and a finished area of 195 m2. The calculated daily design sewage flow will be 1875 Litres.

The site in dispute is a country lot covering an approximate area of 0.5 hectare, mostly covered with mature trees. The slope of most of the site (except where the building is being constructed) is more than 25%. The soil cover is estimated to be 0.7 metre underlaid by a clay till with an estimated percolation time of more than 50 min/cm. The water supply to the site is provided by a drilled well.

The dispute involves the steep slope of the site and the modifications proposed in the design of the filter bed area in order to reduce this slope.

To overcome the slope issue, the Applicant is proposing extensive re-engineering of the site by clearing existing vegetation, removing the natural soil, cutting terraces into the slope, and creating a swale to divert surface water run-off.

The proposed system is a Class 4 sewage system to be constructed at the north-east corner of the property. The system will consists of a 3800 L two-compartment septic tank, a gravity-fed filter bed with a surface area of 48 m2, and a contact area of 200 m2. The filter bed is to consist of six 7.5 metre distribution pipes placed level on the terraces. There will be a minimum of 0.7 m of filter sand underlying the pipes and a minimum of 0.15 m crushed or washed stone covering them. The bed will be finish-graded with a crown above it to promote drainage.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed sewage system, which includes terraced distribution pipe runs, provides sufficiency of compliance with Clause 8.7.2.1.(1)(a) of the Ontario Building Code.

Clause 8.7.2.1.(1)(a) prohibits the construction of a leaching bed in an area with an average slope of more than 25% (four units horizontally per one unit vertically). The slope of the site proposed for construction of the filter bed is between 27 to 33 percent. The Applicant is proposing some engineering modifications to the filter bed area including constructing terraces for the distribution pipe runs in order to alter this slope and achieve compliance with the Code's requirements.

At issue is whether the proposed modifications adequately compensate for the site's slope.

4. Provisions of the Ontario Building Code

Clause 8.7.2.1. General Requirements

(1) A *leaching bed* shall not be located:

(a) in an area that has an average slope that exceeds one unit vertically to four units horizontally,

5. Applicant's Position

The Agent for the Applicant submitted that the filter bed system as designed would be stable, and meet the requirements of the Ontario Building Code.

The Agent stated that the Applicant is proposing to shave down the area to a depth of between 0.3 m to 0.6 m and cut into the existing grade to provide the required slope. Based on the information provided to the Agent by the engineering firm he retained, it is assumed that the slope at the clay level is fairly uniform and most likely less steep than the surface level. As a result, it is possible to re-grade and create the required 1:4 slope, he argued.

The Agent continued that in order to prevent water run-off from entering the bed area, the Applicant is proposing to maintain the drainage in a north-west direction by creating a swale at the top of sloping area.

The Agent then provided the following responses for issues raised during the hearing:

Regarding the conflicting information provided on the site survey map (topographical information) and site plan, as raised by the ministry's Code Advisor during the hearing, the Agent agreed to re-evaluate the information and provide the Commission and the Respondent with accurate data.

Regarding the Respondent's concern over erosion, the Agent argued that erosion can only occur if a proper method is not introduced to prevent it and they were proposing terracing, which is a known method for preventing erosion.

In conclusion, the Agent stated that although they agree with the Respondent about the steep slope (over 30%) of the site, by re-grading the area and providing terraces, they not only reduce the slope of the site to an appropriate level, but they also provide stability under the bed area.

6. Respondent's Position

The Respondent submitted that the site for the proposed installation of the Class 4 filter bed sewage system has a slope over 25%, which is not allowed under the Ontario Building Code.

At the outset, the Respondent referred to site conditions that would neutralize the effectiveness of the proposed design as follows:

> A slope of over 33% where the filter bed is proposed to be constructed;
>
> The high groundwater table during the spring season; and,
>
> Very heavy clay into which the proposed terraces are to be cut.
>
> The Respondent then argued that they believe the proposed design can neither solve the problem of the slope nor assure its stability. The Respondent based his argument on the following facts:
>
> The proposal involves extensive engineering of the site, removal of better soil at the top of the soil strata and
> cutting of all mature trees, which can act as a barrier against erosion;
>
> The material that is removed to level out the slope must be replaced with

imported material;

Without knowing the exact steepness of clay soil within the slope at the area of the proposed filter, the
Respondent was not convinced that overall slope can be reduced to less than 25%; and,

The proposed filter bed must be a raised bed system. This is consistent with the fact that the majority of the
properties in this area are serviced by a raised bed system. The finish grade where the bed can be raised has
a slope of 25%. Putting a raised bed on a slope of 25% creates stability concerns.

The Respondent also argued that, as far as he is concerned, cutting into clay is not allowed under the Code. In addition, although he is familiar with terraced tile runs in conventional leaching beds, he has never seen a step-down filter bed.

The Respondent concluded that the area where the foundation of the cottage has been constructed has a slope of 21% and is large enough to accommodate a filter bed. However, despite their advice, the Applicant did not consider this option and constructed the footings without a permit.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed modified filter bed to be built on a slope of more than 25% (four units horizontally and one unit vertically) does not provide sufficiency of compliance with Clause 8.7.2.1.(1)(a) of the Ontario Building Code.

8. Reason/s

i. The Commission is not satisfied that the changes proposed to alter the slope steepness of the bed area have addressed the slope stability in the long run.

RULING

1. The Applicant

Mr. Ken Page, Owner, Ontario, has applied retroactively for a building permit under the Building Code Act, 1992 for the construction of a stairway previously added to a exterior deck at his cottage at 1821 Fire Route 12A - Pt. Lot 24, Conc. 13, Smith Ward, Ontario.

2. Description of Construction

The Applicant received a building permit in 1994 to construct a Group C - residential cottage in the Township of Smith Ward. In 1995, before the construction of the cottage was completed, the Applicant added a stairway to the deck at the front of the cottage. The stairs were not included in the original plan submitted for the building permit, however, they were constructed after the final inspection of the sewage system by the then authority responsible for enforcing on-site septic regulations.

The cottage is serviced by a Class 4 sewage system consisting of a septic tank and a filter bed. The subject deck extends 2.13 m over a portion of the septic tank. There are six posts supporting the deck. Each post stands on a cement pad. Two posts have been constructed in close proximity to the side walls of the septic tank. The clearance between the deck and top of the septic tank is less than 1.5 m. Moreover, the deck also extends within 1.83 m from the filter bed and there is a stairway leading to the deck that is situated 1.06 m from the north-west corner of the filter bed.

The dispute involves the clearance distances maintained between the deck and the septic tank and between the stair and the filter bed.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the construction

of a deck, extending 2.13 m over a portion of an existing septic tank and the stairs serving the deck situated within 1.06 m of the existing filter bed, provide sufficiency of compliance with Sentence 8.2.1.6.(1) and 8.2.1.6.(2) of the Ontario Building Code.

Both Sentences 8.2.1.6.(1) and 8.2.1.6.(2) govern the minimum clearance distances that must be maintained between components of a Class 4 or 5 sewage system and structures or natural foundations. However, according to Sentence 8.2.1.4.(1), complying with these provisions can be waived where, in the case of soils with a percolation time of 10 min/cm or greater, it is proved that maintaining these distances are not necessary. In other words, compliance with the above provisions can be waived in certain circumstances, if it is proved that the operation and maintenance of a sewage system is not negatively effected as a result of lesser clearance distances than those required by the Code. Since the soil at the site under dispute has a percolation time of 10 min/cm, Sentence 8.2.1.4.(1) is therefore applicable.

According to Sentence 8.2.1.6.(1), the horizontal clearance distances between a treatment unit such as a septic tank and any structure or natural foundation must not be less than the values set out in Table 8.2.1.6.A.. As given in Table 8.2.1.6.A, the minimum clearance distance between a septic tank and a structure must be at least 1.5 m. The minimum clearance distances to be maintained between distribution pipes (a leaching bed or filter bed) and structures or natural foundations are provided in Table 8.2.1.6.B, referenced by Sentence 8.2.1.6.(2). As set out in this Table, the minimum clearance distance that must be maintained between a structure and any part of a bed must be 5 metres. As noted, the subject deck as constructed, extends 2.13 m over a portion of the septic tank. The distance between the stairs and the north-west corner of the filter bed is 1.06 m.

At issue is whether maintaining the clearance distances required by Sentences 8.2.1.6.(1) and 8.2.1.6.(2) would be unnecessary given the circumstances at the site.

4. Provisions of the Ontario Building Code

8.2.1.4. Clearances

(1) Unless it can be shown to be unnecessary, where the percolation time is 10 minutes or greater, the location of all components within a sewage system shall be in conformance with the clearances listed in Articles 8.2.1.5. or 8.2.1.6.

Sentence 8.2.1.6. Clearances for a Class 4 or 5 Sewage System

(1) Except as provided in Sentences 8.2.1.4.(1) and (2), a *treatment unit* shall not be located closer than the minimum horizontal distances as set out in Table 8.2.1.6.A.

(2) Except as provided in Sentences 8.2.1.4.(1) and (2), a distribution pipe shall not be located closer than the minimum horizontal distances set out in Table 8.2.1.6.B. and these distances shall be increased when required by Sentence 8.7.4.2.(9).

5. Applicant's Position

The Agent for the Applicant stated that although the stairs were not included in the original plans submitted for the building permit and were added later, in the final inspection done in 1996 for occupancy permit, there was no mention of then built stairs as an unacceptable addition to the building.

The Agent continued that last summer the Applicant was granted a minor variance by Smith Ward's committee of adjustment that required setback reductions in the front and rear of his property. It was during these set back adjustments that the Chief Building Official required the Applicant to apply for a building permit to legitimize construction of the stairs. However, after an application was submitted by the Applicant, the Chief Building Official refused to grant a building permit unless the existing clearance distances between the deck and the septic tank and stairs and the filter bed were modified to meet the requirements of the Code or were approved by the Health Unit or by the Building Code Commission.

The Agent argued that, during the last five years of use, the sewage system has been functioning properly and there has been no problem associated with its maintenance. During this period, the septic tank has been pumped out several times without any difficulty in accessing to the tank, he emphasized.

The Agent concluded that although the Applicant would like to keep the deck and stairs as they are, he (the Applicant) would do whatever required to prevent any potential problem that may arise in the future.

6. Respondent's Position

The Respondent submitted that the existing clearance distances between the deck and septic tank do not meet the requirements of the OBC.

The Respondent argued that as far as the Health Unit is concerned, the deck is part of a structure, so it is required to maintain the same clearance distances with different components of a sewage system as a structure must. However, he also agreed that there are some situations where complying exactly with requirements of the Code is not

possible. Moreover, such situations usually have little if any negative impact on the performance of a septic system. Indeed, he acknowledged that there has been no malfunctioning of the system due to the current clearance distances, nor any problem regarding the accessibility of the tank during the last five years of use.

Nevertheless, the Respondent concluded by reiterating that the required clearances were not being met and they had no choice but to refuse the Applicant's submission.

7. Commission Ruling

It is the decision of the Building Code Commission that the current clearances from the existing septic tank and deck and from the exiting distribution pipe to the stair and deck provide sufficiency of compliance with Sentences 8.2.1.6.(1) and 8.2.1.6.(2), on condition that:

1. The supports for the deck in the vicinity of the tank are modified to spread the load over 61 cm by 61 cm (two feet by two feet) pads not bearing on the tank.

8. Reasons

i. The modifications to the support of the deck in the vicinity of the tank will reduce any potential impact on the tank.
ii. The performance of the septic tank and the filter bed apparently have not been impacted by the deck and stairs over the past five years.

Dated at Toronto this **7th,** day in the month of **December** in the year **2000** for application number **2000-69**.

RULING

1. The Applicant

Mr. Bruno G. Schickedanz, B.G. Schickedanz Homes Inc., Woodbridge, Ontario, has received an order to comply under the Building Code Act, 1992 to rectify certain alleged deficiencies in respect to the construction of a townhouse complex known as Riverboat Landing, Charlton Settlement Avenue and Rivers Edge Drive, 1400 Weston Road, Toronto, Ontario.

2. Description of Construction

The Applicant has constructed a townhouse complex consisting of 43 townhomes arranged in 7 blocks. The buildings have a Group C occupancy classification, a building area of less than 600 m^2 and are three storey in building height. Throughout the townhouse blocks are five units subject to this dispute. These are identified as Units 9 and 10, fronting onto Charlton Settlement Avenue and Units 13, 15 and 17, fronting onto Rivers Edge Drive. The units are called the Simcoe and York models and have floor areas of 111.48 m^2 (1,200 ft^2) and 104.05 m^2 (1,120 ft^2) respectively. All of the buildings are comprised of combustible construction.

The construction in dispute involves the width of the exterior covered concrete stairs and landings which form part of the required exit from each of the subject units. The front entrance to each unit is located approximately 1,371 mm (4 ft 6 in) to 1,524 mm (5 ft) above grade and is recessed behind the front wall face of the subject dwelling. The widths of the front stairs and landings range from 814 mm (Unit 15) to 850 mm (Units 10 and 13) when measured between the adjacent wall faces. The front door to each of the units measures 790 mm (31 in) in width.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the as-built concrete stairs and landings at the front of the subject units provide sufficiency of compliance with Articles 9.8.3.3., 9.8.4.1. and 9.9.3.2. of the Ontario Building Code.

Sentence (1) of Article 9.8.3.3. requires a minimum width for exit stairs, when measured between wall faces or guards, of 900 mm (2 ft 11 in). In the case at hand, the as-built stairs form part of a required exit from the dwelling units in question and as a result, the 900 mm minimum width requirement applies. The stair widths, however, measure between 814 mm (32 in) and 850 mm (33 ½ in) rather than the required 900 mm.

Further, Article 9.8.4.1. requires that landings shall be at least as wide and as long as the width of the stairs in which they occur. This article continues by providing certain exemptions for that length of some landings, however, it offers no relief for the width requirement (i.e., must be the same as stairs) of landings. In this instance, while the landings are generally the same width as the stairs in which they occur, like the stairs, they do not meet the minimum 900 mm width requirement.

Article 9.9.3.2. further prescribes the widths of required exits, mandating that (except for doors and corridors) the width of every exit facility shall be not less than 900 mm. As already noted, the as-built stairs and landings, with measurements between 814 mm and 850 mm, do not meet this minimum standard.

4. Provisions of the Ontario Building Code

Article 9.8.3.3. Stair Width

(1) *Exit* stairs and stairs used by the public shall have a width, measured between wall faces or *guards*, of not less than 900 mm (2 ft 11 in).

(2) At least 1 stairway between each floor level in a *dwelling unit* shall have a width between wall faces of not less than 860 mm (2 ft 10 in).

Article 9.8.4.1. Dimensions of Landings

(1) Landings shall be at least as wide and as long as the width of stairs in which they occur, except that

(a) the length of landing for exterior stairs serving not more than 1 *dwelling unit* need not exceed 900 mm (2 ft 11 in), and

(b) the length of landing for all other stairs in a straight run need not exceed 1 100 mm (3 ft 7 in).

(See also Articles 9.9.6.2. and 9.9.6.6. for landings in *exits*.)

Article 9.9.3.2. Exit Width

(1) Except for doors and corridors, the width of every *exit* facility shall be not less than 900 mm (2 ft 11 in). (See Article 9.9.6.4. for doors and Subsection 9.8.3. for stairs.)

5. Applicant's Position

The Agent for the Applicant began by providing the Commission with some background information, explaining that construction of the townhomes commenced in the fall of 1999. The issue of non-compliance was discovered in late winter or early spring of 2000, when an order to comply was issued by the City. At this point, he argued, it was too late to halt construction and alter the design to comply with the OBC. He advised that the townhomes are now built and occupied. In his opinion, safety is not reduced because of the differential in stair and landing widths. He noted that the as-built condition is only slightly less than the minimum requirement.

The Agent stated that his client did not intentionally construct the stairs and landings to be non-compliant with the OBC requirements. He indicated that, the problem occurred as a result of a construction error. Specifically, it appeared that the landings were built without taking into consideration the thickness of the masonry veneer used on the lower portion of the townhouses. In effect, the masonry veneer thereby narrowed the landing areas and the stairs were subsequently built to the same narrowed width as the landings.

The Agent then argued that the stair and landing widths are greater than the width of the associated doors and, as such, it is his opinion that if a person can pass through the wooden door frame, they are also able to pass through the landing area. In addition, he submitted that more than the required number of exits have been provided within each unit. An occupant, he argued, has the option of exiting from the front door, the rear door or any one of the operable casement windows on the second and third floors. In addition, many of the units have access to the garage from the interior of the dwelling.

In summation, the Agent submitted that the Code violation in this instance was a genuine mistake. The stairs and landings were constructed unintentionally narrow and given the extenuating circumstances involved, rectifying the situation would have been difficult at the time the order to comply was issued. The Agent again emphasized that additional means of egress from the buildings had been provided, stating that safety would not be compromised in this instance.

6. Respondent's Position

The Designate for the Respondent submitted that a permit had not been issued for this development at the time construction commenced. The permit plans, however, indicated landings and stairs which would have been wide enough to satisfy the OBC requirements. In his opinion, it was not too late to remedy the situation at the time the order was issued. There were alternatives available to the Applicant that were not pursued. In fact, stucco was used on the wall face of one of the units that was identified prior to finished construction. Using a similar material here may have resolved the dispute involving the units in question.

The Designate argued, because this is a means of egress, the narrow landings and stairways pose a real problem and may jeopardize the safety of the occupants of the subject units. This access point, being the front door to the dwelling, he submitted, is the most frequently used entrance/exit and is logically the route for safety first thought of in an emergency situation. In addition he disputed the Applicant's claim with respect to the number of available egress routes. He argued that one may not reasonably be expected to jump out of a second or third storey window and, in any event, it should not be considered as a route that would contribute to the safe evacuation of the dwelling.

In summation, the Designate argued that the stairs and landings in question are considered to be part of the required exit. In addition, the front door of the dwellings would likely be selected as the main exit by the occupants of the units in an emergency. It is important that the minimum provisions of the Building Code be complied with in this respect.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-built exterior concrete exit stairs and landings, having widths ranging from 814 mm to 850 mm, do not provide sufficiency of compliance with Articles 9.8.3.3., 9.8.4.1., 9.9.3.2. and of the Ontario Building Code at Units 9 and 10 Charleton Settlement Avenue and Units 13, 15 and 17 Rivers Edge Drive, 1400 Weston Road, Toronto, Ontario.

8. Reasons

i) The as-built stairs and landings do not meet the minimum standards set out in the Building Code, nor have any acceptable compensating measures been offered in lieu of compliance.

ii) There were, and continue to be, viable options available to the Applicant enabling him to comply with the minimum standard outlined in the OBC.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Clause 3.1.5.12.(1)(a), Sentences 3.2.2.24.(2) and 3.3.1.1.(1), and Sentence 3.3.1.4.(3) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Sasha Milenov, Architect/Principal, Sasha Milenov Architect, Toronto, Ontario, for the resolution of a dispute with Mr. Yaman Uzumeri, Chief Building Official, City of Toronto, Ontario, to determine whether the proposed partition walls and corridor configuration provide sufficiency of compliance with Sentences 3.1.5.12.(3), 3.2.2.24.(2), 3.3.1.1.(1), and 3.3.1.4.(3) of the Ontario Building Code for Unit 4, 9 Milvan Drive, Toronto, Ontario.

APPLICANT	Mr. Sasha Milenov, Architect/Principal Sasha Milenov Architect Toronto, Ontario
RESPONDENT	Mr. Yaman Uzumeri Chief Building Official City of Toronto
PANEL	Dr. Kenneth Peaker, Chair Mr. Robert De Berardis Mr. Fred Barkhouse
PLACE	Toronto, Ontario
DATE OF HEARING	November 16th, 2000
DATE OF RULING	November 16th, 2000
APPEARANCES	Mr. Sasha Milenov, Architect/Principal Sasha Milenov Architect Toronto, Ontario **The Applicant** Mr. Norm Kevilovski Plan Examiner City of Toronto, North District **Designate for the Respondent**

RULING

1. The Applicant

Mr. Sasha Milenov, Architect/Principal, Sasha Milenov Architect, Toronto, Ontario, has applied for a building permit under the Building Code Act, 1992 to construct new partition walls and corridor in an existing social club facility located at Unit 4, 9 Milvan Drive, Toronto, Ontario.

2. Description of Construction

The Applicant is proposing to remove a portion of an existing "retail" area contained within a Latin American social club (located in Unit 4 of the subject building) and construct a replacement merchant area. The subject building containing Unit 4 is described as two storeys in building height, 2,890 m^2 in building area and as having a Group A - Division 2 major occupancy. The structure is of noncombustible construction and is equipped with sprinkler and fire alarm systems.

The disputed unit, number 4, is L-shaped and 916 m^2 in area. At the narrow, or front, portion of the unit are existing stores, washrooms and offices configured around one central corridor. At the wider, rear area of the unit is a large open eating space containing cooking and dining facilities. Both of these areas are not being altered. It is the space in between them for which the new work is intended.

The new "retail" area is to have larger tenant stores and will have a single 3 m (10 ft) wide central corridor (replacing the two current corridors) linking the eating area at the rear to the existing 3 m wide corridor at the front portion which, in turn, connects to the main entrance. The proposed work will increase the area within the unit devoted to "mercantile" uses. The proposal is the latest change in the evolution of the "retail" space that originated as an area of free market stalls for the display and selling of items, which then became individual stores, and is now intended as a larger area of reconfigured stores and corridor. The Applicant, however, is not proposing a change of use.

The construction in dispute therefore involves the proposed new "retail" store units and the corridors serving them. Specifically, the Applicant is proposing to construct the partition walls between the stores to a height of 3 m (10 ft) thereby leaving a gap of 1,295 mm (4 ft, 3 in) between the top of the wall and the underside of the ceiling. The walls are to be comprised of 2 by 4 wood studs with gypsum wallboard fastened on both sides. The same construction (including height) is intended for the wall separating the stores and the corridor. These walls, however, as the store fronts, will contain a substantial glazed window area and doors that swing outward in the direction of egress. The corridor, as stated, will be 3 m (10 ft) in width and is to be a direct, straight line from the food court, through the stores, to the exit.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed partition walls and corridor configuration provide sufficiency of compliance with Sentences 3.1.5.12.(3), 3.2.2.24.(2), 3.3.1.1.(1), and 3.3.1.4.(3) of the Ontario Building Code (OBC).

Specifically, there are three main components to this dispute. The first involves Article 3.1.5.12. which describes when combustible elements may be used in partition walls within buildings required

to be of noncombustible construction (see paragraph below). Sentence (3) of OBC 3.1.5.12. is intended for sprinklered buildings. It permits combustible partition elements if the floor area is sprinklered and if the partitions are not utilized under certain conditions not applicable to the present case. The Applicant is proposing to use combustible construction, i.e., wood stud framing, for the subject partition walls in a noncombustible, sprinklered building.

It should be noted that the construction for the building in which Unit 4 is contained is governed by Article 3.2.2.24. The building qualifies under the conditions of Sentence (1) and is therefore permitted to be built according to Sentence 3.2.2.24.(2). Among other things, this provision stipulates that the building be of noncombustible construction and that the floor assemblies have one hour rated fire separations.

The second issue relates to the separation of the retail store units. As proposed, the Applicant does not intend to separate the individual stores from each other. His plan is to erect 3 m high partition walls that leave a 1.3 m gap to the ceiling. Sentence 3.3.1.1.(1) requires that suites be separated from adjoining suites by one hour fire separations. The two exceptions to Sentence (1), found in Sentences (2) and (3), are not applicable. In particular, Sentence (2) permits the fire resistance rating to be less than one hour but not less than 45 minutes if the construction requirements in Subsection 3.2.2. allow such a reduction. As shown, in the present case, however, Sentence 3.2.2.24.(2) requires one hour separations. Sentence (3), on the other hand, exempts certain occupancies from the suite to suite separation requirement. Group E - mercantile occupancies, for example, are among those excepted. Nevertheless, as indicated above, the use of the social club (A2) was not proposed to be changed to a Group E occupancy. Moreover, to qualify for this exemption the suites in question must be served by corridors at least 9 m in width, not 3 m as proposed.

The final matter pertains to the separation of proposed corridor. Sentence 3.3.1.4.(3) permits a fire separation between a corridor and a portion of the floor to be unrated if the area is sprinklered and if the corridor does not serve certain uses not applicable here. In doing so, Sentence (3) is an exemption to Sentence 3.3.1.4.(1) which mandates that all corridors shall have one hour rated separations. Article 3.3.1.4., specifically Sentence (4), goes further to permit a sprinklered floor area to waive the separation between it and a public corridor, however, the corridor must be at least 5 m in width. The Applicant's proposed corridor, at only 3 m wide, does not qualify for the exemption from a separation under Sentence (4) and is therefore subject to Sentence (3).

4. Provisions of the Ontario Building Code

Sentence 3.1.5.12. Combustible Elements in Partitions

(3) Solid lumber *partitions* not less than 38 mm (1 ½ in) thick and *partitions* that contain wood framing are permitted to be used in a *building* required to be of *noncombustible construction* provided
(a) the *floor area* containing the *partitions* is *sprinklered*, and
(b) the partitions are not
(i) located in a *care* or *detention occupancy*,
(ii) installed as enclosures for *exits* or *vertical service spaces*, or
(iii) used to satisfy the requirements of Clause 3.2.8.1.(1)(a).

Sentence 3.2.2.24. Group A, Division 2, up to 6 Storeys, Any Area, Sprinklered

(2) Except as permitted by Article 3.2.2.16., the *building* referred to in Sentence (1) shall be of *noncombustible construction*, and

(a) floor assemblies shall be *fire separations* with a *fire-resistance rating* not less than 1 h,
(b) *mezzanines* shall have a *fire-resistance rating* not less than 1 h, and
(c) all *loadbearing* walls, columns and arches shall have a *fire-resistance rating* not less than that required for the supported assembly.

Sentence 3.3.1.1. Separation of Suites

(1) Except as permitted by Sentences (2) and (3), each *suite* in other than *business and personal services occupancies* shall be separated from adjoining *suites* by a *fire separation* having a *fire-resistance rating* not less than 1 h. (See also Subsection 3.3.3. for *care or detention occupancies*, Article 3.3.4.2. for *residential occupancies* and Article 3.1.8.7. for *fire dampers*.)

Sentence 3.3.1.4. Public Corridor Separations

(3) If a *floor area* is *sprinklered*, no *fire-resistance rating* is required for a *fire separation* between a *public corridor* and the remainder of the *floor area* provided the corridor does not serve a *care or detention occupancy* or a *residential occupancy*. (See A-3.1.8.1.(1)(b) in Appendix A.)

5. Applicant's Position

The Applicant commenced his discussion by providing a background of the building, Unit 4 and its various work undertaken over the years. He explained that the previous renovation, with the many small stores, the double corridors and ornamental wood trim was intended to achieve a Mexican look. He submitted that the current proposal is simply an improvement to the existing concept previously approved by the building department.

The Applicant stated that the unit under dispute was originally approved as a social club for a Latin-American community group which was to be used only by its members. He noted that the occupancy and restricted usage of the building will remain. The proposed changes are internal and limited to enlargement of existing retail units and combination of two existing corridor to create a larger one.

The Applicant continued that with proposed construction all combustible materials used for the Mexican-style decorations of the ceiling and elsewhere was being removed. This alteration decreases the fire load of the building to a large extent. In addition, instead of open stalls there will now be larger suites with outward swinging doors oriented perpendicularly to one wider corridor. As he noted, all of the above construction does not bring about any substantial nor structural change.

In conclusion, the Applicant requested that because the building is entirely sprinklered and equipped with a fire alarm system that they be permitted to proceed with their proposal.

6. Respondent's Position

The Respondent submitted that the retail units under dispute meet the criteria associated with suites under the Code, therefore, they should comply with the construction requirements set out for suites

under the Ontario Building Code.

The Respondent argued that as the proposed corridor is only 3 metre wide, the retail suites are required to be separated from the corridor by a rated fire separation. In addition, he stated that under the Code, fire separations are also required to be maintained between adjoining suites. However, the proposed construction does not meet any of these requirements as the intended separations are neither rated nor extend to the ceiling.

The Respondent continued that the amount of combustible materials proposed for the partitions exceeds that which is permitted in a building required to be of noncombustible construction.

The Respondent concluded by stating that if the partitions were not present, then the social club and Unit 4 would comply with the OBC.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed partition walls and corridor configuration do not provide sufficiency of compliance with Sentences 3.1.5.12.(3), 3.2.2.24.(2), 3.3.1.1.(1), and 3.3.1.4.(3) of the Ontario Building Code for Unit 4, 9 Milvan Drive, Toronto, Ontario.

8. Reasons

i) Each single-room retail unit is considered a suite. As a result, the proposed demising walls between units are considered as fire separations between suites. Accordingly, since the various relief available in the Code is not applicable, a one hour separation must be provided.

ii) Sentence 3.3.1.4.(3) waives the fire resistance rating for the proposed corridor, however, a continuous separation between the corridor and the remainder of the floor area is required since the corridor is only 3 m in width.

iii) Inadequate compensating measures were offered to achieve sufficiency of compliance with the above referenced OBC provisions.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Articles 9.8.8.8., 4.1.10.1. and Sentence 9.8.2.1.(1) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Christian Wingelaar, Waterloo, Ontario, for the resolution of a dispute with Mr. James A. Witmer, Chief Building Official, City of Kitchener, Ontario, to determine whether the proposed guard comprised mainly of 35 mm diameter acrylic rods complies with Articles 9.8.8.8. and 4.1.10.1. and whether the irregular curved stair provides sufficiency of compliance with Sentence 9.8.2.1.(1) of the Ontario Building Code at the Zinger Residence, Lot 9, 2121 Hidden Valley Crescent, Kitchener, Ontario.

APPLICANT	Mr. Christian Wingelaar, President Wingelaar Estate Homes Waterloo, Ontario
RESPONDENT	Mr. James A. Witmer Chief Building Official City of Kitchener
PANEL	Dr. Kenneth Peaker, Chair Mr. Fred Barkhouse Mr. Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	November 2, 2000
DATE OF RULING	November 2, 2000
APPEARANCES	Mr. Hans Gollek, President/Owner Wooden Stairs & Railing Ltd. Kitchener, Ontario **Agent for the Applicant** Mr. Glen D. Good Deputy Chief Building Official City of Kitchener **Designate for Respondent**

RULING

1. The Applicant

Mr. Christian Wingelaar, Waterloo, Ontario, has received a building permit under the Building Code Act, 1992 and has constructed a new detached dwelling at Lot 9, 2121 Hidden Valley Crescent, Kitchener, Ontario.

2. Description of Construction

The Applicant has recently constructed a new single detached dwelling, one storey in building height and less than 600 m^2 in building area. The building is to be used as the principal residence of the Zinger family. At the request of the owners, the stairs and guards in the subject house were custom built. The Applicant, the general contractor, contracted out the construction of the stairs and guards to a custom builder.

There are two areas of construction in dispute. The first involves the design and structural integrity of the guard serving stairs that connect the ground floor of the dwelling to the basement level. The guard is also installed on the ground floor to protect the elliptical opening for the subject stair assembly. The balusters that make up the guard are solid acrylic rods, spaced at 100 mm (4 in) on centre and are secured into the wooden handrail at the top and into each stair tread at the bottom. The acrylic rods are 35 mm (1 3/8 in) in diameter and are embedded 50 mm (2 in) into the stair and 38 mm (1 ½ in) into the railing.

The second issue at dispute involves the design of the aforementioned stair. Described as providing access to egress, the proposed 17 riser stair has a modified curved design. As part of this unique design, the stair treads do not radiate from a common point nor are the curved stringers parallel to one another throughout the stair run. In fact, as the stairs descend they become wider. The width between stringers at the top of the stairs is 1,118 mm (44 in) and at the bottom is 1,486 mm (58 ½ in). As well, the second, third and fourth lower most stairs have elliptical nosing, i.e., they are slightly bowed or outward projecting.

The minimum run of the individual stairs, ranging between 206.25 and 206.5 mm (8.12 and 8.13 in), surpasses the 150 mm (5 7/8 in) requirement. No measurements were provided for the average stairs runs, but it exceeds the minimum required of 200 mm (7 7/8 in) since even the minimum run is greater than 200 mm. The bottom stair, however, which functions more like a landing, proposes a tread depth of 813 mm (32 in) and has a semi-elliptical shape.

In terms of the uniformity of the stair run, again no measurements were provided at the average or mid-point of each tread. The Applicant, however, has noted that the proposed stair (including stairs 2, 3 and 4) has runs varying between 243 and 245 mm (9.57 to 9.59 in) at the "walking line". The walking line (see BCC Ruling # 00-12-744) is an imaginary line running throughout the stair and is measured at 300 mm (12 in) from the inside handrail. This is the line, according to the Applicant, which, from an ergonometric point of view, represents the path of the mid-point of the body that an individual would actually take to ascend or descend the stair, and not the average run (i.e., the precise middle of each stair) that the Code recognizes.

3. Dispute

The two issues at dispute between the Applicant and Respondent are i) whether the proposed guard, comprised mainly of 35 mm diameter acrylic rods, complies with Articles 9.8.8.8. and 4.1.10.1. of the

Ontario Building Code; and ii) whether and the irregular curved stair provides sufficiency of compliance with Sentence 9.8.2.1.(1) of the OBC.

Article 9.8.8.8. stipulates that all guards shall conform to the loading criteria in Article 4.1.10.1. except where guards are constructed with the requirements outlined in the Supplementary Guidelines (SG-7), in which case they are deemed to satisfy the requirements of Sentence 9.8.8.8.(1).

Article 4.1.10.1. outlines the requirements for loads on guards. Sentences (1) and (2) indicate the specifications required for the minimum horizontal load applied inward or outward at the top of every guard and for the individual elements within the guard, including solid panels and pickets.

As outlined by the Housing Development and Building Branch of the Ministry of Municipal Affairs and Housing in their memorandum dated October 12, 2000, "(w)here guards differ from the prescriptive code requirements outlined in the Supplementary Guidelines to the OBC, guards may be designed according to the Part 4 requirements to determine the loading criteria." The Branch opinion further stated that "(w)here the railing does not conform to the requirements of the SG-7 Guidelines, it shall conform to the applicable requirements of Article 4.1.10.1."

In this instance, the proposed guard that will run the length of the stair opening and the 17 riser stair, has been reviewed Truetek Engineering Inc. with respect to certain loading capabilities. At dispute however, is whether further loading calculations are required to confirm compliance with the OBC requirements.

In respect to the second area of dispute involving the design of the stair, Sentence 9.8.2.1.(1) requires that stairs have a uniform rise and run in any one flight. This requirement, which must be applied to exit and non-exit stairs alike is intended to provide consistent and uniform stair construction so that users will avoid missteps potentially resulting in injury. With the irregular curve of the stair (as noted, they do not radiate from a common point) and the elliptical shape of stairs two to four, the run has certain variations. At issue then, is whether the proposed design, with the previously described discrepancies in run uniformity, provides sufficiency of compliance with OBC Sentence 9.8.2.1.(1).

The Respondent raised concerns regarding whether the stair also failed to comply with Article 9.8.5.1. which requires that curved stairs in exits meet Article 3.4.6.8. Among other stipulations, Sentence (2) of Article 3.4.6.8. mandates that the inside radius must be "not less than twice the stair width." In doing so, this provision assumes that curved exit stairs are designed so that a line drawn at the riser face of each individual tread towards the inside of the stair would meet at a common, single point. These provisions, OBC 3.4.6.8. and 9.8.5.1., however, are applicable only to exit stairs. The present disputed stairs, as private stairs within a dwelling, are considered as access to egress stairs and not exit stairs. As a result, their failure to meet at a common radius point is not a Code violation and will therefore not be addressed.

4. Provisions of the Ontario Building Code

Article 9.8.8.8. Construction of Guards

(1) Except as permitted in Sentence (2), *guards* shall conform to the loading criteria in Article 4.1.10.1

(2) Guards constructed in accordance with the requirements in the Supplementary Guidelines shall be deemed to satisfy the requirements of Sentence 9.8.8.8.(1).

Article 4.1.10.1. Loads on Guards

(1) The minimum specified horizontal load applied inward or outward at the top of every required *guard* shall be
(a) 3.0 kN/m (200 lb/ft) for *means of egress* in grandstands, stadia, bleachers and arenas,
(b) a concentrated load of 1.0 kN (225 lb) applied at any point for access walkways to equipment platforms, contiguous stairs and similar areas where the gathering of many people is improbable, and
(c) 0.75 kN/m (50 lb/ft) or a concentrated load of 1.0 kN (225 lb) applied at any point, whichever governs, for locations other than described in Clauses (a) and (b).

(2) Individual elements within the *guard*, including solid panels and pickets, shall be designed for a concentrated load of 0.5 kN (113 lb) at any point in the element.

(3) The loads required in Sentence (2) need not be considered to act simultaneously with the loads provided for in Sentences (1) and (4).

(4) The minimum specified load applied vertically at the top of every required *guard* shall be 1.5 kN/m (100 lb/ft) and need not be considered to act simultaneously with the horizontal load provided for in Sentence (1).

Sentence 9.8.2.1.(1) Uniform Treads and Risers

(1) Treads and risers shall have uniform rise and run in any one flight.

5. <u>Applicant's Position</u>

The Agent for the Applicant submitted that, when designing a stair they always keep the Ontario Building Code requirements uppermost in their minds. Nevertheless, he argued that, in the design of this stair, the "walking line" concept measured at 300 mm (12 in) from the inside handrail was applied and therefore a consistent tread run has been provided at that distance. This "walking line" they submit, is the area determined to be the "centerline of an adult body transcending the stair, while holding on to the handrail". The only exception to this consistent stair run, he acknowledged, is the first stair which has a width of 813 mm (32 in); it has been designed more as a landing than a stair. The Agent argued that, when considering this design in the context of Article 9.8.5.2. and taking into account "a minimum variation allowed in the home construction industry, the run along the inside/right stringer and any slight alteration thereof due to the change in focal point are deemed permissible."

In respect to the rise of the stair, the Agent submitted that "the Zinger stair is 7 1/4 (in), a comfortable rise for a 17 rise staircase. In the Agent's opinion, "Article 9.8.5.2. does not state that the stair must be exactly as shown in article 9.8.5.2., nor that it must be a '90° curved stair, nor that the stair can't be flared, nor that the stair can't have elliptical treads, nor that the stair can't not have multiple focal points along the inside stringer".

In respect to the guards located along both the balcony and the stair, the Agent submitted that the "Zinger handrail design is based on previous staircases (which have been built over the last 10 years), where the handrail design has been made with the same profile, the same manufacturing techniques and the same installation techniques. There has been no record of design and/or structural failure with this design...". He emphasized that the acrylic rods have been reviewed and approved by Truetek Engineering to meet the requirements of article 4.1.10.1.. In addition, they have followed all OBC and SG-7 requirements for the stair and handrails and the connection system. In the Agent's opinion,

neither the requirements nor the intent of the Building Code are being violated.

6. Respondent's Position

The Designate for the Respondent stated that the stair designer has not considered the Ontario Building Code's prescriptive requirements in the design of this stair. He submitted that the "stair incorporates a curved section, a modified winder section (at Top & Bottom) complete with elliptical shaped nosing on the bottom three treads." The curved and winder sections do not comply with the Ontario Building Code due to the fact that the treads do not radiate from a common centre point, and /or turn through an angle of 30°; the curved stringers are not parallel to each other and therefore are neither a curved stair or a stair with winders.

The Designate argued that the stair that is the subject of this dispute is not the stair for which a permit was issued. This stair was built completely in the designers shop, without notice to the Respondent of any proposed changes. The Designate submitted that, in his opinion, when "you descend these stairs, your body naturally wants to move from the inside to the outside of the curved path of travel which results in having to negotiate a non-uniform run and tread width and a tendency for your body to move away from the handrail." This is not an appropriate design nor is it compliant with the OBC requirements. He did state however, that he has come to an agreement with the Applicant that the bottom stair can be considered as a landing.

In respect to the proposed guards, the Designate for the Respondent submitted that the design does not comply with SG-7, nor has it been reviewed for compliance with Part 4 of the OBC. While he acknowledges that this type of guard is structurally sound in respect to vertical loading, there is no confirmation that these balusters would meet the requirements for lateral loading. He indicated that he would need confirmation from a qualified engineer to satisfy his concerns in that regard.

7. Commission Ruling

It is the decision of the Building Code Commission that concerning the Zinger Residence, Lot 9, 2121 Hidden Valley Crescent, Kitchener, Ontario, the proposed guard, comprised mainly of 35 mm diameter acrylic rods complies with Articles 9.8.8.1. and 4.1.10.1. of the Ontario Building Code on the condition that:

(1) the lateral capacity of the guard is verified by a qualified engineer.

It is also the decision of the Building Code Commission that the irregular curving stair provides sufficiency of compliance with Sentence 9.8.2.1.(1) of the Ontario Building Code at the aforementioned Zinger Residence.

8. Reasons

i) With verification of the lateral capacity, the guard will comply with the Ontario Building Code.

ii) The variations related to the run of the stair are considered minimal and therefore sufficiently comply with OBC requirements.

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Article 3.1.2.1. & 3.1.3.1. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. David Climans, Principal, Climans, Green, Liang Architects, Toronto, Ontario, for the resolution of a dispute with Ms. Heather Rutherford, Chief Building Official, Town of Innisfil, Ontario, to determine whether the restaurant and fixed seat grandstand areas of the proposed new racetrack facility can be considered as sharing the same major occupancy in accordance with Articles 3.1.2.1. and 3.1.3.1. of the Ontario Building Code at the Georgian Downs Racing Centre, Innisfil, Ontario.

APPLICANT	Mr. David Climans, Principal Climans, Greens, Liang Architects Toronto, Ontario
RESPONDENT	Ms. Heather Rutherford Chief Building Official Town of Innisfil
PANEL	Dr. Kenneth Peaker, Chair Mr. Robert De Berardis Mr. Donald Pratt
PLACE	Toronto, Ontario
DATE OF HEARING	October 19, 2000
DATE OF RULING	October 19, 2000
APPEARANCES	Mr. Rick Mori, Senior Associate Leber/Rubes Inc. Toronto, Ontario **Agent for the Applicant** Ms. Heather Rutherford Chief Building Official Town of Innisfil **The Respondent**

RULING

1. The Applicant

Mr. David Climans, Principal, Climans, Green, Liang Architects, Toronto, Ontario, has received a conditional building permit under the Building Code Act, 1992 to construct a new racetrack facility known as the Georgian Downs Racing and Gaming Centre, in the Town of Innisfil, Ontario.

2. Description of Construction

The Applicant is proposing to construct a new racetrack facility in the Town of Innisfil. The structure will have a building height of three storeys, will occupy a building area of 17,622 m^2 (including the racetrack surface) and will be of noncombustible construction. The building is proposed to be equipped with sprinkler and fire alarm systems.

The facility will contain an enclosed grandstand and a stepped restaurant with a gaming centre. The restaurant and the grandstand areas are located next to one another and have been designed as viewing areas overlooking the racetrack. Both areas face the open air racetrack to the east, and both are totally enclosed and separated from the racetrack by a glass curtain wall. The restaurant will occupy an area of 579 m^2 and will consist of six stepped levels with one row of tables at each level. Each of the 106 tables will accommodate a maximum of four seats resulting in a total of 424 seats in the restaurant. There will also be a stepped gaming centre that will accommodate slot machines within the restaurant area. The grandstand will occupy an area of 779 m^2 and will have 11 rows of fixed seating with an occupant load of 550.

The construction in dispute involves the differentiation of the two uses and the separation between the grandstand and the restaurant areas. It is proposed that the restaurant and grandstand be considered as sharing the same major occupancy classification and that a plain glass partition will separate the areas from one another.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the restaurant, including gaming centre and fixed seat grandstand area of the new racetrack facility can be considered as sharing the same major occupancy in accordance with Articles 3.1.2.1. and 3.1.3.1. of the Ontario Building Code (OBC).

Article 3.1.2.1. classifies buildings according to their major occupancy, that is "the principal occupancy for which a building or part thereof is used or intended to be used". Sentence (1) of this Article classifies the major occupancies regulated under the Code (these occupancies are listed in Table 3.1.2.1. which forms part of Sentence 3.1.2.1.(1)). In addition to the occupancy classifications, examples of each occupancy are provided in Appendix A to the 1997 Ontario Building Code. According to the examples listed in Appendix A, a grandstand qualifies as an Assembly occupancy, Division 4, while a restaurant is categorized as an A2 occupancy. It should be noted, however, that the Appendix also defines an A4 occupancy as one where the occupants are gathered in the open air. Further, Sentence (2) of Article 3.1.2.1. stipulates that if a building is intended to have more than one major occupancy, its classification must include all of those occupancies.

In addition, according to Sentence 3.1.3.1.(1), in a building with more than one major occupancy,

adjoining major occupancies must be separated by fire separations having a fire-resistance rating conforming to Table 3.1.3.1. As applied to the present case, if the restaurant and the subject grandstand are defined as having different assembly occupancies, a fire separation with a fire-resistance rating of one hour is required to be maintained between the two areas.

4. Provisions of the Ontario Building Code

Article 3.1.2.1. Classification of Buildings

(1) Except as permitted by Articles 3.1.2.3. to 3.1.2.6., every *building* or part thereof shall be classified according to its *major occupancy* as belonging to one of the Groups or Divisions described in Table 3.1.2.1. (See Appendix A.)

(2) A *building* intended for use by more than one *major occupancy* shall be classified according to all *major occupancies* for which it is used or intended to be used.

Article 3.1.3.1. Separation of Major Occupancies

(1) Except as permitted by Sentences (2) and (3), *major occupancies* shall be separated from adjoining *major occupancies* by *fire separations* having *fire-resistance ratings* conforming to Table 3.1.3.1.

5. Applicant's Position

The Agent for the Applicant submitted that, regardless of the different major occupancy classification that could be attributed to the restaurant and the grandstand under dispute, there is no need for a fire separation between them because of proposed fire safety measures incorporated into the design of the structure.

The Agent argued that the OBC regulates the life safety and building construction requirements of a building based on the major occupancies for which the building is intended to be used. Functionally, both the proposed grandstand and restaurant have been designed for the same purpose, that is to view the races. As a result, they should be classified under the same occupancy.

The Agent continued by stating that the purpose of the requirement for a fire separation between major occupancies is to prevent the spread of fire from a more hazardous occupancy to a less hazardous adjoining occupancy. By providing the same function of use, neither the grandstand nor the restaurant pose a greater risk or hazard to the occupants of the other area. In fact, they can be considered as a subsidiary occupancy to one another. For example, the Agent argued, when there is no race, the grandstand can be used as a waiting area for the restaurant.

The Agent stated that there are eighteen other racetracks in Ontario, in addition to other facilities such as Skydome and Air Canada Centre, where a restaurant operates within a large sporting or public assembly facility without any fire separation between the fixed seating area and restaurant use.

The Agent concluded by advising that it is his position that both the restaurant and the grandstand have an A2 occupancy and that no fire separation is required between the two areas. He went on to state

that, even if they are considered as having different occupancies, the requirement for a rated fire separation can be waived because both areas are fully sprinklered and have exits totally independent from one another. Therefore, he submitted, no hazard is posed to either area from the adjacent occupancy.

6. Respondent's Position

The Respondent submitted that it is her position that the proposed grandstand has a Group A, Division 3 Assembly occupancy and, therefore, must be separated from the restaurant by a one-hour rated fire separation as required by the Ontario Building Code. The Respondent explained that she reached this conclusion, even though in her view the grandstand under dispute does not fit the precise definition of either the A3 or A2 occupancy classifications. She submitted that in " the classification of the Grandstand as such...(i)t appears that both of the classifications can be considered since the actual guidance comes from the Appendix of the Ontario Building Code which is just that, guidance, not regulatory."

Nevertheless, she indicated that she has taken a conservative approach to the question of how to review the Code compliance issues related to the proposed construction. The Town's responsibility, she stated, is to the safety of the "would be occupants" and, in this regard, a cautious stand has been taken.

7. Commission Ruling

It is the decision of the Building Code Commission that the intended restaurant/gaming space and fixed seating grandstand area of the proposed new racetrack facility, with no fire separation to be provided between, complies with Articles 3.1.2.1. and 3.1.3.1. of the Ontario Building Code at the Georgian Downs Racing and Gaming Centre, Innisfil, Ontario.

8. Reasons

i) The Commission views that both the restaurant/gaming and grandstand areas as being included within the A2 occupancy classification of the OBC.

ii) The Commission is also satisfied that the proposed fire safety measures provided in the different portions of the building are adequate:

a) The building is fully sprinklered;

b) A glass smoke separation has been provided between the two principal areas; and,

c) Adequate and sufficient independent exits exist for both the restaurant and grandstand portions.

APPEARANCES
Mr. David Burstein, Owner
Markham. Ontario

The Applicant

Mr. Tony Boyko, Manager and Mr. Joe Holley, Building Inspector
Building Inspections
Town of Markham
Designates for the Respondent

RULING

1. The Applicant

Mr. David Burstein and Mina Battaglino, Owners, 16 Steele Valley Road, Thornhill, Ontario, have received an order to comply under the Building Code Act, 1992 to remedy certain alleged deficiencies regarding the design of a guard at 16 Steele Valley Road, Markham, Ontario.

2. Description of Construction

The Applicant has recently completed a renovation of his existing dwelling and as well has constructed an addition thereto. The building is described as a two storey, Group C - residential occupancy with a building area of approximately 300 m^2.

The construction in dispute involves the as-constructed guards that have been installed in a stair that provides access between the basement, ground and second floor levels. The guard is comprised mainly of curving metal members designed in an ornamental floral pattern. The metal members predominantly run vertically, however, most also contain a loop as part of the pattern. Supporting these members at the bottom of the guard are two parallel horizontal (except on the stairs) metal rails fixed approximately 100 and 200 mm above the walking surface. The guard is topped with wood handrails that are fastened to either newel posts or walls and that sit directly on top of the looping portion of the metal members.

Besides being located directly on either side of the flights within the stair, the subject guard has also been installed in other areas within the stairwell. This includes at the second floor to separate a corridor/hallway from the stairwell and at the landing between the first and second floors to separate the stair from a bay window.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the as-built guards, comprised mainly of an ornamental floral design, provide sufficiency of compliance with Article 9.8.8.5. of the Ontario Building Code at 16 Steele Valley Road, Markham, Ontario.

This provision stipulates that required guards must be designed in such a way so as not to facilitate climbing between 100 and 900 mm above the floor or walking surface of the area the guard is protecting. The issue at dispute is whether the guards, as designed and constructed, facilitate climbing.

4. Provisions of the Ontario Building Code

Article 9.8.8.5. Design to Prevent Climbing

1. Guards required by Article 9.8.8.1. and serving buildings of residential occupancy shall be designed so that no member, attachment or opening located between 100 mm (4 in) and 900 mm (2 ft 11 in) above the floor or walking surface protected by the guard will facilitate climbing.

5. Applicant's Position

The Applicant submitted that he takes pride in his house, and because of this he and his family were interested in a more decorative guard for their stairs. As a result, the ornamental floral design was chosen. However, in doing so he would never put the safety of his family at risk. He argued that the subject guards are neither climbable nor hazardous. In his view, they meet the intent of the guard requirements of the Building Code in that they assist persons in getting up and down the stairs and prevent them from falling over the side at any point in the stairwell.

He noted, nevertheless, that it is impossible to regulate one hundred per cent safety. Users of stairs have to take responsibility for how they use them. And in the case of children who might not be fully aware of the potential dangers, their parents have the responsibility of looking out for them.

The Applicant explained that he has seen numerous other homes in the Toronto area that have had these and other similar types of guards installed. He indicated that there are various manufacturers selling such products throughout the Toronto market. To illustrate his argument, the Applicant showed an article from a magazine and pictures from homes he

recently visited, all of which contained ornamental metal guards employing a floral pattern. If such products are being sold and installed so widely, how is it possible they do not meet Code, he inquired.

Moreover, the Applicant expressed frustration that standards found in the Ontario Building Code were not being applied and enforced equally across the province and even within his own municipality. He argued that one standard should be applicable to the whole of Ontario. But in this case, he felt like he was being singled out.

In summation, the Applicant stated that inspections conducted earlier in the project should have identified this issue. Further, the extent of the problem was not made known to him until the guards were fully built. He indicated that the option of installing plexiglass on the inner side of the guard did not appeal to him. And besides, he felt it to be unnecessary. He concluded by stating he is very satisfied with the safety of the guards and by reiterating that people have a responsibility for their actions, including using stairs safely.

6. Respondent's Position

The Respondent submitted that the as-built guards contain members between the height of 100 to 900 mm above the walking surface that are climabable, and as a result are not in compliance with Article 9.8.8.5. They noted that, in their estimation, some of the ornamental metal members are curved to such an extent that a ladder effect is created. As well, the upper of the two horizontal rails near the bottom of the guard is well within the 100 to 900 mm range. This rail, at approximately 800 mm above the walking surface, is a tempting step in terms of climbing the guard, they argued.

The Respondent rejected the Applicant's claim that the level of service regarding inspections was inadequate.

The Respondent concluded by stating that things in magazines are not always Code compliant and that they cannot speak to the issue of Code enforcement in other municipalities. They noted that the subject hearing concerned the guards at the Applicant's house, which they believe do not meet Code. As such, they stand by the Order issued. In their view the guard is climbable.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-built guards comprised mainly of an ornamental floral design do not provide sufficiency of compliance with Article 9.8.8.5. of the Ontario Building Code at 16 Steele Valley Road, Markham, Ontario.

8. Reasons

i. We hold that the guard, as constructed, with its ornamental, looping floral pattern is considered to facilitate climbing, and as a result does not comply with Sentence 9.8.8.5.(1).
ii. No compensating measures were provided to mitigate the climbable nature of the guard's design.

Agent for the Applicant

Mr. Frank Spagnolo,
Manager, Building Engineering and Inspections
City of Mississauga
Designate for the Respondent

RULING

1. The Applicant

Mr. D.J. Thomas Dutton, Vice President, The Daniels Corporation, Toronto, Ontario, has applied for a building permit under the Building Code Act, 1992 to construct a retirement community centre known as the "Kimbermount Village" at the Renaissance in Erin Mills, 4620 and 4680 Kimbermount Avenue, Mississauga, Ontario.

2. Description of Construction

The The Applicant is proposing to construct a new retirement complex known as "Kimbermount Village". The building complex is to consist of two towers referred to as building A and Building B, which are to be connected at the ground floor level. The ground floor of the complex will contain dining facilities and other amenities and will be classified as Group A, Division 2 - Assembly occupancy. Building A is intended as a retirement home tower and is to be seven storeys in building height and will accommodate a Group B, Division 3 - Care Occupancy on its second floor. The remaining floors (three to seven) of this building will contain a Group C - Residential occupancy. The B3 floor is to have 24 hour supervision.

Building B is intended as a condominium apartment tower and is to be eight storeys in building height and is classified as a residential occupancy from its second to eighth floors. The entire building will also have one level

of underground parking. The complex is to have a building area of approximately 2636 m2, will be of noncombustible construction, and will be equipped with a sprinkler system, a fire alarm system, and a standpipe and hose system.

The construction in dispute involves the installation of a linen chute.

The subject linen chute is proposed to be located in the central portion of Building A. It will extend from the basement level to the second floor level only, where the chute will be housed within a dedicated room. The walls of the anteroom have a fire resistance rating of 45 minutes and the door to the room is also fire rated and is to be equipped with a closer as well as weatherstripped. The chute itself, measured at 600 mm in diameter, will have a two hour rating and is to be installed with a self-closing, two hour door equipped with a latching device. The chute will also be sprinklered with quick response heads.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the linen chute, which is proposed to extend from the basement to the second floor only and not up and through the roof, provides sufficiency of compliance with Sentence 3.6.3.3.(3) of the Ontario Building Code. This provision requires a linen chute installed within a building to extend at least one metre above the building's roof and to be appropriately vented above the roof.

As noted, the linen chute will only extend between the basement and second floor and will not be vented. The Applicant has, however, proposed certain compensating measures. At issue, therefore, is whether these proposed measures, offered in lieu of the linen chute extending through the roof of the subject building, provide adequate compensation to achieve sufficiency of compliance with Sentence 3.6.3.3.(3).

4. Provisions of the Ontario Building Code

Article 3.6.3.3. Linen and Refuse Chutes

(3) An interior linen chute or refuse chute shall extend not less than 1 000 mm (3 ft 3 in) above the roof and shall be vented above the roof with a vent which

a. has an unobstructed area not less than the cross-sectional area of the chute, and

b. is equipped with a cover that will open automatically, or that can be opened manually, in the event of a fire in the chute.

5. Applicant's Position

The Agent for the Applicant acknowledged that the proposed chute design represented a "literal transgression" of the Code, but he submitted that the proposed fire safety measures for the entire building will provide sufficiency of compliance with the intent of the OBC for the purpose of Sentence 3.6.3.3.(3). In support of his submission the Agent offered the following compensating factors:

1. The shaft containing the linen chute will be provided with a 2 h rating while 1 h rating is required by the OBC (Sentence 3.6.3.3.(2));
2. The chute will have a self-latching closure with a 2 h rating;
3. The entire building will be protected by an electrically supervised sprinkler system with a connection to the fire department;
4. Quick response sprinklers will be installed within the chute and in the basement;
5. The linen chute anteroom on the second floor will be provided with a smoke detector;
6. The door between the second floor corridor and the linen chute anteroom will be weatherstripped on the top and sides with a high quality weatherstripping material and the bottom of the door will be provided with a sweep; and,
7. Both the elevator shaft and exit stair shafts will be pressurized to prevent smoke infiltration.

The Agent noted that the requirement for a linen chute to extend above a building's roof was developed in a time when most of buildings were not sprinklered and thus there was greater chance of a fire propagating than would

be the case in a sprinklered building, such as the one in dispute. He indicated that Code requirements for linen and refuse chutes, especially to extend through the roof, have not evolved much over the years despite the many advances in the fire safety of buildings.

The Agent also argued that the requirement for linen chutes to extend to the roof of buildings and to be equipped with automatically opening vents would seem to make more sense in a building with multi-storey access to a chute. In this way, he argued, such venting could help prevent smoke from a fire originating in the chute from migrating to many levels of a building. In the subject building, however, with only one floor level with access to the chute, it seems that the requirement to vent to the roof is onerous, especially considering the proposed compensating measures such as additional sprinklering that exceeds Code requirements.

With respect to the Commission's concern over the potential occurrence of linen blockage within the chute, the Agent offered to widen the size of the chute from 600 mm (24 in) in diameter to 750 mm (30 in) part way down during descent.

In conclusion, the Agent indicated that the proposals discussed above provide sufficiency of compliance with the intended level of fire and life safety required under Sentence 3.6.3.3.(3).

6. Respondent's Position

The Designate for the Respondent submitted that the proposed linen chute does not comply with Sentence 3.6.3.3.(3) of the OBC.

The Designate argued that the OBC requirement for a chute to extend above a building's roof is a prescriptive requirement that must be met. The OBC clearly states that a linen chute must extend not less than 1 m above the roof and be vented with a vent equipped with a cover that can be opened automatically or manually in the event of a fire.

In addition, the Designate stated that he was concerned about the fact that the linen chute will terminate on the second floor, the level that contains the B3 occupancy. This is the area where the most vulnerable residents of the building are located and should the smoke from the chute penetrate to this floor a hazardous situation could be created, he argued.

7. Commission Ruling

It is the decision of the Building Code Commission that the linen chute, which is proposed to extend from the basement to the second floor only and not up and through the roof, provides sufficiency of compliance with Sentence 3.6.3.3.(3) of the Ontario Building Code at the Renaissance in Erin Mills, 4620 and 4680 Kimbermount Avenue, Mississauga, Ontario.

8. Reasons

The overall level of safety in the building has been improved through the following factors:

1. The proposed linen chute will only connect two floors and that there will be only one opening on a floor area (the second floor) in which people live;
2. The sprinklers provided inside the chute will be more than required by Code;
3. The chute, including door, will have a two hour fire rating instead of one hour;
4. The laundry chute door will be self-closing and equipped with a latching device;
5. The chute will be increased in diameter from 600 mm (24 in) to 750 mm (30 in) part way through its descent to avoid blockage;
6. The anteroom will be provided with a smoke detector and a door with a closer; and,
7. The elevator shafts and corridors will be pressurized.

Dated at Toronto this **21st,** day in the month of **September** in the year **2000** for application number **2000-55**.

The Respondent

RULING

1. The Applicant

Mr. John Cardillo, CEO, Premier Fitness Club, Oakville, Ontario, has applied for a building permit under the Building Code Act, 1992 to renovate and extend an existing private health and fitness club known as the Premier Fitness Club, 474 Iroquois Shore Road, Oakville, Ontario.

2. Description of Construction

The The Applicant is proposing to extend and renovate an existing building which serves as a private health and fitness club in order to expand its fitness activities and add a new indoor swimming pool. The existing building is described as having a Group D - Business and Personal Services occupancy by the Applicant and a Group A, Division 2 - Assembly occupancy by the Respondent. The existing building is two storeys in building height, 2184 m2 in building area, of noncombustible construction, and is equipped with a fire alarm system.

The subject building was constructed in 1977. The current proposal, as submitted for building permit, includes renovation of the existing building and construction of two new additions. The additions will be at the south (rear) and west sides of the first floor. The rear addition will cover an area of 253 m2,

whereas the side addition will have an area of 304 m2. With these additions, the building area of the entire building will be increased to 2741 m2. Both additions are one storey in building height.

?The construction in dispute involves the classification of the entire building.

The performance level of the exiting building is proposed to be maintained by the Applicant by limiting the increase in occupant load of the entire building to less than 15 percent of the current load and by retaining the current major occupancy. As a result, he is intending that only the proposed additions are subject to requirements of Part 3, and thereby only they should be sprinklered.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether, due to the consideration of the building as an existing structure and the proposed construction of two additions, the classification of the entire structure as per Article 3.1.2.1. of the Ontario Building Code is changed from a Group A, Division 2 to a Group D occupancy.

Article 3.1.2.1. requires, with a few exceptions which are not applicable here, that every building be classified according to its major occupancy or occupancies (Sentences (1) and (2) respectively) as set out in Table 3.1.2.1. This Article also refers to Appendix A of the OBC where various examples of building uses and their classifications can be found. In the Appendix, gymnasia are listed under the category of A2, not Group D occupancies. Appendix 3.1.2.1. does not refer to anything that may be construed as a gym, health club or fitness facility. Under Part 11 for existing buildings, however, specifically the Hazard Index Table 11.2.1.1.J., "Health/Fitness Clubs" are listed as Group D occupancies. (Part 11 is applicable since the existing structure is older than five years.)

The Applicant is not proposing to change the major occupancy of the building. Instead, he insists that it is already changed, or that the building, by virtue of being an existing structure, can be considered as a Group D occupancy.

At issue therefore is whether the classification of the building, because it is now considered existing, has changed from an A2 occupancy to a D and whether the proposed additions, one of which includes a pool, also have an impact on the major occupancy/ies.

4. Provisions of the Ontario Building Code

Article 3.1.2.1. Classification of Buildings

1. Except as permitted by Articles 3.1.2.3. to 3.1.2.6., every building or part thereof shall be classified according to its major occupancy as belonging to one of the Groups or Divisions described in Table 3.1.2.1. (See Appendix A).
2. A building intended for use by more than one major occupancy shall be classified according to all major occupancies for which it is used or intended to be used.

5. Applicant's Position

The Agent for the Applicant submitted that the major occupancy of the building, after renovation and extension, will remain the same, that is to say a D occupancy. In addition, the occupant load of the completed building will not be increased by more than 15 percent. As a result, a D occupancy should be applied to the entire building.

By way of explanation, the Agent argued that the building in dispute is existing and subject to the requirements of Part 11. Under Part 11, a fitness club is classified as a Group D occupancy in Table 11.2.1.1.A. As no change of occupancy is proposed, this classification also applies to the new addition at the rear of the building which is to be used as a work out area.

The Agent continued that despite the fact an indoor swimming pool is listed as an example of Group A, Division 3 - Assembly occupancy in the Appendix A to the OBC, the proposed swimming pool will only occupy 304 m2 of the entire 2741 m2 building, so it can be considered as an integral part of the principal occupancy and thus subsidiary to it as per Article 1.1.3.1.

The Agent then argued that the classification of a fitness club as an A2 or D occupancy does not make much difference in new buildings as the construction requirements are almost the same for both of these occupancies under Part 3. However, under Part 11 these requirements are different and impose higher standards on assembly than Group D occupancies. The reason for this is that under Part 11, unlike Group D buildings such as a fitness club, A2 buildings are often regularly frequented and are more likely to have areas with dimmer lighting such as restaurants and movie theatres.

The Agent concluded that based on the entire building remaining as a Group D occupancy and that the performance level of the existing building will be maintained, the following measures are proposed: Sprinklering the rear addition of the building; Sprinklering the swimming pool area; and, separating the indoor pool area from the remainder of the building by a fire separation having a 2 hour fire resistence rating including doors with a 1.5 hour rating.

6. Respondent's Position

The Respondent submitted that the major occupancy of the existing building has always been and remains A2. Moreover, he stated that the performance level of the structure is reduced because the proposed addition along the west side of the building eliminates the designated fire access route created by municipal zoning by-law. A performance level reduction of this nature, he added, does not have a specific remedy in terms of compensating construction in Part 11. As a result, he argued that the entire

building should be viewed as falling under Part 3 and thus the sprinkler system required in the additions should be extended throughout the whole facility.

The Respondent rejected the Agent's arguments that simply because a building is now older than five years and is considered existing means that its occupancy has changed. He stated that a building is classified for occupancy when constructed and a change of use is required to amend that occupancy. He argued that Part 11 cannot be used as a vehicle to change occupancy.

Municipal Fire Department officials that attended the hearing also reiterated the view that the performance level would be reduced since the proposed side addition would cut off fire fighting access on the building's western exposure. They also noted that the existing fire hydrants in the vicinity are located on the far side of the adjacent public street.

The Respondent concluded by stating that the elimination of the fire route reduces the performance level of the subject building. For this reason, the entire building must comply with the requirements of Part 3 rather than Part 11, meaning therefore that the existing building is required to be sprinklered as well as the additions.

7. Commission Ruling

It is the decision of the Building Code Commission that both the existing fitness club and proposed additions thereto constitute an A2 occupancy in accordance with Article 3.1.2.1 of the Ontario Building Code at the Premier Fitness Club, 474 Iroquois Shore Road, Oakville, Ontario.

8. Reasons

1. Considering its use is similar to a gymnasium, the existing building was originally and properly classified as an A2 occupancy.

2. The definition of an A2 occupancy is determined on the basis of the list of uses included in Appendix "A", which includes gymnasia.
3. The swimming pool is considered as an ancillary use and does not affect the major occupancy.

RULING

1. The Applicant

Ms. Cathy Wood, Executive Director, Ottawa-Carleton Lifeskills Inc. (OCLS), Nepean, Ontario, has received a building permit under the Building Code Act, 1992 for the renovation and conversion of a residential building into a care facility at 3041 Otterson Drive, Ottawa, Ontario.

2. Description of Construction

The Applicant has recently renovated a Group C, residential building (formerly a house) to facilitate its conversion to a Group B, Division 3 - Care occupancy. The structure is described as one storey in building height (with a basement) and has a building area of 419 m2. It is constructed of combustible material, is fully sprinklered and is equipped with a residential smoke detection system with multiple interconnected smoke detectors and multiple alarm broadcast.

It is intended that the building will house eight individuals with special needs, specifically persons whom are likely to be significantly disabled, both physically and mentally. The residents will, therefore, require assistance for most daily activities. The facility will be staffed 24 hours a day with three staff

members in attendance from 7 a.m. to 11 p.m. and two in attendance from 11 p.m. to 7 a.m. These staff members will continually be available to provide assistance to the residents of the care facility.

The areas of construction in dispute involve the width of corridors throughout the building and the width of the doors serving bedrooms two and three. Also in dispute is the width of a newly constructed access ramp to the main entrance of the facility and the door at the main entrance which does not provide a power operating device. In addition, the non-rated wall between bedrooms two and three is also at issue.

There are a total of three corridors in the building that provide access to common areas such as the kitchen and dining room. All of the corridors are 1321 mm in width and also provide access to the five bedrooms and two exit doors. There is one exit door at the main entrance, located in the front of the building, and another one leading to the side yard. In addition, there is a newly built, 1346 mm wide, wheelchair ramp leading to the main entrance door. The door to this entrance is not a power operated door. The existing doorways serving bedrooms two and three are 915 mm wide and the wall dividing these bedrooms is composed of 13 mm gypsum wallboard on wood studs and is not rated. There are however side mounted sprinkler heads built into this wall.

With the exception of the newly constructed ramp to the entrance door, all of the items in dispute existed within the residential building prior to the conversion of use.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed renovation and conversion of an existing, detached building containing a Group C occupancy to a Group B, Division 3 care facility is required to comply with Sentences 3.3.3.3.(3) and 3.3.3.4.(1), Clauses 3.4.3.1.(2)(d), (c) and 3.8.3.3.(5)(b) and Sentence 3.3.3.2.(2) of the Ontario Building Code.

The first provision, Sentence 3.3.3.3.(3), requires that the corridors in a building containing a Group B, Division 2 or 3 occupancy be at least 1650 mm wide if the residents are not mobile. Many of the residents to be housed in the proposed care facility are completely immobile. However, all of the existing corridors serving the subject building are 1321 mm wide.

Sentence 3.3.3.4.(1), with few exceptions not applicable here, mandates that the doorways serving the patients or residents of care or detention occupancies must have a minimum width of 1050 mm. The existing doorways to bedrooms two and three are 915 mm wide. There are to be two residents in each room and it is intended that they would be carried or assisted out of the rooms by staff in an emergency situation.

Sentence 3.4.3.1.(2)(d) is a further requirement that reinforces Sentence 3.3.3.4.(1) above by stipulating that doorways serving patient or resident sleeping rooms be a minimum of 1050 mm in width. As noted above, the two bedrooms in question have doorway widths of 915 mm.

Sentence 3.4.3.1.(2)(c) requires ramps and stairs serving patient or resident sleeping rooms in a Group B, Division 3 occupancy to have a minimum width of 1650 mm. The newly built ramp at the main entrance is 1346 mm wide.

According to Clause 3.8.3.3.(5)(b), with one exception not applicable here, doors for barrier-free entrances to Group B, Division 2 or 3 occupancies are required to be opened automatically, i.e., to be equipped with a power operating device. The main entrance to the subject building will meet barrier-free requirements in terms of width, but it will not be equipped with a power door operator.

Sentence 3.3.3.2.(2) stipulates that a fire separation with a minimum fire-resistance rating of one hour be maintained between sleeping rooms and other adjacent rooms unless the floor assemblies are required to have a fire-resistance rating of 45 minutes. In this case, the walls can also have the same rating (45 min). The wall existing between bedrooms two and three is not a rated wall.

The building, however, is an existing structure, older than five years. Part 11 of the OBC is therefore applicable. At issue then is whether Part 11 dictates that the construction undertaken at the facility should be subject to the above provisions from other parts of the Code (outside of Part 11).

4. Provisions of the Ontario Building Code

Sentence 3.3.3.2. Fire Separation

(2) In a Group B, Division 3 occupancy, walls between sleeping rooms and adjacent rooms shall be constructed as fire separations having a fire-resistance rating not less than 1 h, except that the fire-resistance rating need not be more than 45 min where the floor assembly is not required to be more than 45 min.

Sentence 3.3.3.3. Corridors

(3) A corridor serving residents who are not ambulatory in a Group B, Division 2 or 3 occupancy shall be not less than 1650 mm (5 ft 5 in) wide.

Sentence 3.3.3.4. Doorway Width

(1) Except as permitted in Sentence 3.3.1.12.(11), the minimum clear width of doorways serving patients or residents shall be 1 050 mm (3 ft 5 in).
(See Appendix A.)

Clauses 3.4.3.1. Exit Width

(2) The required width of an exit shall be not less than

(c) 1650 mm (5 ft 5 in) for stairs and ramps serving patients' or residents' sleeping rooms in a Group B, Division 2 or 3 Occupancy,

(d) 1050 mm (3 ft 5 in) for doorways serving patients' or residents' sleeping rooms.

Clause 3.8.3.3. Doorways and Doors

(5) Except as permitted in Sentence (7), the door for the entrance described in Article 3.8.1.2. shall be equipped with a power door operator in

(b) buildings of Group B, Division 2 or 3 major occupancies.

(See Appendix A.)

5. Applicant's Position

The Agent for the Applicant submitted that Ottawa-Carleton Lifeskills provides housing for developmentally challenged clients. While he indicated his belief that the house is subject to OBC Part 11, he stated that they had made every effort in their renovation to comply with Part 3 of the Code, specifically the construction requirements of Article 3.2.2.41. Several Code requirements though were not implemented due to structural or construction difficulties.

In addressing the perceived deficiency in corridor width, the Agent advised that it would be expensive and unnecessary to move the existing walls. The width of the corridors, at 1321 mm, is adequate for the occupants of the care facility. Similarly, the existing doorways of bedrooms two and three are located within load bearing walls and would therefore be difficult to widen. As they exist, the Agent argued, they provide sufficient access to the bedrooms by the occupants and staff. Moreover, the separation between the two bedrooms is satisfactory given the additional fire safety provided by the sprinkler heads installed in this wall.

Regarding the width of the ramp to the entrance door, even though it is new construction, the Agent saw no benefit to making it wider than the doorway opening. The ramp, although slightly narrower than required, as well as the existing doorway to the main entrance can be used by persons in wheelchairs and would therefore meet the needs of both occupants and visitors to the facility. In addition, the Agent argued, because the residents require assistance to move about, a staff member must always be present whenever a resident uses the main entrance door, thereby negating the need for a power door operator.

In conclusion, the Agent contended that since the building is covered by Part 11, compliance with the disputed OBC requirements is not necessary. Moreover, with the 24 hour presence of staff in the facility to offer assistance to residents and visitors, as needed, in addition to the fire safety measures provided, the subject facility will not only be safe, but easy and convenient for its occupants and visitors to use.

6. Respondent's Position

The Respondent submitted that as a result of this conversion of major occupancy, the performance level of the building is reduced. While he may be sympathetic to the arguments of the Applicant, he has no authority to accept the proposals put forth. Even though the corridors and doors may be wider than usual in existing buildings, they do not meet the 1997 Ontario Building Code requirements for a Group B, Division C Care facility.

7. Commission Ruling

It is the decision of the Building Code Commission that at the recently renovated B3 occupancy located at 3041 Otterson Drive, Ottawa, Ontario:

a. The fire separation for sleeping rooms and adjacent rooms outlined in Sentence 3.3.3.2.(2) is not required;
b. Compliance is not required with Sentence 3.3.3.3.(3) concerning corridor width;
c. Compliance is not required with Sentence 3.3.3.4.(1) regarding doorway width;
d. The front door is not required to comply with Clause 3.8.3.3.(5)(b) as the door/entrance was not modified; and,
e. The ramp width is required to comply with Clause 3.4.3.1.(2)(c) of the Code.

8. Reasons

i. The building is an existing structure that has undergone a change of use and conversion from Group C to B3. As a result, Part 11 of the OBC is applicable.

ii. The compensating measures proposed by the Applicant are sufficient to ensure that life safety is not jeopardized in this instance

iii. The performance level of the building is therefore satisfactorily addressed.

iv. As the access ramp is a newly constructed feature added to the facility, it is required to comply with the current Code provisions.

APPEARANCES	Mr. Bill Mardiame, President York Health Care Development Thornhill, Ontario **Agent for the Applicant** Mr. Morris Lucchetta Manager of Inspections Town of Richmond Hill **Designate for the Respondent**

RULING

1. The Applicant

Mr. Mike Godawa, Principal, Keen Engineering Co. Ltd., Toronto, Ontario, has received a building permit under the Building Code Act, 1992 and has constructed a continuing care facility known as the York Central Hospital - Long Term Care Centre, at 10 Trench Street, Richmond Hill, Ontario.

2. Description of Construction

The Applicant has constructed a new 5 storey continuing care centre that is attached to the York Central Hospital. The long-term care facility has a building area of 3,530 m^2 and is classified as a Group B, Division 2 occupancy. It is equipped with a fire alarm system, a sprinkler system and a standpipe and hose system. The building is constructed of noncombustible construction.

A typical floor plate in the facility consists of a central or core area from which project three wings. A one hour fire separation is located between the central area and each of the three wings. The central area houses nursing stations which are surrounded by staff and community offices and patient lounges, etc. The three wings consist primarily of patient, or resident, rooms. All of the resident rooms have been designed with an independent heating, ventilating and air-conditioning (HVAC) system, while the central core and the corridors are served by a separate system.

The construction in dispute involves the design of the HVAC system serving the facility. During the course of the BCC application process, the Applicant modified his proposed HVAC system. The basic design of the original system is as follows: In the patient wings two separate HVAC systems would operate. One of these would provide the patient rooms with supply air which would then be exhausted through a return air system in the washroom of each unit.

The other HVAC system, which is the same as the one that serves the core area, would supply air to the corridors. Exhaust in the corridors is to occur in the service rooms that open onto the corridors and by return air travelling through the corridors towards the core area. To get into the core area, the air must pass through a set of double doors located within a required fire separation. These doors are currently held open by magnetic hold open devices that are released when the fire alarm system has been activated. The doors are weather stripped to retard the passage of smoke through the corridors. In this design, air transfer grills would be positioned above these doors to allow the air easier passage through the one hour separation. The grills would not be equipped with smoke dampers or other fire stopping devices. In this system, the total volume of air supplied to each wing is equal to the total exhausted.

Under this proposal, the same air circulation principal would be applied to the central core area as well. The core area is also to be used as a return air plenum for the rooms to which it is adjacent. The air would be supplied and exhausted from all rooms located on the perimeter of the core area, while the core area itself would supplied independently. Air transfer ("supply/return") grills to allow for the exchange of air would be provided in the demising walls between the perimeter rooms and the centre of the core area.

For both of these areas (the core and the wings), the main air intake duct on each floor is located within the central core area at ceiling level.

The Applicant's subsequent modified proposal was designed to achieve what he described as "a

balanced air circulation system" in which no return air would travel from the wings of the building to its central core. To accomplish this, he offered to eliminate the air transfer grills over the doors in the fire separations. Moreover, he also planned to allow some infiltration of supply air into the patient rooms where it would get exhausted through the return air ducts in the unit washrooms by increasing the capacity of that system.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the ventilation and exhaust system that proposes to provide supply air from the corridors to the resident rooms and which will exhaust from the resident washrooms provides sufficiency of compliance with Sentence 6.2.3.10.(3) of the Ontario Building Code.

Sentence 6.2.3.10.(3) requires that, with certain exceptions not applicable here, a public corridor shall not be used as part of a supply, return or exhaust air system other than as part of a supply air system serving washroom facilities and similar auxiliary spaces that would open directly to a public corridor. In this instance (i.e., the latter, modified proposal), the corridors, which are equipped with a separate HVAC system, are also serving as a supply air system for adjoining areas, namely the patient rooms. This is also the case for the HVAC arrangement for the rooms located off the central core area. However, at the time of the hearing, the dispute between the parties was limited only on the HVAC systems in the wings of the subject building. The BCC thus focussed on that dispute alone.

4. Provisions of the Ontario Building Code

Sentence 6.2.3.10. Interconnection of Systems

(3) Except for Sentence 3.3.1.4.(4) and Sentences (4) & (5), a public corridor or corridor serving the public shall not be used a portion of a supply, return or exhaust air system serving adjoining areas, other than as part of a supply air system serving toilet rooms, bathrooms, shower rooms and similar auxiliary spaces opening directly to the public corridor or corridor used by the public.

5. Applicant's Position

The Agent for the Applicant submitted that the Richmond Hill Building Department rejected their original HVAC proposal. In particular, they "requested that combination smoke/fire dampers be installed at all return air transfer ducts that serve corridor wings." However, the Agent countered that "(t)he corridor wing doors are normally open and close in the event of a fire alarm as does the air handling systems." Nevertheless, it was in response to this municipal opposition that they modified their original proposal and offered an alternative to installing the smoke dampers and fire alarm connection. Instead, the Agent explained that he is now proposing to omit the corridor air transfer grills and would re-balance the air system such that no return air will travel into the core area.

The Agent submitted that this "...design philosophy for ventilation in Residential Home Areas of long-term care facilities provides supply air to the corridors and resident rooms, and exhaust from the resident washrooms and service rooms. The total supply equals the total exhaust. As this is a total fresh air system with no recirculation, there is no transfer of air to other adjacent zones in the building."

The Agent also emphasized that this proposal complies with the Ministry of Health and Long-Term Care Design Manual on ventilation. He argued that the modified HVAC system design is identical to those in the "vast majority of long term care facilities in Ontario". He also added that the subject design has been reviewed and approved by the Ministry of Health and the Office of the Fire Marshal of Ontario.

6. Respondent's Position

The Respondent submitted that the current (i.e., the latter) proposed HVAC system intends to utilize the corridors as supply air plenums. This, they noted, is in contradiction to both the permit drawings submitted and to Building Code requirements, specifically Sentence 6.2.3.10.(3). Despite the Applicant's proposal for air balancing, the Respondent was still of the opinion that the system was not in compliance with the OBC. He felt that it represented air mixing which was, in his opinion, not appropriate.

The Respondent also rejected the Agent's argument that the HVAC system was acceptable since it complies with the Ministry of Health's ventilation manual. He noted that that manual is intended only to address health related issues and that HVAC design in the newly constructed subject building must comply with the standards found in the OBC.

7. Commission Ruling

It is the decision of the Building Code Commission that the ventilation and exhaust system that proposes to provide supply air from the corridors to the resident rooms and to exhaust from the resident washrooms does not provide sufficiency of compliance with Sentence 6.2.3.10.(3) of the Ontario Building Code at York Central Hospital - Long Term Care Centre, 10 Trench Street, Richmond Hill, Ontario.

8. Reasons

i) The Code states that the public corridor shall not be used as a portion of the supply, return or exhaust system serving adjoining areas other than the listed exceptions.

ii) The adjoining patient bedrooms do not fall within the listed exemptions.

iii) No satisfactory compensating measures were offered to achieve sufficiency of compliance.

RULING

1. The Applicants

Mr. and Mrs. William McGuigan, owners, Caledon, Ontario, have received a building permit under the Building Code Act, 1986 and have constructed a residential building at 15995 Horseshoe Hill Road, Caledon, Ontario.

2. Description of Construction

The Applicants applied for a building permit in 1990 and thereafter constructed a custom two storey, detached dwelling.

The construction in dispute involves the design of the guard protecting exterior balconies. The guard is comprised entirely of welded 51 mm diameter tubular steel. The design consists of five parallel horizontal members spaced evenly apart with 178 mm between the top of one rail and the underside of the one above. The upper side of the lowest rail is measured at 152 mm above the balcony walking surface, whereas the upper side of the top rail, i.e. the total height of the guard, is 1,070 mm high. The horizontal members are supported by vertical posts located at 1,422 mm on centre. The horizontal distance between the vertical posts is 1,372 mm.

The guard is employed in a few locations on the exterior of the house. On the ground floor, a considerable distance of the guard has been installed, including around a semi-circular porch that overlooks a sunken patio located on the same level as the basement. There is also a small portion of the same guard on the second floor that protects a walkout balcony.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the as-built exterior guard provides sufficiency of compliance with Articles 9.8.8.7. and 9.8.8.8. of the 1986 Ontario Building Code. (As the permit to construct the house was applied for in March of 1990, the applicable regulation at that time was the 1986 Ontario Building Code.)

The first provision, Article 9.8.8.7., requires that openings in guards on balconies or exit stairs of residential occupancies be of size that prevent passage of a spherical object having a diameter of 100 mm. The guard under dispute has openings as measured between the horizontal and vertical members of 178 by 1,372 mm respectively.

Article 9.8.8.8., the latter provision, stipulates that required guards surrounding exterior balconies must be designed in such a way so as not to facilitate climbing between 100 and 900 mm above the floor or walking surface of the area the guard is protecting. In the subject guard there are four horizontal members located between the 100 and 900 mm range above the balcony surface.

The issue at dispute therefore is whether the guard, as designed and constructed, has openings large enough to allow a spherical object with a diameter of 100 m to pass through and whether it facilitates climbing.

4. Provisions of the Ontario Building Code

Article 9.8.8.7. Openings in Guards

Openings through a *guard* on a balcony or an *exit* stair, except an exit stair serving not more than 1 *dwelling unit*, shall be of size so as to prevent the passage of a spherical object having a diameter of 100

mm in *residential occupancies* and 200 mm in other *occupancies*, unless it can be shown that the location and size of such openings which exceed these limits do not represent a hazard.

Article 9.8.8.8. Design to Prevent Climbing

Guards around exterior balconies of buildings of *residential occupancy* shall be designed so that no member, attachment or opening located between 100 mm and 900 mm above the balcony floor will facilitate climbing.

5. Applicant's Position

At the outset, the Agent for the Applicant submitted that when considering the size of the balconies, their locations and the use of the house, the design of the guard is very safe. He argued that the openings and the alleged climbability have never been an issue. He noted that in all the years the owners have lived there no incident related to the guards has occurred.

The Agent explained that after living in their completed house for eight to nine years the owners realized that they never received their final inspection from the municipality. When this inspection occurred in 1999 the municipality took issue with the design of the guards. He stated that the design of the exterior balcony guard is the same as the one that appeared in the original drawings submitted for the building permit and approved by the Town of Caledon. Neither in the building permit approval process, nor during the inspections carried out later was there any indication from the municipality that the design of the subject guards did not comply with the Ontario Building Code.

The Agent also elaborated that the architecture of the house was based on Frank Lloyd Wright's prairie school design where the dominating theme is to create a horizontal linear sense. It was upon this concept that the horizontal rails of the guard were predicated. As he noted, in a house in which the overwhelming aesthetic is to reference the linear flatness of a prairie horizon, to add vertical pickets in the guards would be incongruous.

The Agent continued that guards comprised of several horizontal rails have been employed in many locations inside and outside Ontario. Of the examples of guards in Ontario, he cited specifically a bridge at Bronte Park in Caledon East and Ontario Place, both of which are used by the public.

The subject house has been designed as a country home for adult use, the Agent stated. It is not used by the wider public as it is a private residence. The house and its guards therefore receive constant supervision when guests are present, especially children. Taking these facts into account and considering that during the last eight years of occupancy there has been no incident connected to the guards under dispute, the Agent concluded that there is no danger associated with the openings and horizontal members of the subject guards.

Finally, the Agent suggested that they would be prepared to restrict the access to the subject balconies if it allows them to maintain the guards as they are. He hoped that the Commission would take a reasonable approach when deliberating on the safety of the guards.

6. Respondent's Position

The Designate for the Respondent submitted that the exterior balcony guards, as constructed and installed, do not conform with the requirements of the 1986 Ontario Building Code.

The Designate stated that at the time the drawings (showing the disputed guards) were submitted for the building permit they were clearly stamped in red, requiring compliance with the provisions of the OBC. Moreover, during the subsequent inspections of the house throughout its construction the guards were not inspected and declared non-compliant because they had not been installed.

The argument that the subject guards are acceptable because similar ones have been installed elsewhere was rejected by the Designate. He noted that the Agent used some examples from outside Ontario which are obviously not subject to the OBC. Also not covered by the OBC is the bridge structure. Further, Ontario Place is not a residential structure regulated under Part 9 of the Code, as is the Applicant's house.

The Designate also refuted the argument that the use of the house primarily by adults eliminates any potential hazard. That this is fact provides no basis for deviating from the Code. The OBC, he noted, does not have standards for guard design for houses with adults only and houses with adults and children. There is only a single standard for Part 9 construction. And the guard does not meet the requirements in two areas; the openings are far too large and the horizontal rails make it very climbable.

On the fist issue, the Designate stated that the test in Article 9.8.8.7. is that "unless" an opening larger than 100 mm in diameter can be shown not to be a hazard then it cannot be allowed. The openings are many times the size permitted, the vertical drop between the balconies and the adjacent grade is significant and the Agent has demonstrated nothing to prove that such openings are not a hazard. As a result, the guard has not met the "unless" test in OBC 9.8.8.7.

Regarding climbability, the Designate discussed that Article 9.8.8.8. hinges on whether the guard "facilitates climbing". With regularly spaced horizontal rails, the guard looks exactly like a ladder. Clearly, such a design facilitates climbing, he asserted.

The Designate concluded by pointing out that the Applicants and their Agent are offering to restrict access to the disputed guards and balconies. By doing so, he argued that they are admitting that the guards are a hazard because they are trying to keep people away from them. Moreover, restricting access to an area of a building is also not a reason to justify a deviation from the minimum safety requirements of the Ontario Building Code. Lastly, he stated that this is a required guard and it must be built according to Code.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-built exterior guards do not provide sufficiency of compliance with Articles 9.8.8.7. and 9.8.8.8. of the 1986 Ontario Building Code at the McGuigan Residence, 15995 Horseshoe Hill Road, Caledon, Ontario.

8. Reasons

- The subject guards, with their horizontal members, create a clear ladder effect and are therefore considered as facilitating climbing.

- The openings are well in excess of the 100 mm diameter threshold. In fact, they are large enough to allow a small child to pass through.

Applicant

RULING

1. The Applicant

Ms. Karen Schad , Director, Carp Ridge Community School, Carp, Ontario, has received a building permit under the Building Code Act, 1992 to install a Class 4 septic system at 4596 Carp Road, Carp, Ontario.

2. Description of Construction

The Applicant has constructed a portable school building containing one classroom and a washroom yet to be built. The building is described as having a Group A, Division 2 - Assembly Occupancy. The total number of plumbing fixture units is 12.5 and the building has a total finished area of 173 m2. The calculated daily design sewage flow, based on 35 persons at 30 litres per day, is 1 050 litres.

The Applicant has received a building permit to install a Class 4 raised bed sewage system to serve the existing school and a future eco-wellness centre with an approximate building area of 75 m2 to be constructed in the near future. The building permit for the school building has been issued on the basis of an occupancy threshold of 12 persons, however the ultimate development would increase this number to 35 persons. The original proposal, based on which the building permit for the septic system has been issued, comprises a plumbing system with two water closets, an urinal and two lavatories. Later, the Applicant changed this proposal to substitute the water closets with a proprietary composting toilet system (Clivus Multrum Model) with two toilets. The black water from the urinal and the grey water from the remaining plumbing fixtures will be directed to a Class 4 septic system.

The subject site is a 7.29 hectare country lot with minimal slope and is mostly covered with mature trees. The depth to the bed rock is roughly 200 mm. The percolation time of the native soil is reported to be more than 50 min/cm. The water supply to the site will be from two drilled wells.

<![if !supportEmptyParas]

The construction in dispute involves the substitution of the two water closets with a composting toilet system.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed substitution of two water closets with a proprietary composting toilet system to serve a one-classroom portable school with an adequate water supply provides sufficiency of compliance with Sentence 3.7.4.1.(2) and Part 8 of the Ontario Building Code.

Sentence 3.7.4.1(2) allows the use of sanitary units without a water connection such as sanitary privies, chemical toilets, or composting toilets, which are classified as Class 1 systems under Part 8 of the OBC, wherever a sanitary drainage system cannot be installed due to the lack of water supply. A sanitary drainage system is defined as " a drainage system that conducts sanitary sewage" under Article 1.1.3.2. of the Ontario Building Code (OBC). Sanitary sewage means " liquid or water borne waste (a) of industrial or commercial origin, or (b) of domestic origin, including human body waste, toilet or other bathroom waste, and shower, tub, culinary, sink and laundry waste" (Article 1.1.3.2). The site under dispute has two drilled wells for water supply. The black water originating from the urinal and the greywater originating from other plumbing fixtures will be directed to a Class 4 raised bed sewage system. The human body waste other than that originating from the urinal is proposed to be handled by the composting system.

Therefore, at issue is whether the proposed substitution of two water closets with a Class 1 composting toilet system despite an adequate water supply to the site affects the sufficiency of the system in complying with related requirements of the OBC.

4. Provisions of the Ontario Building Code

Sentence 3.7.4.1 (2) **Plumbing and Drainage Systems**

(2) When the installation of a sanitary drainage system is not possible because of the absence of a water supply, sanitary privies, chemical closets or other means for the disposal of human waste shall be provided.

Part 8 **Sewage Systems**

5. Applicant's Position

The Applicant submitted that the Clivus Multrum composting toilets are largely being used in other provinces such as British Colombia and have proved to be environmentally friendly.

The Applicant, stated that they will soon construct an eco-wellness centre on the subject site to host workshops and seminars on environmentally friendly technology. So as a first step, they want to provide a model for these kinds of initiatives.

The Applicant indicated that the "Wild Care Bird Centre" located in Ottawa has been using a similar composting toilet system for more than 8 years serving more than 10 000 visitors per year without any problem.

The Applicant continued that their original submission to the Building Code Commission included a composting toilet system in conjunction with a greywater system (Class 2) to replace the Class 4 system. However, because of the lack of time to investigate the suitability of the greywater system for the site under dispute and also comparatively high cost of installing a greywater system, they have changed their submission to include the proposed substitution of two water closets with a composting toilet system and to discharge the remaining sewage, including the "composting tea" from the composter to the approved Class 4 system.

6. Respondent's Position

The Respondent chose not to attend the hearing, so the Commission relied on his written submission for the purpose of hearing.

The Respondent submitted that the installation of a composting toilet system in lieu of two water closets is not permitted under the OBC, which requires the installation of water closets wherever there is an adequate water supply.

The Respondent proposed that the installation of a composting toilet system in addition to the minimum number of required water closets would be acceptable, if they can agree (with the Applicant) on a monitoring system to evaluate the performance level of this system.

7. Commission Ruling

It is the decision of the Building Code Commission the proposed two-toilet Class 1 composting system provides sufficiency of compliance with Sentence 3.7.4.1.(2), on the condition that, any liquid (composting tea) produced from the system is discharged to the approved Class 4 system.

8. Reasons

i. The proposed Class 1 composting system for this eco-wellness centre classroom with 12 students is an acceptable substitute for a water closet provided the excess liquid is discharged to a Class 3,4 or 5 sewage system (8.3.1.2.(3)).

The Respondent

RULING

1. The Applicant

Mr. David Bath, Homeowner, Stoney Creek, Ontario, has received an order to comply under the Building Code Act, 1992 to up-grade the existing sewage system at 208 Upper Mount Albion Road, Stoney Creek, Ontario.

2. Description of Construction

The Applicant is constructing a new addition to his one storey Group C - residential building. The existing building has an area of 83.24 m2 and accommodates two bedrooms. The new addition includes the expansion of the main floor and the construction of a second floor that will house an extra bedroom. With this, the total finished area of the dwelling will increase to 239.22 m^2. The calculated daily design sewage flow is 2000 litres. The total number of plumbing fixture units, as reported by the Respondent, is 13.

The existing building was constructed before 1950. The Applicant bought the house in 1982. In 1995, he decided to customize the house. In 1996, the Applicant discussed his proposal for a new addition with the then-enforcement authority for regulations governing on-site sewage systems (the Ministry of the Environment). A response from the Health Unit, at that time, indicated that he did not need to obtain a Certificate of Approval for a new sewage system as he was only proposing to enlarge the first floor without any additional plumbing fixture units. In 1997, the Applicant constructed the footings without a building permit. In 1998, after a "stop work order" was issued by the municipality, the Applicant formally applied for a building permit and received a conditional permit. At this time, the septic regulations were transferred to the Ministry of Municipal Affairs and Housing. For this reason, later in November of 1999, when the Applicant applied for a building permit and submitted the working drawings for his proposal to finish the construction, he was required to upgrade the existing sewage system. The Applicant continued the construction of the new addition until he was issued an "order to comply" and a "stop work order" both in March of 2000.

The construction in dispute involves the adequacy of the existing septic system in servicing the enlarged dwelling

Two different drawings were submitted to demonstrate the existing septic system, which is described as an in-ground absorption trench system consisting of a 4500 litre septic tank and a leaching bed. The leaching bed was described as consisting of six tile runs and nine tile runs in different drawings. The septic tank, as shown in the drawings, is set back 3m from the existing building and 1.5 m and 2.4 m from the new addition. The clearance distance between the absorption trenches and the new construction is 0.6 m. The total length of the absorption trenches is 64 m for the six-tile run bed. During the hearing, the Applicant indicated that there is also a greywater system connected to the leaching bed. However, he did not know where exactly it is located nor its capacity.

The subject site has an area of 1393 m2 and a slope of three percent. The native soil is reported to be clay soil with a percolation time of more than 50 min/cm.

The water supply to the site is provided by municipal water supply.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the performance level of the existing sewage system, when considering the proposed renovation that will increase the number of bedrooms and the total finished area by more than 15%, provides sufficiency of compliance with Sentences 11.4.2.5.(3) and 11.4.3.6.(1) of the Ontario Building Code.

Sentence 11.4.2.5.(3) sets out the situations that would reduce the performance level of an existing dwelling. These situations include an addition of more than 15% to the building area of an existing dwelling, an increase in the number of the plumbing fixture units, and an increase in the number of bedrooms that together, or alone would result in a daily design sewage flow in excess of the designed capacity for any component of an existing sewage system. In other words, if the resultant increase in the daily design sewage flow, due to any of the above conditions, exceeds the capacity of one component or the whole septic system, the performance level of the dwelling is reduced.

Sentence 11.4.3.6.(1) requires up-grading of an existing septic system to comply with requirements of Part 8, if the performance level of the dwelling is reduced. In other words, this sentence applies, if one of the conditions specified in Sentence 11.4.2.5.(3) leads to a reduction in performance level of an existing dwelling.

In the present case the addition to the subject building area is more than 50 percent and the number of bedrooms is increased from two to three. There is no change in the total number of plumbing fixture units, which is reported to be six by the Applicant, but 13 by the Respondent.

Therefore, at issue is whether the subject additions negatively affect the performance level of the existing building and, as a result, require that the existing septic system be upgraded.

4. Provisions of the Ontario Building Code

Sentence 11.4.2.5 Sewage Systems

(3) The performance level of an existing dwelling unit is reduced where proposed construction which,

a. increases the number of bedrooms in the dwelling unit,
b. exceeds 15% of the gross area of the dwelling unit, or
c. adds new plumbing fixtures to the dwelling unit, will result in the total daily design sanitary sewage flow of the dwelling unit, calculated in accordance with Article 8.2.1.3., exceeding the capacity of any component of a sewage system the dwelling unit.

Sentence 11.4.3.6. Sewage Systems

(1) Where the performance level of an existing building is reduced under Article 11.4.2.5., upgrading of a sewage system which is adversely affected by a construction, increase in occupant load, increase in the total daily design sanitary sewage flow or change in amount or type of sanitary sewage shall be required in conformance with Part 8

5. Applicant's Position

The Agent for the Applicant submitted that the construction of the new addition started in 1996 and continued as funds became available. He was not informed of any time restriction for a building permit nor was he aware of the transfer of the septic regulations to the Ministry of Municipal Affairs and Housing.

The Agent argued that the municipality had not informed the Applicant about the reasons for what the conditional building permit was issued. Had he (the Applicant) been informed about this, he would not have continued the construction.

The Agent then stated that she believes that there should be a mechanism to allow the Applicant to finish the construction. If the sewage system does not function properly, then the Applicant should be required to upgrade the system. With a system that is functioning well for years and with the possibility of municipal sewers coming to the site soon, the upgrading of the system imposes an unnecessary burden on her client, she argued.

The Agent proposed that the Applicant be allowed to finish the roof to protect the constructed parts, on the condition that the newly built areas are not occupied.

6. Respondent's Position

The Respondent submitted that the application for a building permit was submitted in 1998. Therefore, it should be processed under current regulations that require upgrading of the existing septic system.

The Respondent stated that the conditional permit was issued to legitimize what was already in the ground. The application for the building permit with the drawings were submitted in November 1999. At this time, the foundation walls had also been constructed.

The Respondent argued that it was after examining the building drawings that the addition of a new bedroom was discovered. In addition, the increase in building area is significant. For all these reasons, it was their position that the performance level of the existing building is reduced and the existing septic system is required to be upgraded to comply with the requirements of Part 8 of the Ontario Building Code.

7. Commission Ruling

It is the decision of the Building Code Commission that the performance level of the existing dwelling is reduced by construction of the proposed additional bedroom and floor area. The sewage system must be upgraded to service the proposed construction.

8. Reasons

i. The sewage load for the proposed house far exceeds the capacity of the existing system.
ii. The existing sewage system does not meet the setback requirements from the new foundation and appears to be constructed in soils with a percolation time greater than permitted for a trenched inground leaching bed.
iii. There was no demonstration that the existing leaching bed is functioning adequately except for the comment that there is no seepage.
iv. The greywater system does not meet the requirements of the Ontario Building Code.

RULING

1. The Applicant

Ms. Heather Feikema, Environmental Engineer, IKO Industries, Brampton, Ontario, has received an order to comply under the Building Code Act, 1992 to remedy certain alleged deficiencies regarding a drainage system serving new plumbing fixtures installed at 40A Hansen Road South, Brampton, Ontario.

2. Description of Construction

The Applicant has recently made renovations to an existing building with an F2 major occupancy. The structure is described as two storeys in building height, 4,580 m^2 in building area and is of combustible construction. The building is equipped with a sprinkler system.

As part of the renovation on the ground floor, the Applicant added a new hand washing sink in a newly constructed laboratory. As well, new male and female staff washrooms were installed, each with a sink and water closet. Also added, adjacent to the washrooms, is a single stall shower room. The lab sink is located approximately 37 m (120 ft) from the washroom/shower area.

The construction in dispute involves the drainage piping for the laboratory sink and five plumbing fixtures installed in the new washrooms and shower as described above. A 100 mm (4 in) sanitary drain pipe, approximately 37 m (120 ft) in length, has been installed for the hand sink. Also connected to this sanitary pipe are the fixtures in the washrooms and the shower stall. The pipe drains to a sump pit located in the area of the new washrooms. Sanitary sewage is then pumped up and across the ceiling space of the existing ground floor of the facility for a distance of approximately 15.5 m (50 ft) where it returns to ground level and feeds into an existing cleanout.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the as-installed sanitary drainage system that includes a sump pit and pumps provides sufficiency of compliance with Article 7.4.6.3. of the Ontario Building Code. This provision describes the conditions when pumps and tanks can be used and sets out requirements. In particular, Sentence (1) stipulates that only drainage piping that is not capable of draining by gravity may be connected into a sewage tank with pumping devices. In the case at hand, while it may be possible through an extensive retrofit to drain by gravity, all drainage piping for the subject fixtures is provided through mechanical means (i.e. a sump pit and pumps).

Specifically, the issue before the Commission is whether the as-built drainage piping that utilizes a mechanical pumping system in lieu of gravity-based drainage sufficiently complies with Sentence 7.4.6.3.(1) of the Code regarding circumstances of installation for sumps and tanks. In addressing this

question, the Commission must assess whether, as an existing building, "construction difficulties" as envisaged in Article 11.5.2.1. were sufficient to warrant the use of an alternative method of Code compliance.

4. Provisions of the Ontario Building Code

Article 7.4.6.3. Sumps or Tanks

1. Only piping that is too low to drain into a building sewer by gravity shall be drained to sump or receiving tank.
2. Where the sump or tank receives sanitary sewage it shall be water and air-tight and shall be vented.
3. Equipment such as a pump or ejector than can lift the contents of the sump or tank discharge it into the sanitary building drain or sanitary building swear shall be installed.
4. Where the equipment does not operate automatically the capacity of the sump shall be sufficient to hold at least a 24 hours accumulation of liquid.
5. Where there is a building trap the discharge pipe from the equipment shall be connected to the sanitary building drain downstream of the trap.
6. The discharge pipe from every sanitary sewage sump shall be equipped with a union, a check valve and a shut-off valve installed in that sequence in the direction of discharged.
7. The discharge piping from a pump or ejector shall be sized for optimum flow velocities at pump design conditions.

5. Applicant's Position

The Applicant submitted that it was IKO's intent to renovate and update their 50 year old building. Accordingly they set out to convert a portion of the subject building into a laboratory and install new male and female staff washroom facilities on the ground level.

Regarding the issue of building without the issuance of a permit, the Applicant argued that they had difficultly in obtaining a permit at the time due to a City strike in progress. Moreover, the office building and laboratory space were critically needed and they could not afford to hold off on the renovations indefinitely, as the City allegedly refused to inspect the rest of the plumbing.

The Applicant noted that the newly installed laboratory sink was installed 15.5 m (50 ft) from the existing sanitary connection. It was not practical and would have likely resulted in future problems if the washroom fixtures and the laboratory sink were drained by gravity, as mandated by the OBC. This is because over that considerable distance and the limited fall possible, the drainage pipe would have only been able to achieve a minimum slope. As a result, given the situation, the Applicant felt that the only practical method was to install the sump pump, as the 'regulated' slope could not be maintained otherwise. The Agent for the Applicant further added that he was aware that the construction was *not* to Code, but he too asserted that a proper 1% slope could not be maintained if they strictly adhered to Code provisions.

In addition, the Applicant was concerned over the impact of cutting through the existing flooring. She stated that the decision to install the sump pump was selected because the alternative involved cutting the floor through a Print Shop and Machine Shop, both of which operate on a 24 hour basis. The loss of production, workers hours and money were notable concerns in the disruption of these shops' operations.

To reinforce her position, the Applicant also indicated that IKO consulted with and sought the advice of a professional engineer who recommended the that the installation of the sump pump was in keeping with good engineering practice and existing site conditions. The engineer's opinion was that installing a new drain by gravity and "cutting existing floor within existing industrial, fully occupied and obstructed spaces, was not practical."

6. Respondent's Position

At the outset, the Respondent clarified that the City strike did not interfere in the permit process, and that the strike itself was not in progress during the time of the client's permit request. Moreover, the Respondent felt that it was the Applicant's responsibility to attain the proper permit before proceeding with construction. Yet, the renovations in question were completed prior to the issuance of a permit. The Respondent stated that if the BCC were to approve the subject completed work it would send a

misleading message. In effect it would tell people that even work not done in accordance with Code, but which has been finished, will nevertheless get approved.

In addition, it was noted that Jerry Monaco, the City Plumbing Plans Examiner, went to assess the site only to discover the job had been completed. At that point he felt that he had no business to comment on the subject installations.

The Respondent then elaborated upon the City's policy regarding alternative construction approaches, which was developed to consider projects that do not completely conform and/or are deemed to face substantial challenges in terms of achieving strict conformance to Code requirements. As noted, she explained that she does not consider the regulations of the Building Code as the only construction approach, and is thus willing to consider alternatives given the proper circumstances. However, she felt strongly that the case in question was not eligible to be considered under their policy with respect to 'disruption distances.' This policy stipulates that 310 m (1000 ft) is the threshold when construction alternatives may be considered. Moreover, the policy was also not applicable because she felt it was viable to construct in accordance with Code for the disputed drainage work.

Turning to the technical issues, the Respondent stated that the dispute at hand is whether there is sufficient slope. While she acknowledged that the engineer supported the as-built drainage system including sump pit and pumps, the same engineer's report, she argued, noted that the plumbing installation was capable of being drained by gravity. Indeed, the engineer's calculations verified that sufficient fall exists for the approximately 15.5 m (50 ft) of drainage pipe required to drain the new plumbing fixtures. Gravity drainage is possible because the existing invert on the riser is approximately 47 cm (18 in) below finished floor. By reducing the thickness of the concrete floor, the required fall could be achieved, she explained.

Since the disputed drainage was possible by means of gravity, the Municipality's view was that no insurmountable construction difficulties were present. Therefore, the installation of the sewage tank could not be approved, as Article 7.4.6.3. of the OBC prohibits the subject drainage piping from draining into a sanitary sewage tank.

In addition, the Respondent argued that the Applicant's claim of cutting 15.5 m (50 ft) through the shop floors as being a significant construction challenge was spurious. As she indicated, the Applicant had already cut through 37 m (120 ft) of concrete floor to connect the laboratory sink as well as the new washrooms and shower to the sump pit. Also, the Applicant went to the effort of installing a complicated drainage system that includes above ground piping running through the ceiling space of the shop areas.

Regarding the issue of potential work disruption and financial impacts that may be caused by cutting through existing flooring, the Respondent stated that their concern was focussed on the fact that the as-built drainage system not only does not comply with the OBC, but in their view was a significant deviation from the Code.

In summation, the Respondent stressed that it was her job to enforce the Building Code and not to be swayed by financial factors or by the fact that the work was completed prior to the issuance of a permit. Therefore, the City was of the opinion that the as-constructed mechanical sewage pumping system cannot be substituted for gravity drains when drainage could be achieved in conformance with OBC provisions.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-installed sanitary drainage system that includes a sump pit and pumps provides sufficiency of compliance with Sentence 7.4.6.3.(1) of the Ontario Building Code at 40A Hansen Road South, Brampton Ontario.

8. Reasons

i. In our opinion, the installation of a gravity based drainage system in the present circumstance would meet with certain construction difficulties.
ii. The as-built system with a sump pit and pumps should perform adequately and therefore achieves sufficiency of compliance with Code requirements.

Agent for the Applicant

Mr. Collin Potter
Plans Examiner/Building Inspector
City of Stoney Creek
Designate for the Respondent

RULING

1. The Applicant

Mr. Paul Brophy, Engineering Manager, Orlick Industries Ltd., Hamilton, Ontario, received an Order to Comply under the Building Code Act, 1992 requiring that a standpipe and hose system be installed in the Orlick Industries Ltd. building located at 20 Teal Avenue, Stoney Creek, Ontario.

2. Description of Construction

In 1998, the Applicant purchased the existing building at 20 Teal Avenue for the purpose of operating an aluminium smelting plant, considered to be a Group F, Division 3 industrial occupancy. Since 1999, two additions have been constructed. The first was an addition of 440 m^2 at the northeast portion of the facility. It houses a gas-fired furnace used to re-melt poor quality aluminum products, for recycling into holding ovens within the diecasting area. The second addition, located at the north face of the building, contains mechanical and electrical rooms as well as holding rooms for equalization and bio-reactor tanks. This second addition has an area of approximately 370 m^2. During this same period, the existing standpipe system was removed from the original building without the benefit of a demolition permit. As a result of the two additions to the original building, the total area of the plant is now 12, 775 m^2.

The entire facility consists of a one storey manufacturing area with a two storey office portion. The building is of noncombustible construction and will be equipped with 60 ABC and BC type fire extinguishers. Currently, the facility is neither sprinklered nor equipped with a fire alarm system. It is, however, proposed that a fire detection/alarm system will be installed throughout the building. The plant will ultimately contain eight electrical induction furnaces and one gas-fired furnace. The hydraulic fluid used in this operation is a nonflammable liquid.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the compensating measures offered in lieu of a standpipe and hose system, provide sufficiency of compliance with Article 3.2.9.1. of the Ontario Building Code. Specifically, Article 3.2.9.1. requires that a one storey building with an area in excess of 3000 m^2 in area, and containing a Group F, Division 3 occupancy, be provided with standpipe and hose system, if the building is not sprinklered.

The building in question is not sprinklered and is well in excess of 3000 m^2 in area. In addition, the original portion of the building, when purchased by the Applicant, did contain the required standpipe and hose system, but this has since been removed.

4. Provisions of the Ontario Building Code

Article 3.2.9. Standpipe Systems

3.2.9.1. Where Required

(1) Except as provided in Sentences (4) to (7), a standpipe system shall be installed in every building that

- is more than 3 storeys in building height,
- is more than 14 m (45 ft 11 in) high measured between grade and the ceiling of the top storey, or
- is not more than 14 m (45 ft 11 in) high measured between grade and the ceiling of the top storey but has a building area exceeding the area shown in Table 3.2.9.1. for the applicable building height if the building is not sprinklered.

Table 3.2.9.1.

Building Limits without Standpipe Systems

Forming Part of Sentence 3.2.9.1.(1)

***Occupancy* Classification**	***Building Area*, m^2 (ft^2)**		
1 *Storey*	**2 *Storeys***	**3 *Storeys***	
A C D F, Division 2 F, Division 3	2 500 (24,200) 2 000 (21,500) 4 000 (43,100) 2 000 (21,500) 3 000 (32,300)	2 000 (21,500) 1 500 (16,100) 3 000 (32,300) 1 500 (16,100) 2 000 (21,500)	1 500 (16,100) 1 000 (10,800) 2 000 (21,500) 1 000 (10,800) 1 000 (10,800)
Column 1	2	3	4

5. Applicant's Position

The Applicant submitted that he wanted to avoid a "dry system" because of the nature of the manufacturing undertaken in this plant. He is concerned with the possible fatal reaction of molten aluminum material with water from any source, including a standpipe system. The combination of molten aluminum and water would create a steam explosion, resulting in considerable damage and potential loss of life. The Applicant stated that the handling of molten aluminum is not formally addressed in the Building Code and, while a standpipe system would be appropriate in normal

circumstances, it should not be required in this aluminium smelting facility.

As compensation for the omission of a standpipe and hose system the Applicant lists, among others, the following factors:

- The entire complex is of noncombustible construction and the building contains minimal fuel load.
- The property can be considered to face two streets thereby permitting the Fire Department with full access to the building.
- There are two municipal fire hydrants in close proximity to the exterior of the building.
- A fire detection/alarm system is proposed to be installed throughout the building.
- Increased fire protection from small fires will be provided by the installation of twice the required number of fire extinguishers.
- The Fire Safety Plan will address extinguisher and fire safety training for staff, in addition, the Company would conduct regular pre-fire planning sessions with the Fire Department.

The Applicant urged the panel to consider the benefit of fire hydrants made accessible to knowledgeable fire fighters versus the potential hazard of standpipe and hose systems used by employees as a first action measure against a fire.

6. Respondent's Position

The Respondent submitted that there were presently no safety measures in place at this plant. He advised the Commission that he had no authority to waive the standpipe and hose requirement as dictated by the Building Code and would, therefore, defer to the Commission in this regard.

The Respondent did request that a fire alarm system be a condition of any approval, if a favourable ruling was to be granted.

7. Commission Ruling

It is the decision of the Building Code Commission that the Orlick Industries Ltd. plant at 20 Teal Avenue in the City of Stoney Creek provides sufficiency of compliance with Article 3.1.9.1. of the Building Code provided that

a) An approved Fire Safety Plan be provided.

b) A single stage fire detection and alarm system, designed in accordance with Section 3.2.4., be installed throughout the entire facility.

8. Reasons

i. The use of the building as an aluminium smelting plant, combined with the potential for the introduction of water through a standpipe and hose system would create a hazardous situation, unnecessarily endangering the lives of the occupants.

ii. A Fire Safety Plan will be provided that will indicate to the municipal Fire Department that the subject plant is not equipped with a standpipe and hose system and will outline the training for employees in the use of fire extinguishers.

iii. The fire alarm system will provide early warning of emergency situations.

RULING

1. The Applicants

Messrs. Lawrence A. Lundy and Antony T. F. Lundy, Toronto, Ontario, received a building permit under the Building Code Act, 1990 and constructed a cottage at Cranberry Cove Fire Route, Hamer Bay, Lake Joseph, Seguin Township, Ontario.

2. Description of Construction

The Applicants received a building permit in 1992 and constructed their new seasonal cottage sometime thereafter based on the standards found in the 1990 version of the Ontario Building Code. The building is a Group C - residential occupancy and consists of a main cottage that includes a hexagonal-shaped tower and a guest house, that is to be connected by a breeze way. (There is also a boathouse on the subject property.) The main building is two storeys in building height (including basement) and occupies

a building area of 263 m^2 (2,835 ft^2). The building is of combustible construction and is equipped with sprinkler and fire alarm systems.

The construction in dispute involves three sets of stairs with accompanying handrails and two guards installed in different areas of the building. For the sake of clarity, each of the three stairs will be referred to as stair A, B, or C. The guards will be referred to as either guard 1 or 2.

The first stair (referred to as stair A) provides access from the ground level of the main cottage to the upper level of the hexagonal-shaped tower. This area is less than 20 m^2 and is used as an office. The stairs leading to the office are 737 mm (2 ft, 5 in) wide and are the only means of egress provided from this floor area. (Although the office area does have a door that opens onto a deck constructed over a portion of the first floor roof.) The stairs contain two sets of winders less than 1,200 mm (3 ft, 11 in) apart that turn in opposite directions. The first winder turns through an angle of 45^0 and the second winder rotates 90^0. (These two winders thereby create a rough S-shape to the stair.) Stair A also has varying riser heights, ranging between 234 and 242 mm (9 1/8 and 9 ? in). Accompanying these stairs is a handrail attached to the tower's exterior wall. This handrail is not continuous, however, as it switches to the other (or interior) side on the lower half of the stair.

A guard (referred to as guard 1) separates the remainder of the office from the stair opening. It is measured at 737 mm (2 ft, 5 in) in height.

The second stair (referred to as stair B) is an open-tread stair and provides access from the ground floor to a loft bedroom located on an upper level. Stair B is 559 mm (1 ft, 10 in) in width and is also the only means of egress from this floor area. The upper portion of these stairs can be described as curved as they rotate 180^0 around a central column. From their mid-point, the stair then continues straight to the ground floor level. The riser height is 222 mm (8 3/4 in) throughout and the tread depth (straight portion only) is 228 mm (9 in) with a run of 152 mm (6 in). The run dimension in the upper, curved portion of stair B does not meet the minimum run of 150 mm (5 7/8 in) for curved stairs not in exits.

Stair C provides access to the raised platform area that serves the upper shelf level of the library, which is located in the basement of the subject cottage. The access to this platform is provided through an irregular stair located under the platform itself. The stair (from the bottom) consists of two winder stairs that lead to a square landing. Users are then required to make a 90^0 turn and then mount a seven step ladder. The ladder is comprised of a central stringer with alternating steps protruding out from either side. There is no handrail. The entire stair is hidden from view as it is located behind a swinging bookshelf found on the lower level. No information was provided regarding the run and rise of stair C.

The guard protecting the upper bookshelf platform (referred to as guard 2) is an open guard. It consists of a single horizontal rail and two diagonal members that create an X shape in the space between the platform floor and the horizontal rail and between the vertical posts.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the as-built stairs, handrails and guards provide sufficiency of compliance with Sentences 9.8.2.1.(1), 9.8.3.1.(1) and 9.8.3.3.(2), Article 9.8.5.2., Sentences 9.8.5.3.(1) and (2), Clause 9.8.7.1.(1)(a), Articles 9.8.7.2. and 9.8.7.6., Sentence 9.8.8.2.(5) and Article 9.8.8.4. of the 1990 Ontario Building Code.

The building permit for the subject cottage was issued in 1992. The applicable regulation at that time was the 1990 OBC. The following table summarizes the requirements of the 1990 Code and compares it with the existing situation in the subject cottage.

Provision of the Code in dispute	Required	Existing Situation
Sentence 9.8.2.1.(1)	Uniform rise and run is required in any one flight	Stair A: has various riser heights, ranging from 234 to 242 mm Stair C: consists of three stairs, a landing, and a ladder
Sentence 9.8.3.1.(1)	Required dimensions for interior and exterior stairs serving a dwelling unit: Maximum rise: 200 mm Minimum run: 210 mm Minimum tread width: 235 mm	Stair A: all risers exceed maximum Stair B: all risers exceed maximum Stair C: no information
Sentence 9.8.3.3.(2)	At least one stairway must have a minimum width of not less than 860 mm between floor levels	Stair A: 737 mm wide Stair B: 559 mm wide

Article 9.8.5.2.	Curved stairs not allowed as exits stairs shall have an average run of 200 mm and a minimum run of 150 mm	Stair B: average run appears to comply, minimum run, at 0 mm, does not
Sentence 9.8.5.3.(1)	Winders shall not turn through an angle of more than 90^0 and individual treads shall have a 30^0 rotation each	Stair A: top winder turns through approximately 45^0 on a single step
Sentence 9.8.5.3.(2)	Only one winder is permitted between floor levels	Stair A: contains two winders
Clause 9.8.7.1.(1)(a)	At least one handrail shall be provided in a stair less than 1100 mm in width	Stair A: no handrail
Article 9.8.7.2.	A handrail shall be continuous throughout the stair	Stair A: handrail is interrupted as it changes sides of the stair Stair C: no handrail
Article 9.8.7.6.	A clearance of at least 40 mm shall be provided between the handrail and the wall to which it is attached	Stair A: no clearance provided Stair C: no handrail
Sentence 9.8.8.2.(5)	All guards within dwelling units other than those for stairs must be at least 900 mm high	Guard 1: 737 mm high Guard 2: no information provided regarding height
Article 9.8.8.4.	In a residential occupancy a guard on a balcony must not have an opening that allows passage of an spherical object with a diameter of 100 mm, unless it is shown that the openings do not represent a hazard	Guard 2: is an open design

4. Provisions of the Ontario Building Code

Article 9.8.2.1. Uniform Treads and Risers

(1) Treads and risers shall have uniform rise and run in any one flight.

Sentence 9.8.3.1. Rise and Run of Stairs

- Except for stairs to areas used only as service rooms, interior stairs within *dwelling units* and exterior stairs serving dwelling units shall have a maximum rise of 200 mm ($7^{7/8}$ in), a minimum run of 210 mm ($8^{1/4}$) and a minimum tread width of 235 mm ($9^{1/4}$).

Sentence 9.8.3.3. Stair Width

- At least one stairway between each floor level in a *dwelling unit* shall have a minimum width between wall faces of not less than 860 mm (2 ft 10 in).

Article 9.8.5.2. Curved Stairs not in Exits

Except as permitted in Article 9.8.5.3., a curved stair not required as an exit shall have an average run of not less than 200 mm ($7^{7/8}$ in) and a minimum run of 150 mm ($5^{7/8}$) and shall have risers conforming to Article 9.8.3.1.

Article 9.8.5.3. Winders

- Stairs within *dwelling units* may contain winders that turn through an angle of not more than 90 and individual treads turn through an angle of 30.

- Only one set of winders described in Sentence (1) shall be permitted between floor levels.

Clause 9.8.7.1. Required Handrails

- Except as permitted in Sentences (2) and (3), a handrail shall be provided on

- at least one side of stairs less than 1 100 mm (3 ft 7 in) in width.

Article 9.8.7.2. Continuous Handrail

Except for stairs serving 1 *dwelling unit*, not less than one handrail shall be continuous through the length of the stairway, including landings, except where interrupted by doorways or newels at changes in direction. (See A-3.4.6.4.(5) in Appendix A).

Article 9.8.7.6. Handrail Clearance

A clearance of at least 40 mm ($1^{9/16}$) shall be provided between each handrail and the wall to which it is fastened.

Article 9.8.8.2. Height of Guards

- All required *guards* within dwelling units other than those described in Sentence (4) shall be not less than 900 mm (2 ft 11 in) high.

Article 9.8.8.4. Openings in Guards

Openings through a guard on a balcony, an exit stair, or stairs, landings and the floor level around a stairwell in a *dwelling unit*, shall be of a size so as to prevent the passage of a spherical object having a diameter of 100 mm (4 in) in *residential occupancies* and 200 mm ($7^{7/8}$) in other occupancies, unless it can be shown that the location and size of such openings which exceed the limits do not represent a hazard.

5. Applicant's Position

The Agent for the Applicant submitted that during five years of use they have not experienced any safety problems regarding the subject stairs or guards. Moreover, they have not encountered any difficulty moving furniture to the upper levels.

The Agent stated that the cottage was designed by an architect and that construction was supervised by an engineer. Their work took into consideration the building type, usage, frequency of use, and limited space when designing and building the cottage, including the stairs. Considering the limited space, compliance with provisions such as those governing winders in stairs would create more problems than they would solve the Agent argued. He also noted the quality craftsmanship that went into constructing the cottage. In dealing with the particular issues the Agent did not address the specifics of the Code provisions in dispute.

Regarding Stair A, the Agent stated that it has been built into a very tight space, and because of the shape of the tower it had to conform to a restricted geometry in terms of its design. He argued that the upper level, or office area, of the tower was safe because an alternative exit is available on the roof of the building.

The Agent also likened the office area to a mezzanine in live/work units found in Article 9.8.3.1. of the 1997 version of the OBC. He noted that such units have no maximum rise, no minimum run and no minimum tread width for stairs accessing mezzanines. He argued that if such relaxations were permitted in this instance, they could also be applied to the use at hand.

In terms of Stair B, the Agent explained that the original design had a ladder accessing the upper loft level but once the building had been framed it was realized that a regular, albeit narrow, stair could be built. It was felt that this was far safer than the original ladder proposal. The Agent used the live/work mezzanine concept as an argument for alternative compliance with respect to this area as well.

The Agent stated that using ladders to access upper areas of libraries is quite common. He argued that the design of Stair C and the raised platform area above is safer than trying to access books from a rolling ladder, which is usually the case in private libraries.

On the issue of fire safety, the Agent argued that the cottage is safe. He noted that it is the only cottage in the area that is sprinklered and equipped with a fire alarm system. These features would greatly enhance the safety of occupants that had to negotiate the subject stairs in an emergency situation. The Agent asserted that the provision of a sprinkler system and a fire alarm system adequately compensate for the above referenced Code variations.

The Agent concluded that the cottage has been functioning well since it has been occupied. He stated that any of the Code issues raised by the municipality have not caused any safety problems, nor have they impaired the owners use and enjoyment of the cottage.

6. Respondent's Position

At the outset, the Respondent stated that the building permit issued in 1992 did not include a functional upper level for the tower. Besides, they were not given full access to the cottage for inspection purposes until late in construction.

The Respondent indicated that they are not sure wether the cottage will be turned into a year round residence or would continue to be used simply as a seasonal dwelling. If it did become a year round building the chances of an accident occurring on the stairs, etc. would increase greatly, he stated.

The Respondent did not addressed the specific provisions of the Code as they pertained to each of the stairs, handrails and guards. Instead, he mentioned that the report he submitted to the Commission covered his concerns.

The Respondent concluded by stating that, in his view, compliance with the Code was not achieved in numerous areas with respect to the subject stairs, handrails and guards.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-built stairs, handrails and guards do not provide sufficiency of compliance with Sentences 9.8.2.1.(1), 9.8.3.1.(1) and 9.8.3.3.(2), Article 9.8.5.2., Sentences 9.8.5.3.(1) and (2), Clause 9.8.7.1.(1)(a), Articles 9.8.7.2. and 9.8.7.6., Sentence 9.8.8.2.(5) and Article 9.8.8.4. of the 1990 Ontario Building Code at the Lundy Cottage, Cranberry Cove Fire Route, Hamer Bay, Lake Joseph, Sequin Township, Ontario.

8. Reason/s

i. The deficiencies itemized above represent, in most cases, significant deviations from Code requirements.

ii. The sprinkler and fire alarm systems are excellent safety features in an emergency situation, however, they do not compensate for the present stair, handrail and guard deficiencies during the course of their everyday, normal usage.

iii. No compensating measures relating to the use of the stairs was proposed.

BCC Ruling No. 00-39-771

BUILDING CODE COMMISSION DECISION ON B.C.C. #00-39-771

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Sentence 3.1.5.22.(2), Clauses 3.2.4.8.(2)(b) and 3.2.4.11.(2)(b), Sentence 3.2.4.16.(1) and Article 3.3.1.7. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Paul Munro, President, Cornerstone Builders Limited, Belleville, Ontario, for the resolution of a dispute with Mr. Dan Mousseau, Chief Building Official, City of Burlington, Ontario, to determine whether the as-constructed building, which does not provide protection on a floor area with a barrier-free path of travel, which has a combustible canopy and which does not offer a separate heat detection system, provides sufficiency of compliance with Article 3.3.1.7., Sentence 3.1.5.22.(2) and Clause 3.2.4.11.(2)(b) respectively of the Ontario Building Code at 2109 Lakeshore Road, Burlington, Ontario.

Mr. Brad Swainsbury
Building Inspector
City of Burlington
Designate for the Respondent

RULING

1. The Applicant

Mr. Paul Munro, President, Cornerstone Builders Limited, Belleville, Ontario, has received a building permit under the Building Code Act, 1992 and has recently constructed a residential condominium building known as the Martha Street Apartments at 2109 Lakeshore Road, Burlington, Ontario.

2. Description of Construction

The building in dispute is a new building classified as having a major occupancy of Group C - residential. It also includes an ancillary Group A, Division 2 assembly occupancy located on the ground floor. The L-shaped structure is described as five storeys in building height and has a building area of 880 m2. The building was constructed in accordance with the requirements of Article 3.2.2.43. and consists of noncombustible construction and is equipped with a fire alarm system, a standpipe and hose system and a noncompliant electrically supervised sprinkler system (see below).

The building is intended as a condominium for elderly persons. As a result, there are no kitchen facilities in the suites and the dining facilities are located on the ground floor. The building is supervised 24 hours a day, seven days a week.

The construction in dispute varies depending on whether the building is considered to be sprinklered. This situation arises because while there is a sprinkler system installed throughout the building, certain aspects of its design (discussed below) do not comply with the OBC. The following represents differing descriptions of the construction in dispute based on the building being either an unsprinklered or sprinklered facility.

As an unsprinklered building, the construction in dispute would involve three areas.

The first is the lack protection on floor areas with a barrier-free path of travel. Since the building is new construction, a barrier-free path of travel has been provided on every floor served by an elevator. The protection of this path of travel can be accomplished in several ways; providing a protected elevator, or areas of refuge or a Code conforming sprinkler system. These areas of refuge may be provided as zones within the building that are protected by separations having a certain fire- resistance rating or on the balconies of suites. However, because the structure does not conform to the elevator requirements in Sentence 3.3.1.7.(1), and currently does not have any areas of refuge, and nor does the sprinkler system comply with Code, the barrier-free path of travel is not protected.

The second area of dispute would be the two canopies or marquees that have been constructed on the exterior of the building over its main entrances, one on the north and one on the south. Both marquees are of combustible materials and project more than 1.2 m from the exterior exposing face of the building. Moreover, the windows above and around the marquees have not been protected by wired glass.

The third area of dispute would be the lack of a separate heat detection system. Currently, the provision of heat detection is being provided through the noncompliant sprinkler system. (A separate heat detection system can be waived according to Article 3.2.4.15. if the building is equipped with an electrically supervised sprinkler system designed and installed as per Code.)

If the building is sprinklered, on the other hand, the construction in dispute would involve, among other things, the sprinkler system the Applicant has installed throughout the building. Specifically, the dispute regarding the sprinkler system is the fact that it was not equipped with waterflow detection devices per floor. Instead, there is only a single waterflow detection device that serves the entire building.

Related to this, is that the sprinkler system, lacking waterflow detection devices, cannot provide separate zone indication on the fire alarm system's annunciator panel. However, in order to achieve separate zone indication on the annunciator panel as well as provide additional early warning to residents and the fire department, the Applicant has extended the interconnected smoke detection system required in other parts of the building (per 3.2.4.11.(1)) into the resident suites. The provision of these smoke detectors are in addition to the smoke alarms that have been installed in the suites in accordance with Article 3.2.4.21.

As well, neither marquee has been equipped with sprinkler protection either inside or underneath.

3. Dispute

From a Building Code perspective the issues at dispute also depend on whether the building is considered as sprinklered or unsprinklered. According to OBC 3.2.2.43., the structure can be built either with or without a sprinkler system. In the case at hand, the building has been equipped with a sprinkler system, albeit one that is not fully compliant with the OBC. Scenarios articulating the issues concerning the building both as an unsprinklered and sprinklered facility will be presented below. This is followed by a determination by the Commission as to the dispute(s) it sees before it.

Again, assuming at first that the building is unsprinklered, the issues are whether the as-constructed building, which does not provide protection on floor areas with a barrier-free path of travel, which has a combustible canopy and which does not offer a separate heat detection system, provides sufficiency of compliance with Article 3.3.1.7., Sentence 3.1.5.22.(2) and Clause 3.2.4.11.(2)(b) respectively of the Ontario Building Code.

The first provision, Article 3.3.1.7., "Protection on Floor Areas with a Barrier-Free Path of Travel", sets out the requirements for fire safety on floors that have a barrier-free path of travel. Sentence (1) of this Article stipulates that every floor with a barrier-free path of travel above or below the ground floor shall either be provided with a protected elevator described in that Article, or divided into at least two fire separated zones, i.e., areas of refuge. Sentence (2) allows buildings with residential occupancies to waive the requirements of Sentence (1) if balconies that can be used as areas of refuge are built. As well, Sentence (3) permits that both the requirements of Sentences (1) and (2) can be waived if the building is sprinklered. The building in dispute is not equipped with the prescribed protected elevator, nor is it designed to include areas of refuge on each floor area or on the balconies, and it is also not considered to be sprinklered as per the OBC. As a result, compliance is not achieved with any of the options in Sentences (1), (2) and (3).

Sentence 3.1.5.22.(2) permits combustible marquees of a certain size to be attached to the exterior of buildings that are required to be of noncombustible construction as long as every opening in the exposed wall within 4.5 m horizontally and 9 m vertically above the marquee is protected with wired glass as per the Supplementary Guidelines. Since the window openings in the north and south walls near the marquees are not protected in this fashion, the marquees, as constructed, do not conform with Code. Sentence 3.1.5.22.(3) provides an exemption to the window protection requirements of Sentence (2) if the building is sprinklered. However, the sprinkler system has not been extended to the marquees and even if it were, due to the nonconformance of the sprinkler system, this requirement could not be waived.

The last provision, Clause 3.2.4.11.(2)(b), sets out the requirements for a separate heat detection system. This provision stipulates that if a fire alarm system is required, then heat detectors must be installed in every suite and rooms located in all other areas not within the suites in a Group C building higher than three storeys. The exception to this requirement is found in Article 3.2.4.15. which states that if the building has been sprinklered, a separate heat detection system is not required. This relaxation is allowed because in order to actuate, the performance of a sprinkler system relies on detecting heat. Again, without a Code conforming sprinkler system the relaxation found in Article 3.2.4.15. for a heat

detection system is not applicable.

If the building is sprinklered, the issues are then whether the as-installed sprinkler system, which does not include waterflow detection devices nor the capacity for zoned indication on the annunciator panel, and whether the unsprinklered canopy provide sufficiency of compliance with Sentence 3.2.4.16.(1), Clause 3.2.4.8.(2)(b) and Sentence 3.2.5.13.(1) of the OBC.

Sentence 3.2.4.16.(1) is the provision that sets out the requirements for water flow detection devices. It states they must be installed as part of a sprinkler system, and if an annunciator is required, that the devices perform so as to indicate certain zones of the sprinkler system. Clauses (a) and (b) set out the area limits for the zoned coverage of the sprinkler system through the use of the waterflow devices. In the subject building, a waterflow detection device is required per floor since the floor areas do not exceed the area limits as specified in NFPA 13 (which is referenced in Sentence 3.2.4.16.(1)). These devices allow a sprinkler system to indicate where fire is detected. As mentioned, only a single waterflow detection device serves the entire building.

Related to this is how the sprinkler system, lacking waterflow detection devices, works with the fire alarm system, in particular the requirement for separate zone indication on the annunciator panel. As the building is required by Articles 3.2.4.1. and 3.2.4.8. to have a fire alarm system with an annunciator panel, the actuation of the sprinkler system (required or not) and with it the alarm system, must provide separate zone indication on the annunciator panel.

With respect to annunciator and zone indication requirements, these are addressed by Article 3.2.4.8. Sentence (1) of which stipulates, with a few exceptions that are not applicable here, that as part of a fire alarm system, an annunciator panel be installed in a specified location within a building. Sentence (2) mandates that the annunciator shall provide separate zone indication determining the area in which the fire alarm has been actuated. Clauses (a) and (b) of Sentence (2) then follow by setting out the size of floor area that may be covered by a zone in unsprinklered and sprinklered buildings respectively. In either case, sprinklered or unsprinklered, since the floor areas in Subclauses (a)(ii) and (b)(ii) are larger than the individual floor areas of the subject building, the zone indication provided must be per storey as in either Subclause (a)(i) or (b)(i). (It should be noted that the area limits set out in Clause (2)(b) are identical to those for sprinkler zone coverage mandated through the use of waterflow detection devices in Sentence 3.2.4.16.(1).) Without the waterflow detection devices, the sprinkler system in the disputed building, when activated, is not able to provide separate zone (or floor by floor) indication on the fire alarm system's annunciator panel.

Sentence 3.2.5.13.(1) states that sprinkler systems must meet NFPA 13, the "Standard for the Installation of Sprinkler Systems". This Standard, specifically Sentence 4-13.7, addresses "Exterior Roofs and Canopies" and mandates that sprinklers must be installed on the underside of exterior combustible roofs and canopies that project more than 1.2 m. In addition, NFPA 4-13.1.1. requires that all concealed spaces including the exterior combustible canopies be sprinklered, i.e. a canopy must be sprinklered on the interior as well. Since both canopies are combustible and extend more than 1.2 m from the building's exterior face, they lack sprinkler protection on both on the interior and the underside of the exterior.

Having described the various issues, the Commission's approach to them must now be discussed.

It is noted that at the outset the Applicant appealed the commission seeking a ruling on the sufficiency of compliance of his alternative sprinkler system with the requirements for sprinklering found in the OBC. There are two considerations for the Commission here. The first is to determine the nature of this sufficiency of compliance application, i.e., whether the construction in dispute should be seen as an alternative to OBC standards or rather as deficient in terms of those requirements. The second is to determine the focus of the technical dispute.

On the first consideration, we view the sufficiency of compliance question in respect of the disputed construction as one of perceived deficiency. In our opinion, it is clear that without the waterflow detection devices to service each floor separately and the ability to provide independent zone indication on the annunciator panel, the as-installed sprinkler system fails to comply with Sentences 3.2.4.16.(1) and 3.2.4.8.(2). Moreover, the design of the installed system seems more consistent with earlier versions of the OBC, which did not require waterflow detection devices when installing sprinklers in this type of structure.

Regarding the focus of the technical dispute, the Commission believes that the sprinkler system is not the principle issue. We take this position because the Building Code permits the subject building to be constructed either with or without a sprinkler system. And if a sprinkler system is installed (even if not required) then the building is allowed to benefit from certain reductions in the construction standards elsewhere in the building. In the present case, for example, a protected elevator or areas of refuge would not be required if a Code compliant sprinkler system was installed in the building. This relaxation of certain construction standards through the provision of sprinklering applies whether the building is required to be sprinklered or is being done so voluntarily. Of paramount importance, however, in order to qualify for such reductions is that the sprinkler system offered must meet Code. Because the sprinkler system is in fact deficient, according to Code, the building should therefore not enjoy the various permitted relaxations.

On this point, the Commission would like to emphasize the words of the Housing Development and Building Branch's Technical Background Information memo submitted respecting this case.

> The more fundamental issue that must be addressed prior to any discussions of compliance with Code provisions, is that all building systems must be capable of performing their functions in an expected manner and do not mislead or give a false sense of security to the current and future users as well as to the emergency response teams. Existence of a building system, such as a fire alarm or sprinkler system, naturally triggers an expectation that the system performs according to the Building Code provisions. Over the life time of the building, this assumption plays a constant role in most of the decisions made related to the building. Therefore, unlike previous editions of the OBC, the current Code reflects the concern in appropriate provisions by using phrases such as "where...system is installed,..." rather than stating "where...system is required,..."

As a result, the Commission must regard the building as if it did not benefit from sprinkler protection. Accordingly, the alleged deficiencies for an unsprinklered building have been identified. They are; the lack of the protection on floor areas with a barrier-free path of travel, the combustible canopies and the lack of a separate heat detection system.

With these perceived deficiencies in mind the Commission must then turn its attention to the compensating measures being offered. This brings us to the sprinkler system which is not a requirement in this building and can thus be offered as compensation. However, as discussed above, the sprinkler system too has deficiencies. Nevertheless, in the opinion of the BCC, if the disputed building is regarded as unsprinklered, the as-constructed sprinkler system can be viewed as a compensating measure for the supposed deficiencies therein. As well, the Commission must consider the Applicant's argument that the noncompliant sprinkler system provides a heat detection function and that the extension of the smoke detection system into the resident suites provides separate zone indication on the annunciator panel.

Therefore, the question before the Commission then is whether the said building, regarded as not benefiting from sprinkler protection and with certain alleged deficiencies, that is being compensated by, among other things, an installed yet deficient sprinkler system, achieves sufficiency of compliance with the relevant provisions of the Ontario Building Code at 2109 Lakeshore Road, Burlington, Ontario.

4. Provisions of the Ontario Building Code

Article 3.1.5.22. Canopies Having Combustible Elements

(2) Except as permitted in Sentence (3), exterior marquees, not greater than 7.5 m (24 ft 7 in) from ground level to the top of the marquee, having combustible elements other than fabrics or films conforming to Sentence are permitted on a building required to be of noncombustible construction, provided every opening in the exposed wall of the building above the marquee is protected with wired glass in accordance with the Supplementary Guidelines where these openings are within

a. 4.5 m (14 ft 9 in) horizontally of the marquee, and
b. 9 m (29 ft 6 in) vertically above the marquee.

(3) The protection required by Sentence (2) is permitted to be waived if the building is sprinklered.

Article 3.2.4.8. Annunciator and Zone Indication

(1) Except as permitted in Sentences (3) to (5), an annunciator shall be installed in close proximity to a building entrance that faces a street or an access route for fire department vehicles that complies with Sentence 3.2.5.5.(1).

(2) Except as permitted by Sentence (6), the annunciator required by Sentence (1) shall have separate zone indication and of the actuation of the alarm initiating devices in each,

a. floor area so that in a building that is not sprinklered, the area of coverage for each zone is neither more than
   i. one storey, nor
   ii. 2 000 m2 (21,500 m2),

b. floor area so that in a building that is sprinklered, the area of coverage for each zone is neither more than
   i. one storey, nor
   ii. the system area limits as specified in NFPA 13, Standard for the Installation of Sprinkler Systems

Clause 3.2.4.11. Smoke and Heat Detectors

(2) Except as provided in Article 3.2.4.15, if a fire alarm system is required, heat detectors shall be installed in

a.
b. except in a hotel, in every suite, and every room not located within a suite, in portions of buildings classified as Group C major occupancy and more than 3 storeys in building height, and

Article 3.2.4.16. System Monitoring

(1) An automatic sprinkler system shall be equipped with waterflow detecting devices and, if an annunciator is required by Article 3.2.4.8., shall be installed so that each device serves

a. not more than one storey, and
b. an area on each storey that is not more than the system area limits as specified in NFPA 13, "Standard for the Installation of Sprinkler Systems".

(2) Waterflow detecting devices required by Sentence (1) shall be connected to initiate an alert signal or an alarm signal on the fire alarm system if a fire alarm is provided.

Sentence 3.2.5.13. Automatic Sprinkler Systems

(1) Except as permitted by Sentences (2), (3) and (4), an automatic sprinkler system shall be designed, constructed, installed and tested in conformance with NFPA 13, Standard for the Installation of Sprinkler Systems . (See Appendix A.)

Article 3.3.1.7. Protection on Floor Areas with a Barrier-Free Path of Travel

(1) Except as provided in Sentences (2) and (3), every floor area above or below the first storey that has a barrier-free path of travel shall

a. be served by an elevator
   i. conforming to Sentences 3.2.6.9.(4) to (6),
   ii. protected against fire in conformance with Clauses 3.2.6.9.(3)(b) or (c), and
   iii. in a building over 3 storeys in building height, protected against smoke movement so that the hoistway will not contain more than 1% by volume of contaminated air from a fire floor during a period of 2 h after the start of a fire, assuming an outdoor temperature equal to the January design temperature on a 2.5% basis determined in conformance with Subsection 2.5.1., or

b. be divided into at least 2 zones by fire separations conforming to Sentences (4), (5) and (6) so that
   i. persons with physical disabilities can be accommodated in each zone,
   ii. the travel distance from any point in one zone to a doorway leading to another zone shall be not more than the value for travel distance permitted by Sentence 3.4.2.5.(1) for the occupancy classification of the zone, and
   iii. a barrier-free path of travel is provided to an exit. (See Appendix A.)

(2) In residential occupancies, the requirements of Sentence (1) are waived if a balcony conforming to Sentence (7) is provided for each suite, except for suites on the storey containing the barrier-free entrance described in Article 3.8.1.2.

(3) The requirements of Sentences (1) and (2) are waived when the building is sprinklered.

5. Applicant's Position

The Agent for the Applicant submitted that the subject sprinkler system was installed in the condominium on a voluntary basis to provide extra protection, as it was not required by the Ontario Building Code. However, he noted that the sprinkler system is not equipped with waterflow detecting devices that serve each storey and initiate an alarm as required by the new and revised Code Article 3.2.4.16. Nevertheless, he argued that as the building stands, it provides a higher level of life safety than that required by Code. An active suppression system, even one that does not conform to the letter of the OBC, is superior than a passive heat and smoke detection system as is required. He stated that if this application was made a few years ago, the owner would be applauded for voluntary sprinklering. However, due to the higher Code requirements of Article 3.2.4.16, there is no distinguishment between voluntary or required sprinklering.

The Agent indicated that they had originally approached the municipality regarding the sprinklering issue using Section 2.7 "Equivalents", of the OBC and argued that the as-built system was as good, if not better than that required by Code. The municipality, he stated, supported the voluntary installation of the sprinkler system, but because of the wording of the OBC provisions could not accept it. The Agent then noted that their appeal of this dispute to the BCC as a sufficiency of compliance argument is similar. It is based on the view that their system is superior and should be seen not as deficient but rather as an alternative method of conformance.

The Agent continued by noting that Article 3.2.2.43., under which the building was reviewed, allows the structure to be unsprinklered and that the size of the building is considerably under the threshold for required sprinklering. He added that the ground floor has a common dining area, but he asserted that it is not an Group A occupancy. Even if it were, only that floor would have to be sprinklered and the remainder of the building can still be viewed as being voluntarily sprinklered.

The Agent then discussed an email he had received from Alistair Aikman at the National Research

Council. The email, he stated, offered that with the expansion of sprinkler use into more buildings, the NRC realized there was concern about their reliability and the possibility of water damage. As a response, certain Code (NBC) changes were made such as "full electrical supervision of the sprinkler system by means of a fire alarm system" and "by requiring storey by storey zoning with waterflow switches for each zoned storey." Based on this, the Agent argued that the disputed waterflow detection devices became a requirement, in part, because of concerns for property damage. He insisted that the subject systems within the building, the voluntary sprinkler system and the enhanced early warning capacity, are designed more so to provide greater safety for the occupants than to protect property.

The Agent then asked the Commission which type of suite they would prefer to see their family members in - one that complies with the Code and offers no sprinklering and no in-suite smoke detection, or their's which provides additional early warning with the smoke detectors and suppression through the sprinkler system. He stated that a negative ruling by the Commission may send the wrong message to developers who may want to voluntarily sprinkler a building. He then noted that unfortunately one way to conform with the OBC would be to cap the sprinkler system, but he expressed hoped that a BCC decision would not force him to do so.

Regarding the use of smoke detectors in the suites in lieu of heat detectors as required by Clause 3.2.4.11.(2)(b), the Agent indicated that the smoke detectors are wired to the annunciator panel and provide zoned indication. As well, the smoke detection system as a whole actuates faster in a fire situation than heat detectors, thereby making them safer. As a result, the Agent argued that their system fully conforms with the early warning system requirements in the OBC.

The Agent then noted that there are other minor issues to be resolved in the building such as the requirement under OBC 3.2.5.13. and its reference to NFPA 13 (specifically Article 4-13.7.1.) which mandates that the canopies be sprinklered and whether the combustible construction in the marquees is acceptable according to Article 3.1.5.22. He stated, however, that he felt these issues are contingent on the ruling of the sprinklering issue.

Lastly, the Agent itemized what he felt were other safety factors inherent in the building. For example, he noted that the building is to have full 24 hours supervision and that since there will be no kitchens in the resident suites the risk of fire has been dramatically reduced. He also indicated that the parking available at the building is quite limited. It was kept low by the municipality during site plan approval. The net result of this, however, is that there would be little chance that the building could be easily converted into a condominium catering to all ages due to the higher parking requirements.

In summation, the Agent noted that their sprinkler system is not deficient, it is different and superior. And that the subject building is not required to be sprinkled, but was done so above and beyond what is mandated by the OBC its fire safety requirements.

6. Respondent's Position

?The Designate for the Respondent submitted that the building was reviewed under Article 3.2.2.43. as a sprinklered structure. The Code, he noted, does not differentiate between voluntary and required sprinklers, it sets standards for installed sprinklers as is the present case. On this basis, he stated that the building has various deficiencies. Primary among these is the omission of waterflow detection devices and their annunciator connections that allow for zoned indication in accordance with OBC 3.2.4.16.(1) and 3.2.4.8.(2)(b) respectively. In addition, the marquees, which are combustible and project more than 1.2 m from the exposing building faces, have not been sprinklered in conformance with Sentence 3.2.5.13.(1) and NFPA 13.

In his view, the as-built early warning system does not provide sufficiency of compliance with Code. He argued that the combination of having both smoke alarms and smoke detectors in suites in lieu of smoke alarms and heat detectors is not what the Code intends. Since smoke detectors have different capacities than smoke alarms and heat detectors, their use in the present instance may not be appropriate. In fact, the Designate argued that by having a smoke sensitive device in suites that activates a general alarm in the building and alerts the fire department (unlike smoke alarms) the tendency to create what he called a "cry wolf" syndrome is high.

The Designate summarized his position by stating that if the building is to be considered as sprinklered, the sprinkler system must meet the OBC and NFPA. As a result, properly installed waterflow devices on each floor which are connected to an addressable annunciator panel are required, as is sprinkler coverage for the marquees.

For these reasons, the Respondent indicated that he felt that he did not have the authority to allow the disputed construction.

In conclusion, the Designate stated that he hoped the Commission could find some way to allow the sprinkler system to remain but yet meet Code.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-constructed building, which does not provide protection on a floor areas with a barrier-free path of travel, which has a combustible canopy and which does not offer a separate heat detection system, provides sufficiency of compliance with Article 3.3.1.7., Sentence 3.1.5.22.(2) and Clause 3.2.4.11.(2)(b) respectively of the Ontario Building Code on the condition that:

a. The as-installed smoke detectors are removed and replaced with multi sensor detectors; and,
b. The marquees are sprinklered according to NFPA 13.

8. Reasons

i. The building, as constructed, with a sprinkler system that does not contain waterflow detections per floor does offer an improvement in life safety in comparison to a building with no sprinkler protection.
ii. The building is fully sprinklered and this system can serve to compensate for the lack of protection on floor areas that have a barrier-free path of travel.
iii. The replacement of the smoke detectors with multi sensor detectors will improve the building's detection system and will provide not only a separate heat detection system, but will retain the extension of the smoke detection system into the resident suites undertaken by the Applicant.
iv. Zoned indication will be provided on the annunciator panel through this multi sensor detection system.
v. By fulfilling condition "b" above, the marquees will conform with OBC requirements.
vi. Staffing at the building will provide full supervision.
vii. There will be no kitchens in the residents suites.
viii. The parking at the site is well below what a general public condominium would require.

Dated at Toronto this **10th,** day in the month of **August** in the year **2000** for application number **2000-45**.

BCC Ruling No. 00-38-770

BUILDING CODE COMMISSION DECISION ON B.C.C. # 00-38-770

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Articles 1.1.3.2. and 3.3.2.12 of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the ?Ontario Building Code?).

AND IN THE MATTER OF an application by Mr. Franco Lora, Project Coordinator, City of Toronto, Economic Development, Culture & Tourism, Toronto, Ontario, for the resolution of a dispute with Mr. Yaman Uzumeri, Chief Building Official, City of Toronto, Ontario, to determine whether the proposed elevated platform should be considered a stage and must therefore comply with Article 3.3.2.12. of the Ontario Building Code at the Lakeshore Grounds Assembly Hall, 3121 Lakeshore Blvd. West, Toronto, Ontario.

Agent for the Applicant

Mr. Sait Toprak
Manager, Plan Examination
City of Toronto
Designate for the Respondent

RULING

1. The Applicant

Mr. Franco Lora, Project Coordinator, City of Toronto, Economic Development, Culture & Tourism, Toronto, Ontario, has received a building permit under the Building Code Act, 1992 and is currently constructing an addition onto, and renovating the interior of, a facility known as the Lakeshore Grounds Assembly Hall, 3121 Lakeshore Blvd. West, Toronto, Ontario.

2. Description of Construction

The building at issue is an existing community centre that is described as two storeys in building height, 740 m2 in building area, facing one street and is of combustible construction. (The new construction will be of noncombustible material.) The existing structure contained meeting rooms for a variety of purposes and a multipurpose room and was classified as having a Group A - Division 2 major occupancy. As part of the renovations currently underway, the multipurpose room is being converted into a multiuse assembly hall that can accommodate dances, lectures and theatrical events. This portion of the building is classified as having a Group A - Division 1 occupancy.

The completed facility will be equipped with a sprinkler system and a single stage fire alarm system.

The construction in dispute involves the renovation of the multipurpose assembly hall, specifically the proposed addition of a raised platform to be constructed at the south end of the hall. This platform will serve as the area upon which theatrical performances, lectures and speeches will occur. To enhance the viewing of these activities on the platform, telescopic seating is proposed to be installed in approximately the northern half of the hall facing the platform. The platform area is 78.5 m2, the curtain area (at 6.6 m in width and 4.5 m in height) is approximately 30 m2 and the ceiling height is 6 m, as measured from the platform. It does not include a fly tower above nor a backstage area. As well, the platform area, as is the case for the rest of the building, will be sprinklered, but the Applicant does not intend to equip the proscenium opening with a fire curtain nor a sprinkler deluge system.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed elevated platform should be considered a stage and must therefore comply with Article 3.3.2.12. of the Ontario Building Code.

This provision sets out certain fire safety requirements for stages used for theatrical performances that address the greater hazard associated with the production of theatrical performances such as increased fire load and overhead lighting. It includes requirements to sprinkler the stage (Sentence (1)), to provide a 1 hour fire separation between the stage and its ancillary spaces (Sentence (2)), to provide a 1 hour separation between the stage (including ancillary spaces) and the seating area and, to maintain this separation at the proscenium opening, to install a fire curtain or a sprinkler deluge system (Sentence (3)), and to provide at least two vents (Sentence (5)). These provisions, however, obviously only apply when a stage is involved. In order to ascertain if the requirements of Article 3.3.2.12. apply, it must be determined whether the raised platform is a stage.

4. Provisions of the Ontario Building Code

Article 1.1.3.2. Defined Terms - Stage

Stage means a space designed primarily for theatrical performances with provision for quick change scenery and overhead lighting, including environmental control for a wide range of lighting and sound effects and which is traditionally, but not necessarily, separated from the audience by a proscenium wall and curtain opening.

Article 3.3.2.12. Stages for Theatrical Performances

1. A stage for theatrical performances and ancillary spaces, including workshops, dressing rooms and storage areas, shall be sprinklered.
2. A fire separation with a fire-resistance rating not less than 1 h shall be provided between a stage for theatrical performances and ancillary spaces, including workshops, dressing rooms and storage areas.
3. Except as permitted by Sentence (6), a stage for theatrical performances and ancillary spaces, including workshops, dressing rooms and storage areas, shall be separated from the seating area by a fire separation having a fire-resistance rating not less than 1 h, except for a proscenium opening protected with
    a. a sprinkler deluge system conforming to the requirements of NFPA 13 ?Standard for the Installation of Sprinkler Systems?,
    b. an unframed fire curtain if the opening is not more than 20 m (65 ft 7 in) wide, or
    c. a semi-rigid fire curtain if the opening is more than 20 m (65 ft 7 in) wide.
4. A fire curtain required by Sentence (3) shall be of a type designed to close
    a. automatically upon the actuation of the sprinkler system,
    b. automatically upon actuation of the fire alarm system,
    c. manually by remote control devices located at the curtain control panel and at each side of the stage, and
    d. automatically by heat-actuated devices.

5. At least 2 vents for the purpose of venting fire and smoke to the outside of a building shall be provided above a stage designed for theatrical performances and shall
    a. have an aggregate area not less than one eighth of the area of the stage behind the proscenium opening, and
    b. be arranged to open automatically upon actuation of the sprinkler system.
    c. The fire separation referred to in Sentence (3) is not required between a stage and a seating area in a floor area that is sprinklered, provided a sprinkler deluge system is installed at the boundary between the stage and the seating area.

5. Applicant's Position

The Agent for the Applicant submitted that the proposed raised platform does not meet the definition of stage as set out in the OBC. He argued that the platform is simply an elevated area that is to be used as the focal point of the room and is raised to enhance the viewing of activities that will occur in the hall. He noted that the platform does not have a fly tower nor a backstage area. Moreover, since at least approximately 85 percent of the platform is visible form the seating area there is also very little in the way of wing space at the sides of the platform. Because of these limitations, the facility is not capable of accommodating productions that include large moveable scenery that may have a high combustible load.

The Agent then stated that Article 3.3.2.12. and its stage requirements, in his view, is intended to apply to large theatres such as the Princess of Wales Theatre in Toronto and others of its size. As he argued, OBC 3.3.2.12. deals with large stages that have the capacity for quick change scenery for which a fly tower is necessary. Such theatres also have large combustible loads, are equipped with sophisticated lighting systems and they are able to produce many complicated visual effects. This is not the case with the subject building, the Agent noted.

The Agent continued by stating that the hall is a multipurpose space and is not specifically designed for theatre productions. He noted that the seating can be folded up and the space can be used for athletic activities like fitness classes or for weddings, etc. The hall, the Agent added, is ?reminiscent of a high school (auditorium) stage or a gymnasium with a stage?, or even a raised sanctuary in a church. Larger theatres, on the other hand, are not multipurpose as such and are designed specifically for musicals and full-sized stage shows which have greater potential for higher fire risk. Accordingly, facilities that specialize in large theatrical productions must be built to higher building standards to reflect the level of associated hazard. The OBC, in particular Article 3.3.2.12., addresses this.

The key, however, is knowing how to differentiate between a stage and a raised platform and when to apply Article 3.3.2.12., the Agent stated. And to differentiate requires a certain level of judgement of Code requirements based on the circumstances at hand. It is because of the requirement to make a judgement, the Agent argued, that there are many facilities across the City and the Province that have a ?stage?-like platform but have not been required to meet OBC 3.3.2.12. To require this in the building at hand would be onerous.

The Agent then discussed NFPA 101, the ?Life Safety Code? standard, as a means by which some light might be shed on this situation. This standard, he indicated, separates stages into two main categories; legitimate stages where the height from the stage surface to the ceiling above it is more than 15.2 m (50 ft), and regular stages where the height is less than 15.2 m (50 ft). This standard provides higher requirements for legitimate stages than for regular stages. The requirements for legitimate stages are more in line with those in Article 3.3.2.12., he noted. Thus, since the ?stage? to ceiling height is 6 m, he asserted that the hall should not be considered a legitimate stage subject to higher construction standards.

The building, especially the hall, is receiving some physical improvements as a result of the renovation work they are doing, the Agent indicated. For example, the ?stage? area is being equipped with a mechanical exhaust system that is capable of six air changes per hour to vent smoke. As well, two, and in some areas three, additional layers of drywall are being added to the ceiling of the platform space. Also, the building is being fully sprinklered throughout.

In response to the question that the hall provide a guarantee that it only be used as a theatre on a limited basis, the Agent stated that it should not have to offer such a restriction because the facility is not capable of accommodating bigger and potentially more dangerous productions.

In summation, the Agent reiterated his view that the platform should not be considered as a stage. It does not meet the Code?s definition as a stage, especially because it lacks the capacity for quick change scenery. Consequently, he concluded that the requirements for a stage found in Article 3.3.2.12. do not apply.

6. Respondent's Position

The Designate for the Respondent submitted that the elevated platform should be considered a stage and it should be built in conformance with Article 3.3.2.12. He then proceeded to offer some background to the present dispute.

The Designate noted that the application for permit originally came in, in part, as a change of use from an A2 general use assembly building to an A1 occupancy to be used for performing arts. It was as an A1 occupancy that the building was reviewed. This change required that the building be sprinklered because the existing building is of combustible construction, and if it were built new would be required to be of noncombustible material. As a result, however, the sprinkler system cannot be seen as a compensating measure for the items mandated in Article 3.3.2.12.

The Designate then argued that it is clear that the hall will be used primarily for staging theatrical performances. And while full scale productions cannot be housed in the space, there will certainly be productions that will involve props, thus resulting in an increased fire load. Indeed, it doesn?t matter how small the production is, the scenery can contribute to a high combustible load, he asserted. Moreover, since it is anticipated that the building will be rented out to any interested party, professional or non-professional, to use for their productions, there will be very little control over the space and its use. This could mean, the Designate argued, that the hall could be used by individuals who have little or no experience in terms of theatre fire safety. Also, there will be no control over how many times the building is used for theatrical events. As it stands, it could be used every night for such purposes and the more times it is, the greater the risk of a fire occurring.

The Designate explained that the proponents are spending a considerable amount of money to make the building conducive for performing arts, but, in his view, they are not willing to pay what is required to meet OBC 3.3.2.12.

In conclusion, the Designate expressed concern regarding the safety of the stage if the requirements of Article 3.3.2.12. are waived. He stated that as an A1 building to be used for performing arts, the stage must be separated by a one hour fire separation, except for the proscenium opening which must be protected with a deluge sprinkler or a fire curtain.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed elevated platform is not considered a stage and therefore does not need to comply with Article 3.3.2.12. of the Ontario Building Code at the Lakeshore Grounds Assembly Hall, 3121 Lakeshore Blvd. West, Toronto, Ontario.

8. Reasons

1. The construction is considered to be a raised platform in a multipurpose facility.
2. The subject platform area does not provide for quick change and storage of scenery, etc.

Dated at Toronto this **10th,** day in the month of **August** in the year **2000** for application number **2000-45**.

BCC Ruling No. 00-37-769

BUILDING CODE COMMISSION DECISION ON B.C.C. No. 00-37-769

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Clause 3.8.2.1.(1)(k) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Michael Moxam, Principal, Dunlop Farrow Architects Inc., Toronto, Ontario, for the resolution of a dispute with Mr. Mel Brown, Chief Building Official, City of Niagara Falls, Ontario, to determine whether Clause 3.8.2.1.(2)(k) of the Ontario Building Code, which permits an exemption from the requirement to provide barrier-free accessibility "within" residential suites, also applies to the design of the interior side of the egress doorways proposed for the units in the Sheraton Fallsview Hotel, Stanley Avenue and Livingstone Street, Niagara Falls, Ontario.

Designate for the Respondent

RULING

1. The Applicant

Mr. Michael Moxam, Principal, Dunlop Farrow Architects Inc., Toronto, Ontario, has received a building permit under the Building Code Act, 1992 and is constructing an addition onto the Sheraton Fallsview Hotel, Stanley and Livingstone Street, Niagara Falls, Ontario.

2. Description of Construction

The Applicant is constructing a 15 storey addition on top of an existing 24 storey hotel. The addition will create a hotel with a building height of 39 storeys and a building area of 7, 075 m2, containing Group A, Division 2 and Group C occupancies. The addition and the existing building are both of noncombustible construction and equipped with a sprinkler system, a fire alarm system and a standpipe and hose system.

The construction in dispute involves the configuration of the egress doorways within the interior of the suites of the hotel. Specifically, the issue involves the amount of clear space to be provided on the latch side of the doors in the interior of the suites. All of the doors entering the suites swing inward towards

the interior of the unit. The Respondent is requiring that a minimum 600 mm clearance be included between the latch side of the door and the demising wall that runs perpendicular to the corridor wall, thereby assisting in the barrier-free path of travel from the interior of the suite to the corridor.

The Applicant maintains that there is no basis for requiring this measurement of clearance adjacent to the latch side of the suite entry doors. It is suggested that a "barrier-free path of travel is not required within a residential suite (OBC 3.8.2.1.(2)(k)." In this regard, the Applicant is proposing a clearance ranging from approximately 127 mm to 711 mm between the latch side of the door and the demising wall. The clearance measurement is dependent on the design of the suite in question.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether Clause 3.8.2.1.(2)(k) of the Ontario Building Code, which permits an exemption from the requirement to provide barrier-free accessibility "within" residential suites, also applies to the design of the interior side of the egress doorways proposed for the subject hotel suites. Article 3.8.2.1. determines which areas and which buildings are required to be barrier-free and which may be exempt.

Since this provision of the OBC deals with an exemption from a specific requirement, an understanding of the requirement itself is essential. In this instance, Sentence 3.8.2.1.(1) outlines the parameters of construction. It specifies that, except under certain circumstances, a barrier-free path of travel shall be provided throughout the entrance floor and all normally occupied floor areas of a building. Sentence 3.8.2.1.(2), including Clause 3.8.2.1.(2)(k), is a series of exceptions to the provisions of Sentence 3.8.2.1.(1). Specifically, Clause (k) exempts the requirement for barrier-free travel "within a suite of residential occupancy".

If a determination is made that an area is required to be barrier-free, then certain additional construction requirements apply. In this regard, Sentence 3.8.3.3.(11) mandates the amount of clear space required beyond the latch side of a door with a closer located in a barrier-free path of travel. The requirement is a minimum of 600 mm when the door swings toward the approach side and a minimum of 300 mm when the door swings away from the approach side. This provision is intended to make it easier for individuals in wheelchairs to open a door and travel through the doorway. As noted, the Applicant intends to provide, depending on the design of the suite, clearance from 127 mm to 711 mm on the interior latch side of suite doors. In some instances, this clearance will not meet the 600 mm minimum where a door swings inward in a barrier-free path of travel.

The Code ensures accessibility into the subject hotel rooms by extending the barrier-free path of travel into residential suites. The key question, however, is whether the interior side of the suite doors, as approached from the inside in order to exit, are considered to be "within" a path or travel that is required to be barrier-free. If so, the clear space requirements of Sentence 3.8.3.3.(11) would be applicable.

4. Provisions of the Ontario Building Code

Clause 3.8.2.1. Areas Requiring Barrier-Free Path of Travel

1. Except where essential obstructions in the work area would make a barrier-free path of travel hazardous, and except as provided in Sentences (2), (3) and (4), a barrier-free path of travel from the entrances required by Sentences 3.8.1.2.(1) and (2) to be barrier-free shall be provided throughout the entrance storey and within all normally occupied floor areas served by a passenger type elevator or other platform equipped passenger elevating device.
2. The provision of a barrier-free path of travel in Sentence (1) does not apply
    j. into suites of residential occupancy that are in storeys other than the entrance storey and that have all entrance doors at floor levels that do not correspond to elevator stop levels,
    k. within a suite of residential occupancy, or

Sentence 3.8.3.3. Doorways and Doors

11. Every door equipped with a closer in a barrier-free path of travel shall have a clear space beyond the latch side of not less than
    a. 600 mm (23? in) where the door swings towards the approach side, and
    b. 300 mm (11? in) where the door swings away from the approach side.

5. Applicant's Position

The Agent for the Applicant advised that it is their intention to add several storeys to an existing 24 storey hotel, providing a total building height of 39 stories. In doing this, it is recognized that the route approaching the suites in the new portion must provide a barrier-free path of travel in accordance with OBC requirements. The additional floors have been designed in such a way that accessibility to the suites has been improved relative to the design of the existing floors.

The Agent contended that "within a guest suite, there is no basis for requiring a space next to the latch side of the suite entry doors as a barrier-free path of travel is not required within a residential suite (OBC 3.8.2.1(2)(k)." The Agent also advised that there is a prior ruling by the Building Code Commission in

respect to this same issue. The Commission found, as is the Applicant's position, that there was no requirement for a barrier-free path of travel "within" a residential suite. In this regard, the design of the suites meets the specific parameters outlined in the Code.

The Applicant went on to state that both the existing and proposed portions of the hotel are fully sprinklered and that 3 accessible rooms are provided in the existing part of hotel.

In conclusion, the Applicant acknowledged that the Code requirements are not perfect; there are some inconsistencies. He emphasized that, in this case, the current OBC requirements did not mandate the 600 mm clear distance being requested by the Respondent. If this is an appropriate requirement and whether the OBC needs to be amended is a policy question for the Housing Development and Buildings Branch of the Ministry of Municipal Affairs and Housing. It should not impact on the Commissions ruling in this instance.

6. Respondent's Position

The Designate for the Respondent submitted that Clause 3.8.2.1.(2)(j) requires a barrier-free path of travel on floors with elevator stops. A barrier-free path of travel, therefore, is required into the suites of the subject hotel. As the doorway is located in the path of travel, the Applicant is thus expected to comply with Sentence 3.8.3.3.(11) by providing 600 mm of clear space on the latch side of the door when the door swings into the unit, as is the case in this instance.

The Designate questioned why access to balconies and the doorway to at least one bathroom were required to provide enough clearance to be considered barrier-free when approached from the interior of a unit. The same standards, he suggested, should apply to the interior doorway of the suites and therefore Sentences 3.8.3.3.(10) and 3.8.3.3.(11) of the OBC are applicable.

The Designate acknowledged the Building Code Commission ruling on a similar application but questioned what, if anything, had happened as a result of the Commission's Recommendation to the Housing Development and Buildings Branch. It was recommended that the "Branch review these aspects of the Ontario Building Code to examine the possibility of amending such provisions to allow for greater ease of barrier-free egress with respect to hotels and similar use buildings that provide short term accommodation where occupants may not be familiar with their surroundings." The Designate still felt strongly that the barrier-free access provisions should apply in this instance. They are concerned that, without proper clearance, a disabled person may not be able to adequately move about or get out of one of these suites.

In conclusion, the Designate advised there are inconsistencies in the Code. It is their opinion that the interpretation of this issue could be viewed either way. In addition, the Designate emphasized that they would like to see such inconsistencies clarified, as recommended in the previous Commission ruling.

7. Commission Ruling

It is the decision of the Building Code Commission that Clause 3.8.2.1.(2)(k) of the Ontario Building Code, which permits an exemption from the requirement to provide barrier-free accessibility "within" residential suites, also applies to the design of the interior side of the egress doorways proposed for the units in the Sheraton Fallsview Hotel, Stanley Avenue and Livingstone Street, Niagara Falls, Ontario.

8. Reasons

i. Sentence 3.8.2.1.(1) specifies the floor areas that require a barrier-free path of travel. Sentences 3.8.1.2.(2), (3) and (4) provide a list of exemptions to Sentence (1). Since a barrier-free path of travel within a suite of residential occupancy in Sentence (1) is listed as one of the exemptions, the requirements of Article 3.8.3.3. would not apply.

9. Recommendation

The Building Code Commission recommends that the Housing Development and Buildings Branch review these aspects of the Ontario Building Code to examine the possibility of amending such provisions to allow for greater ease of barrier-free egress with respect to hotels and similar use buildings that provide short term accommodation where the occupants may not be familiar with their surroundings.

RULING

1. The Applicant

Mr. Robin Ng, Principal, Ng Chee Architects, Toronto, Ontario, has applied for a building permit under the Building Code Act, 1992 to extend an existing building known as the "Thorntonview Long Term Care Facility" located at 186 Thornton Road South, Oshawa, Ontario.

2. Description of Construction

The Applicant is proposing to extend an existing one-storey long term care facility by constructing a new 1581.48 m^2, two-storey structure to the rear (or north) of the present building. Both the existing and the proposed construction have a Group B, Division 2 - Care and Treatment occupancies. The buildings are and will be of combustible construction and are to be equipped with a fire alarm system. The new facility will be fully sprinklered and will be separated from the existing building by a firewall. Doors in the firewall, however, will allow intercommunication between the new structure and the existing building.

The construction in dispute involves the fact that the new structure will not face a street, nor will it be provided with a fire access route. The Applicant is, however, proposing to sprinkler the presently unsprinklered central portion of the existing building that would abut the link to the new facility.

The lack of access to the proposed building is primarily the result of the physical constrains of the site in question. The property is bordered to the east by Thornton Road South, which is the only municipal roadway adjacent to the property. (There is a fire access route to the front of the existing building connected to this road.) Between Thornton Road South and the east exposing walls of both the new and existing buildings is a very steep slope. Grading this slope to provide an access route/street to the proposed facility is, in the opinion of the Applicant, impractical. In addition, the site of the new building is bounded to the north by a flood plain, to the west by a river and to the south by the existing building, the length of which will completely preclude access to the new building.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the new sprinklered facility separated from an existing building by a firewall, but which is proposed to be constructed without facing a street for fire fighting purposes or a fire access route, provides sufficiency of compliance with Sentences 3.2.2.10.(1) and (2), Sentence 3.2.5.4.(1), and Article 3.2.5.5. of the Ontario Building Code.

The first provision, Sentence 3.2.2.10.(1), requires that every building face a street conforming to Articles 3.2.5.5. and 3.2.5.6. However, Sentence 3.2.2.10.(2) then permits, for the purposes of establishing construction requirements for buildings based on their occupancy, size and height and complying with fire fighting requirements, that a fire access route can be considered as a street if it conforms to Subsection 3.2.5. In addition, Sentence 3.2.5.4.(1) requires that buildings of a certain size also provide a fire access route directly to specific areas of a building, thus ensuring that if the structure is large enough that continuous access is provided from the street onto the property and to particular areas of the building. Sentence 3.2.5.4.(1) is a separate requirement than that of Article 3.2.2.10. and becomes applicable when a building surpasses the height and area thresholds it sets out. The subject building is of a size that it is required to both face a street and provide a fire access route.

The requirements of Article 3.2.5.5. expand upon the above concept. It details the standards to be met when determining the location of a fire access route where one is required. This Article requires that, for a building not provided with a fire department connection, a fire access route must be located between three and fifteen metres from the main entrance and other required openings of the building face. This access route must be designed in such a way that it provides an unobstructed path of travel not longer than 45 metres from the pumper vehicle to the main entrance of the building, and not longer than 90 metres measured from the fire hydrant to the main entrance of the building.

As noted, no street or access route is being proposed for the new building. In lieu of these, the Applicant is proposing to fully sprinkler the central portion of the existing building that is to abut the connecting

portion between buildings. The issue to be considered therefore is whether partial sprinklering of the existing building can sufficiently compensate for the Building Code requirements of facing a street and providing an access route.

4. Provisions of the Ontario Building Code

Sentence 3.2.2.10. Streets

1. Every building shall face a street located in conformance with the requirements of Articles 3.2.5.5. and 3.2.5.6. for access routes.
2. For the purposes of Subsections 3.2.2. and 3.2.5. an access route conforming to Subsection 3.2.5. is permitted to be considered as a street.

Sentence 3.2.5.4. Access Routes

1. A building which is more than 3 storeys in building height or more than 600 m^2 (6,460 ft^2) in building area shall be provided with access routes for fire department vehicles
    a. to the principal entrance, and
    b. to each building face having access openings for fire fighting as required by Articles 3.2.5.1. and 3.2.5.2. (See appendix A.)

Article 3.2.5.5. Location of Access Routes

1. Access routes required by Article 3.2.5.4. shall be located so that the principal entrance and every access opening required by Articles 3.2.5.1. and 3.2.5.2. are located not less than 3 m (9 ft 10 in) and not more than 15 m (49 ft 3 in) from the closest portion of the access route required for fire department use, measured horizontally from the face of the *building*.
2. Access routes shall be provided to a *building* so that
    a. for a *building* provided with a fire department connection, a fire department pumper vehicle can be located adjacent to the hydrants referred to in Article 3.2.5.16.,
    b. for a *building* not provided with a fire department connection, a fire department pumper vehicle can be located so that the length of the access route from a hydrant to the vehicle plus the unobstructed path of travel for the fire fighter from the vehicle to the *building* is not more than 90 m (295 ft 3 in), and
    c. the unobstructed path of travel for the fire fighter from the vehicle to the *building* is not more than 45 m (147 ft 8 in).

3. The unobstructed path of travel for the fire fighter required by Sentence (2) from the vehicle to the *building* shall be measured from the vehicle to the fire department connection provided for the *building*, except that if no fire department connection is provided, the path of travel shall be measured to the principal entrance of the *building*.
4. If a portion of a *building* is completely cut off from the remainder of the *building* so that there is no access to the remainder of the *building*, the access routes required by Sentence (2) shall be located so that the unobstructed path of travel from the vehicle to one entrance of each portion of the *building* is not more than 45 m (147 ft 8 in).

5. Applicant's Position

The Applicant submitted that the construction of the required street/fire access route for the new addition cannot practically be achieved in this location because of the characteristics of the site. There is a steep escarpment on one side of the building and a river and flood plain on the other. In an attempt to create an access route, the Applicant proposed that firefighter access could be provided through a heavily sprinklered area at the middle front of the existing building which would lead to the new addition.

The Applicant submitted the following arguments to demonstrate sufficiency of compliance with the requirements of the OBC:

1. It is unrealistic to expect that, if there is a fire in the proposed addition, there would be an impediment to firefighter access to the addition in the existing building.

   "The Fire Safety Plan will address the necessity of maintaining clear access between the main entrance of the existing building and the door in the fire wall (sic) separating the existing building from the addition.

2. If a fire were to occur in the existing building, it would not be reasonable to expect that a fire would occur simultaneously in the addition.
3. The allowance in OBC 3.2.5.5.(4) whereby a 45 m distance from a fire vehicle to an entrance of a portion of a building completely cut off from the remainder of the building is permitted, effectively constitutes an exception to the requirement for a maximum 15 m distance from a fire route to a main entrance which generally applies.

   "The actual distance from the door in the fire wall (sic) providing access to the addition to the fire route is less than 24 m - considerably less than the 45 m allowed in OBC 3.2.5.5.(4).

"The fact that, by virtue of the fire doors in the fire wall (sic), the addition is not 'completely cut off' from the existing building, may be appreciated as being advantageous in that direct access is provided to the addition from the vehicle and the main entrance containing the fire alarm annunciator.

"This is superior to a situation where there is a considerable distance to travel around the exterior of the building from the fire department response point to a remote entrance in a 'completely cut off' portion of the building.

4. The existing building is subdivided by fire walls (sic). The owner's representative has indicated that the central portion of the existing building containing the firefighter access route from the existing main entrance to the door to the addition may be sprinklered. Such sprinklering would cover the entire centre portion of the existing building between fire walls (sic) separating such portion from the east and west wings containing patient rooms."

6. Respondent's Position

The Respondent advised that the City welcomed the development of this project and recognized the difficulties stemming from the physical constraints on site. However, he submitted that the new structure is a separate building, and is therefore required to be provided with a fire access route in compliance with the Ontario Building Code.

The Respondent outlined that they would be content with the proposal if the new building was of noncombustible construction and if the middle front portion of the existing building was sprinklered.

7. Commission Ruling

It is the decision of the Building Code Commission that the new sprinklered facility, separated from the existing building by a firewall, but which is proposed to be constructed without a fire access route, does not provide sufficiency of compliance with Sentences 3.2.2.10.(1) and (2), Sentence 3.2.5.4.(1), and Article 3.2.5.5 of the Ontario Building Code at the Thorntonview Long Term Care Facility, 186 Thornton Road South, Oshawa, Ontario.

8. Reasons

i. The new structure is considered to be a separate building and is, therefore, required to face a street or a fire access route considered as a street in accordance with Article 3.2.2.10. In addition, due to the size of the proposed new building, at 1581.48 m^2, a fire access route from the street

and onto the property to the principal entrance and each building face having access openings for fire fighting purposes is required in conformance with Article 3.2.5.4. The subject proposal does not provide either.

ii. The proposed sprinklering and access through the existing building is not sufficient to compensate for the level of life safety that would be provided with direct access to the facility for emergency personnel as set out in the Code.

Dated at Toronto this **27th** day in the month of **July** in the year **2000** for application number **2000-44**.

Designate for the Respondent

RULING

1. The Applicant

Mr. Bert Steenburgh, General Manager, 1086891 Ontario Inc., Burlington, Ontario, has received a building permit under the Building Code Act, 1992 and has renovated an existing building, creating residential suites on the fifth floor (Units 1 to 9) at the Burlington Square Plaza Garden Apartments, 1460 Ghent Avenue, Burlington, Ontario.

2. Description of Construction

The Applicant has carried out renovations to an existing 17 storey building having a building area of 22, 275 m^2. The structure is of noncombustible construction and is equipped with a sprinkler system (in the commercial area only), a fire alarm system and a standpipe and hose system. The building, previously used for commercial purposes, now has a Group C major occupancy classification.

As part of the renovation of the building for residential purposes, the storage units located on the fifth floor of the building, have been converted into nine residential suites. Within each of these suites the bathroom has been designed to include an acrylic whirlpool bathtub. The tubs are CSA approved, however, they have not been tested under the guidelines set out in the Ontario Building Code. As a

result, it has not been determined whether the tubs meet the flame-spread rating or smoke developed classification requirements for plumbing fixtures within residential units of a high building. Based on similar testing of the acrylic material used in these tubs, it appears unlikely that the fixtures would meet all of the OBC requirements.

As compensation for the likely reduction in the performance level of the nine tubs, the Applicant is proposing to install wall-mounted sprinklers in each of the affected bathrooms.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed sprinklering of the bathrooms, offered as a compensating measure in lieu of confirmation that the whirlpool tubs meet the flame-spread rating and smoke developed classification requirements, provides sufficiency of compliance with in Articles 3.1.5.16., 3.1.13.3. and Sentence 3.1.13.7.(1) the Ontario Building Code.

As outlined in Article 3.1.5.16., combustible plumbing fixtures are permitted within a building that is required to be of noncombustible construction provided that they do not have a flame-spread rating and smoke developed classification more than the walls of the room in which they are installed. Article 3.1.13.3. specifies that the flame-spread rating for interior walls and ceilings for a residential bathroom suite shall not be more than 200.

In this instance, the acrylic whirlpool tubs have not been specifically analyzed to determine whether their flame-spread rating and smoke developed classification are in conformance with CAN/ULC-S102-M, "Standard Method of Test for Surface Burning Characteristics of Building Materials and Assemblies". It is anticipated however, that if tested, the bathtubs may fail to meet the requirements of the OBC.

Further, Sentence 3.1.13.7.(1) outlines the requirements for flame-spread rating and smoke developed classification in high buildings. As mentioned above, the building in this instance is 17 storeys in building height, however, the installed bathtub fixtures do not appear to meet the parameters outlined in Table 3.1.13.7. This table requires a maximum smoke developed classification of 300 and a maximum flame-spread rating of 200.

It may be noted that Sentence 3.1.13.7.(2) permits the smoke developed classification to exceed the maximum levels outlined in Table 3.1.13.7., for buildings not containing a Group B major occupancy, provided that the building is sprinklered and that the sprinkler system is electrically supervised.

Sprinklering is proposed as a compensating measure in this instance however, it would be limited to the bathrooms containing the whirlpool tubs. The building, with the exception of the commercial areas, is not fully sprinklered.

4. Provisions of the Ontario Building Code

Articles 3.1.5.16. Combustible Plumbing Fixtures

(1) Combustible plumbing fixtures, including wall and ceiling enclosures that form part of the plumbing fixtures, are permitted in a building required to be of noncombustible construction provided they are constructed of material having a flame-spread rating and smoke developed classification not more than that permitted for the wall surface of the room or space in which they are installed.

Article 3.1.13.3. Bathrooms in Residential Suites

(1) The flame-spread rating of interior wall and ceiling finished for a bathroom within a suite of residential occupancy shall not be more than 200.

Sentence 3.1.13.7. High Buildings

(1) Except as permitted by Sentences (2) and (3), the interior wall, ceiling and floor finishes in a building regulated by the provisions of Subsection 3.2.6. shall conform to the flame-spread rating requirements in Articles 3.1.13.2. to 3.1.13.6. and to the flame-spread rating and smoke developed classification values in Table 3.1.13.7.

5. Applicant's Position

By way of background, the Agent for the Applicant explained that, in the conversion of the storage units to residential suites, it was thought to be beneficial, from a leasing point of view, to include acrylic whirlpool bathtubs as a feature of the bathroom facilities. After the tubs were installed, it came to their intention that the Building Code requirements for combustible construction in a combustible building had changed. As a result, they proceeded to seek out information with respect to the flame

spread rating and smoke developed classification for the installed tubs. They contacted the tub manufacturer, Tomlin Industries, who provided various documentation relative to the materials used in the construction of the tub enclosures. The testing of the materials was conducted using ASTM E84 parameters. It was concluded, however, that this could not be compared or converted to measurements relative to the CAN/ULC-S102 standard required. Moreover, Tomlin Industries would not agree to undertake the specific testing required to make a determination on the standards of the tubs. In any event, it was expected that the tubs may not meet the required standards outlined in the OBC.

The Agent went on to submit that, the bathtubs in question can be used in residential suites wherever the high building standards do not apply. He acknowledge, however, that because Section 3.2.7. of the Code does come into play, the tubs do not meet the OBC requirements. Nevertheless, in lieu of these requirements he has proposed to install wall mounted sprinklers in the bathrooms containing the noncompliant tubs. This, he argued, is sufficient compensation to alleviate life safety concerns and would meet the intent of the Building Code.

6. Respondent's Position

The Designate for the Respondent submitted that the ASTM standards are different from the required CAN/ULC-S102 standard outlined in the Code. He suggested that the tubs may, in fact, meet the flame-spread requirements, however, he believes they would be far from meeting the smoke developed classification measurements.

In response to the proposed compensation offered by the sprinklering of the bathroom, the Designate argued that, if a fire were to start in one of these bathrooms, sprinklering of that area may help. If the fire started outside of the bathroom, however, it would most likely overwhelm the area. He acknowledged that the Code makes allowance for combustible fixtures in a building of noncombustible construction where sprinklering is provided, but submitted that the whole building must be sprinklered for this exception to apply. That is not the case in this instance.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed sprinklering of the affected bathrooms, offered as a compensating measure in lieu of meeting the required flame-spread rating and smoke developed classification for the whirlpool bathtubs, provides sufficiency of compliance with Articles 3.1.5.16., 3.1.13.3 and Sentence 3.1.13.7.(1) of the Ontario Building Code for Units 1 to 9 on the fifth floor, Burlington Square Plaza Garden Apartments, 1460 Ghent Avenue, Burlington, Ontario.

8. Reasons

i. The proposed sprinklering, which is not required by the Ontario Building Code, will provide a sufficient increase in the safety for the occupants of the residential units.

ii. The tubs have been tested under ASTM standards and may comply with the flame-spread requirements of the OBC.

iii. Sprinklering of the bathroom area will sufficiently compensate for the expected deficiency in compliance with the CAN/ULC-S102 standard outlined in the Code.

The Respondent

RULING

1. The Applicant

Mr. Thomas Leitz, owner, Toronto, Ontario, has applied for a building permit under the Building Code Act, 1992 to construct a new cabin as an addition to his cottage at Lot 22, Concession 6, Plan 42R-8123, Township of Seguin/Foley, Ontario.

2. Description of Construction

The Applicant is proposing to construct a new one-bedroom cabin on his property which already has a three-bedroom Group C - dwelling unit. The proposed construction will increase the number of bedrooms from three to four and the total number of fixture units from 22 to 28. As a result, the daily design sewage flow will increase from 1700 litres to 2400 litres. The total finished floor area will be 225 m2.

The Applicant is not proposing any changes or upgrades to his existing sewage system, which has been installed in 1993. The existing sewage system is described as a conventional Class 4 sewage treatment facility. It has a 4540 litre septic tank and transmits effluent to a 86 m leaching bed by gravity. The leaching bed comprises six four-inch distribution pipes.

The subject site is a cottage property with minimum slope and is covered with grass. The T-time of the native soil is reported to range between five to six minutes per centimetre. The depth to high groundwater table is six metres.

The construction in dispute involves the working capacity of the existing septic tank.

3. Dispute

The issue at dispute between the Applicant and the Respondent is whether the working capacity of the existing gravity fed septic tank provides sufficiency of compliance with Clause 8.2.2.3.(1)(a) of the Ontario Building Code (OBC). According to this Clause the working capacity of a septic tank servicing a residential occupancy must be twice the calculated daily design sanitary sewage flow for that occupancy (however, regardless of the type of occupancy and daily design sewage flow, a septic tank must in no case have a working capacity less than 3600 litres). As a result, based on calculated daily design sewage flow of 2400 litres, the required tank size for the subject dwelling is 4800 litres. The existing tank is a two compartment tank without a siphon or pump. The inside dimensions of the tank, as described by the Applicant, are 2388 mm (length) by 1523 mm (width) by 1399 mm (depth to the bottom of the outlet). The chamber divider measures as 1523 by 1399 mm with an average thickness of 63.5 mm.

Therefore, at issue is whether the volume of the existing septic tank, when considering its interior dimensions, is adequate for a working capacity of 4800 litres.

4. Provisions of the Ontario Building Code

Clause 8.2.2.3.(1) (a) Septic Tanks

1. The minimum working capacity of a septic tank shall be the greater of 3 600 L and,

    a. in residential occupancies, twice the daily design sanitary sewage flow

5. Applicant's Position

The Applicant submitted that the working capacity of the existing septic tank exceeds the working capacity attributed to it by the manufacturer.

The Applicant argued that manufacturers typically oversize their tanks to accommodate such things as pump chambers and to allow for bowing of forms and un-level tanks. The existing system is a gravity fed system and does not have a pump chamber. Besides he asserted, based on the OBC definition of working capacity (Article 1.1.3.2.) and information regarding the inside dimensions of the existing tank as provided by its manufacturer, the working capacity of the tank is calculated to be 4 953 litres instead

of 4 540 litres stamped on it. As he explained this size has been calculated by subtracting the volume of the chamber divider from the overall volume of liquid accumulated to a depth under the outlet pipe.

Based on this calculation the existing tank meets and exceeds the 4800 litres OBC size requirement for a septic tank to serve a four bedroom dwelling unit with a daily design sewage flow of 2400 litres, he concluded.

6. Respondent's Position

The Respondent submitted that she accepts the working capacity of septic tanks based on the manufacturer=s stamp. She stated that the working capacity of the tank under dispute, as indicated by the manufacturer, is 4 540 litres. If it is not, i.e., if Brooklin and other tanks tanks have a working capacity larger than labelled, installers and regulators should be informed, she argued.

The Respondent then concluded that based on manufacturer's stamp on the existing tank, the existing tank cannot handle the increased calculated flow and is required to be upgraded to an acceptable size as required by the OBC.

7. Commission Ruling

It is the decision of the Building Code Commission that the existing labelled 4 540 septic tank provides sufficiency of compliance with Clause 8.2.2.3.(1)(a) of the OBC on the condition that it is equipped with an effluent filter.

8. Reason/s

1. The required tank volume to permit the additional building is likely contained within the over-sizing of the tank by the manufacturer.
2. The addition of an effluent filter, which will remove part of the Suspended Solids and the Biological Oxygen Demand would compensate for any very small tank volume shortfall.

Dated at Toronto this **13th,** day in the month of **July** in the year **2000** for application number **2000-47**.

Designate for the Respondent

RULING

1. The Applicant

Mr. John Hyjek, R.R. #3, Oil Springs, Ontario, has applied for a building permit under the Building Code Act, 1992 to install a Class 4 sewage system at Lot #10, Concession II, County of Lambton, Ontario. Building Code Act, 1992 to construct a new cabin as an addition to his cottage at Lot 22, Concession 6, Plan 42R-8123, Township of Seguin/Foley, Ontario.

2. Description of Construction

The Applicant is proposing to install a Class 4 shallow buried trench sewage system in order to serve a Group C - residential building currently under construction. The building is described as having two bedrooms, a total of 17 fixture units, and a finished area of 126.34 m2. The calculated daily design sewage flow is 1100 litres.

The proposed system is to consist of a "Whitewater" treatment system with a capacity of 1900 litres per day, a pump chamber and a shallow buried trench system. The shallow buried trench system will consist of four runs of chambers with total length of 40 m. These chambers are to be placed on 150 to 200 mm imported sand fill with a percolation time of less than 10 minutes over a native soil with a percolation time over 125 minutes. The trench system would be covered with a layer of 250 mm pea stone or coarse sand prior to backfilling by the native topsoil. The proposed leaching bed area would be 441 m2 (21 by 21 metres) and the mantle would extend four metres from the pipe. The treated effluent is proposed to be

pumped directly from the treatment unit to the distribution pipes for final disposal. The free access sand filter component of the system, as required by the manufacturer and set out as a condition for approving the Whitewater system by the then-approval authority (the Ministry of the Environment) for soils with a percolation time between 50 to 125 minutes is not proposed.

The site is a 40-hectare farm having a minimal slope and is mostly covered with bush. The depth to bedrock or high groundwater table, as described by the Applicant, is 1.8 metres. The percolation time of the native soil is reported to be greater than 125 minutes.

The water to the site is supplied by municipal waterline.

The construction in dispute involves the proposed change in configuration of the Whitewater treatment system.

3. Dispute

The issue at dispute between the Applicant and the Respondent is whether the proposed Whitewater treatment system discharging to the proposed shallow buried trench system designed to be buried in shallow sand fill provides sufficiency of compliance with Sentence 8.6.2.2.(2) and Table 8.6.2.2.A of the OBC (Ontario Building Code).

Sentence 8.6.2.2.(2) sets out standards for the quality of the effluent that is allowed to be discharged to a shallow buried trench system. According to this provision, the effluent applied to a shallow buried trench system must not exceed the maximum concentrations given in column three of Table 8.6.2.2.A, which identifies the thresholds for the tertiary level effluent. The treatment units listed in the Supplementary Guidelines to the 1997 OBC, including the Whitewater system, are also deemed to comply with the requirements of column three of Table 8.6.2.2.A (Sentence 8.6.2.2.(5)).

Table 8.6.2.2.A.
Other Treatment Unit Effluent Quality Criteria
Forming Part of Sentence 8.6.2.2.(1), (2) and (5)

Parameter	Secondary Effluent1	Tertiary Effluent1
BOD5	40	15
CBOD5	30	10

Suspended Solids	30	10
Column 1	2	3

Note to Table 8.6.2.2.A.:
1. Maximum concentration based on 30 day averages in milligrams per litre (mg/L)

Designers/installers may either use a treatment unit that is listed and described in the Supplementary Guidelines, or a treatment unit that complies with Table 8.6.2.2.A. Where a treatment unit is selected from the Supplementary Guidelines to the 1997 OBC, the unit shall follow all the requirements specified for that unit. Otherwise, the installation shall be according to the requirements of Part 8.

As described in the Supplementary Guidelines to the 1997 Ontario Building Code, when installing a Whitewater treatment unit in soils between 50 to 125 min/cm, a single pass free access sand filter must also be installed. However, for the proposed system it appears that the Applicant is not intending to install such a sand filter according to the Supplementary Guidelines. Instead, he is proposing that the free access sand filter be replaced with a layer of sand fill placed beneath the trench system.

Another issue raised during the hearing was the requirement for a mantle as per Clause 8.7.4.2.(1)(a) that concerns the leaching bed fill proposed by the Applicant in lieu of the free access sand filter. According to this clause, if the absorption trenches of a leaching bed are constructed in leaching bed fill with a percolation time identified under Clause 8.7.2.1.(1)(b), this fill (in this case, the 150 mm sand fill with a percolation time of less than 10 minutes proposed to be placed under the shallow buried trench system) must extend at least 15 meters beyond the outer distribution pipes in direction that provides horizontal movement of the effluent entering the soil. The mantle proposed by the Applicant, extends only four meters beyond the distribution pipes.

Therefore, at issue is whether the proposed elimination of a free access sand filter and the addition of 150 mm sand fill under the shallow buried trench system would affect the sufficiency of the system in complying with the relevant provisions of the OBC.

4. Provisions of the Ontario Building Code

Sentence 8.6.2.2.(2) Other Treatment Units

1.

2. A treatment unit that is used in conjunction with a leaching bed constructed as shallow buried trenches shall be designed such that the effluent does not exceed the maximum concentrations stipulated in Column 3 of Table 8.6.2.2.A.

Clause 8.7.4.2. Construction Requirements

1. A leaching bed comprised of absorption trenches may be constructed in leaching bed fill provided that the unsaturated soil or leaching bed fill complying with Clause 8.7.2.1.(1)(b) extends

    a. ,
    b. for at least 15 m beyond the outer distribution pipes in any direction in which the effluent entering the soil will move horizontally.

Clause 8.7.2.1. General Requirements

1. A leaching bed shall not be located:

    a. ,
    b. in soil or leaching bed fill having a percolation time

        i. less than one minute, or greater than 125 minutes if constructed as a shallow buried trench, or

        ii. less than one minute, or greater than 50 minutes for all other leaching beds.

5. Applicant's Position

The Agent for the Applicant submitted that the elimination of the free access sand filter is compensated for by placing the chamber system on a layer of sand fill with a percolation time of less than 10 min/cm.

The Agent started his argument by addressing the issues raised in the Technical Background Information (TBI) report prepared by the Housing Development and Buildings Branch of the Ministry. With respect to Sentence 8.7.4.1.(1) and Table 8.7.4.1.A. (loading requirements), the Applicant argued that the loading rate of the proposed system is 2.49 L/m2/day, which is less than the loading rate of 4.0 L/m2/day permitted by the OBC for soils with a percolation time of more than 50 min/cm.

The Agent continued that the low loading rate would compensate for the mantle size, which is proposed to extend only four metres beyond the outer distribution pipes instead of the 15 metre requirement under the OBC. With a loading rate less than the maximum specified by the OBC, there should be no lateral flow that requires a full mantle, he argued. However, comments made regarding the requirement for a minimum sand fill of 250 millimetres (Clause 8.7.4.2.(1)(a)) resulted in the Agent volunteering to increase the sand fill to 250 millimetres.

The Agent also considered that with a low loading rate and partial evapotranspiration of the effluent before reaching to the subsoil, the formation of biomat and resultant clogging of the pores of the native soil is unlikely. The Agent suggested that he had reached an agreement with the County regarding the size of the mantle.

The Agent argued that the system generally used in the County of Lambton is a conventional filter bed system. This system utilizes filter media sand in the bed to treat the effluent to the secondary level. As a result, the effluent that is applied to the top of the contact area sand for the final disposal has a secondary quality. According to the proposed design, however, a tertiary level effluent will be applied to the same sand fill prior to final discharge to the environment, he emphasized.

To support his assertion, the Agent submitted lab results from the same type of system installed in Windsor that demonstrates the effluent quality. This installed system has neither a septic tank proceeding the Whitewater unit nor a free access sand filter following it. However, from the lab results, it provides a tertiary level effluent, he argued.

The Agent then argued that the MOE classification of a Whitewater unit allowed the elimination of the free access filter sand, if the percolation time of the native soil is less than 50 minutes. The 150 mm sand fill (subsequently proposed to be 250 mm) proposed to be located under the shallow buried trench system will have a percolation time of less than 50 minutes and it was argued that the sand filter was no longer required.

The Agent concluded that instead of cutting a shallow buried trench system into the native subsoil, he is proposing to bury it in shallow sand fill and he offers this as a compensating measure for the free access sand filter.

6. Respondent's Position

The Respondent submitted that the OBC's recognition of "Whitewater" treatment systems and its description in the Supplementary Guidelines only concerns the treatment component of the sewage

system and that the sewage system itself must comply with the related provisions of the Ontario Building Code.

The Respondent argued that the requirement for a free access sand filter in treatment systems such as Whitewater systems is to "provide a sufficient level of treatment to ensure proper disposal in heavier soils". There is no evidence to show that the proposed sand under the chamber is equivalent to the required free access sand filter and that it can provide the same level of treatment equivalent to the approved design. Thus, it is the County's position that the proposed sand fill as a compensating measure for the free access sand filter cannot be deemed acceptable.

The Respondent continued that the "construction of the absorption trenches including the shallow buried trench system does not refer to a reduction of the construction requirement itself". So it is the County's opinion that the chamber system should comply with the OBC requirements for shallow buried trench systems. The Respondent indicated that they had not initially been concerned about the absence of the mantle, however, during the hearing the issue of the mantle became more important.

In summation, the Respondent stated that the installation of Whitewater treatment unit is acceptable if it is installed in conjunction with the required free access sand filter, as described in the Supplementary Guidelines to the 1997 OBC.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed Whitewater treatment system discharging to a shallow buried trench on a 150 mm sand fill layer, without the provision of a free access sand filter and without a full mantle fails to provide sufficiency of compliance with Clause 8.7.4.2.(1)(b). The 15 metre mantle must be supplied and the sand fill must be at least 250 mm thick.

The Commission agrees that the Whitewater system likely meets the requirements of Sentence 8.6.2.2.(2) because it has been included within the Supplementary Guidelines and a free access sand filter may not be required by Sentence 8.6.2.2.(2). However, no information was provided relative to Clause 8.9.2.2 (1)(b) that the manufacturer does not require the free access sand filter where the percolation time of the native soil is between 50 and 125 minutes per centimetre

8. Reason/s

a. A 250 mm sand mantle is required by Clause 8.7.4.2 (1)(b) of the OBC. The low loading rate does not negate the need for a mantle as the loading rate not only could be exceeded during peak uses, but it also may be augmented by precipitation, both resulting in effluent moving laterally.
b. The Commission is not satisfied that a 150 or 250 mm thick layer sand fill is sufficient to "mask" the percolation time of the native soil, and as such it can not compensate for the high percolation rate of the native soil and elimination of the free access sand filter.
c. Based on the fact that the "Whitewater" system is a listed treatment unit under the OBC (SG-5), it can be assumed that the equipment meets the requirements of Table 8.6.2.2.A. If the equipment meets these requirements, under Sentence 8.6.2.2.(2), there is no requirement for a free access sand filter.
d. The equipment must be installed and operated in accordance with the requirements of the manufacturer (Clause 8.9.2.2.(1)(b)). Since the understanding in the past has been for the requirement for the free access sand filter, the manufacturer has placed this requirement in their design. Therefore, the free access sand filter is required, unless the manufacturer is prepared to make submissions under 8.6.2.2.(2).

RULING

1. The Applicant

Mr. Rick Patterson, owner, 5072 Petrolia Line, Ontario, has received an order to comply under the Building Code Act, 1992 to remedy the deficiency of the septic system installed at R.R. # 1 Petrolia, 5072 Petrolia Line, Petrolia, Ontario.

2. Description of Construction

The Applicant has constructed a sewage system with a Class 4 disposal bed to serve a newly built Group C - residential occupancy. The building is described as a single detached dwelling unit containing three bedrooms and 18 fixture units with a finished area of 192 m2. The calculated daily design sewage flow is 1600 litres and the building is served by municipal water supply.

In 1997, the Applicant was issued a certificate of approval under the Environmental Protection Act to install a fully raised leaching bed system. To avoid the installation of a raised bed disposal system, the Applicant used a holding tank until he was required to install an approved system in 1998. This coincided with the transfer of septic regulations to the Ontario Building Code which allowed installation of shallow buried trench systems in soils with a percolation time of less than 125 min/cm. The Applicant then installed an in-ground sewage system designed by himself.

The as-built septic system is described as containing two 4500 L concrete septic tanks and a disposal bed covering an area of 160 m2. The septic tanks have been installed in series and each of them is equipped with an effluent filter attached to their outlets. The effluent from the second tank is discharged to the disposal bed for final disposal. The disposal bed consists of six 21-metre runs. Each of the runs measures approximately 105 mm in width and 900 mm in depth. The runs have been filled with a layer of dunganon drainage stone (87 mm in size) to a depth of 462 mm to 513 mm, and are capped with non-corrosive PVC perforated pipes. These pipes have been covered with a layer of dunganon drainage stone and geo-textile blanket prior to backfilling with 77 to 154 mm of topsoil.

The subject site is a 40-hectare "county lot" with minimal slope and is covered with grass. The soil profile of the site is clay and loam with a percolation time of greater than 50 minutes. No soil evaluation has been carried out to determine the depth to the bedrock or the level of the high groundwater table.

The construction in dispute involves the design and the level of the treatment offered by the proposed system.

2. Dispute

The issue at dispute between the Applicant and the Respondent is whether the as-built sewage system complies with the requirements of the Ontario Building Code for treatment units under Article 8.6.2.2.

Article 8.6.2.2. sets out the thresholds for concentrations of BOD5 (the five day biochemical oxygen demand), CBOD5 (the five day carbonaceous biochemical oxygen demand), and TSS (total suspended solids) in secondary and tertiary level effluent and governs the design criteria to be met in the installation of secondary and tertiary treatment units.

Sentence 8.6.2.2.(1) requires every treatment unit, excluding septic tanks, to be designed in such a way that it provides a secondary level effluent with maximum concentrations given in column two of Table 8.6.2.2.A. However, if the treatment unit is connected to a shallow buried trench disposal system, the effluent must not exceed concentrations stipulated in column three of the same table, i.e. it must have a tertiary level quality (Sentence 8.6.2.2.(2)). In the as-built system, the septic tanks are offered as treatment units that ultimately will provide a secondary level effluent.

Table 8.6.2.2.A.
Other Treatment Unit Effluent Quality Criteria
Forming Part of Sentence 8.6.2.2.(1), (2) and (5)

Parameter	Secondary Effluent1	Secondary Effluent1
BOD5	40	15
CBOD5	30	10
Suspended Solids	30	10
Column 1	2	3

Note to Table 8.6.2.2.A.:

1. Maximum concentration based on 30 day averages in milligrams per litre (mg/L)

Sentences 8.6.2..2.(3) and 8.6.2.2.(4) require all treatment units, excluding septic tanks, to be equipped with an audible and visual warning alarm and that they permit the sampling of the effluent, respectively. The as-built septic tanks are equipped with sampling points, which are accessible from grade, but they are not equipped with warning alarms (although there are no pumps to monitor).

Sentences 8.6.2.2.(5) and 8.6.2.2.(6) concern treatment units described in the Supplementary Guidelines to the 1997 OBC. The as-built septic system does not include any of the treatment units listed in the Supplementary Guidelines to the OBC.

Therefore, at issue is whether the design and performance level of the as-built septic system sufficiently meet the OBC's requirements discussed above.

3. Provisions of the Ontario Building Code

Article 8.6.2.2 Other Treatment Units

(1) A treatment unit other than those described in Article 8.6.2.1. and Sentence (2) shall be designed such that effluent does not exceed the maximum concentrations stipulated in Column 2 of Table 8.6.2.2.A.

(2) A treatment unit that is used in conjunction with a leaching bed constructed as shallow buried trenches shall be designed such that the effluent does not exceed the maximum concentrations stipulated in Column 3 of Table 8.6.2.2.A.

(3) All treatment units referred to in Sentences (1) and (2) that contain mechanical components shall be equipped with an audible and visual warning alarm so located to warn the occupants of the building served or the operator of the treatment unit of a malfunction in the operation of the treatment unit.

(4) All treatment units referred to in Sentences (1) and (2) shall permit the sampling of the effluent.

(5) A treatment unit described in the Supplementary Guidelines to the 1997 Ontario Building Code is deemed to comply with the requirements of Table 8.6.2.2.A. as set out in the Guideline.

(6) Every manufacturer or distributor of a treatment unit shall provide, for each model sold, printed literature that describes the unit in detail and provides complete instructions regarding the operation, servicing, and maintenance requirements of the unit and its related components necessary to ensure the continued proper operation in accordance with the original design and specifications.

5. Applicant's Position

The Applicant submitted that the tests done on the effluent at the very early stages of the system's operation show a high level of reduction in concentrations of TSS and BOD5.

In support of his argument, the Applicant submitted the results of the tests done by an independent lab as well as the lab facilities where he works. The sample analysed by the independent lab one month after the system's installation shows the concentration of the BOD5 as 13.2 mg/L and the concentration of TSS as 57.3 mg/L. However, two months later, the same lab determined the level of TSS as 8.8 mg/L. On the other hand, the tests done in the Applicant's work place lab at different stages of the system's operation show a reduction in concentration of TSS from 345.14 mg/L in the primary effluent to an average of 19.60 mg/L in the secondary effluent. The Applicant explained that the reason for this gradual decrease is due to the system working on the principal of increased settling time within the two treatment units where anaerobic digestion and solid settling occurs. The high level of TSS at the beginning is, therefore, due to inadequate settling time. However, as the test results show, the performance level of the system has increased over time and so too has the quality of the effluent improved. This may also result from the maturing of the biomat on the effluent filters.

In respect of the installation of a smaller bed, the Applicant argued that his property could not accommodate longer distribution pipes and that the composition of the bed, the high quality of the effluent applied to it, and the low level of water consumption compensate for this deficiency.

The Applicant concluded that in his opinion the as-built system is equivalent to a Class 4 septic system with different bed composition, but the same level of performance as required by the OBC. The successful operation of the system over the past two years without any effluent breaking out or odour problems of any sort despite all variations of climate conditions, proves the system's effectiveness and its sufficiency of compliance with requirements of the OBC.

6. Respondent's Position

The Respondent submitted that the test results provided by the Applicant are not extensive enough to prove the level of treatment provided by the septic tanks. In addition, the installed leaching bed does not comply with the requirements of the OBC provided in Part 8.

At the outset, the Respondent noted the timing for approvals in relation to the transfer of the septic regulations to the OBC. The Respondent stated that the Applicant installed the subject septic system without a permit because of his dislike for the then-required raised bed system on clay soils under the Environmental Protection Act (EPA). The Applicant had discussed the matter of an experimental sewage system with the Ministry of the Environment (MOE). However, he has never formally applied to MOE for a permit for such an experimental sewage system. Instead, the Applicant has only been issued a temporary use permit to install the septic tanks as holding tanks until he applies for a shallow buried trench sewage system approval (formerly considered by the MOE as an experimental system), which was to be allowed in the County of Lambton under the EPA. However, the regulations concerning the construction of private sewage systems were transferred from the EPA to Building Code Act, where shallow buried trench systems were classified as Class 4 systems, providing tertiary effluent level treatment for domestic sewage.

The Respondent argued that as the Applicant's certificate of approval under the EPA had expired, the design of the septic system must comply with the requirements of the OBC. However, despite the referencing of seven different tertiary treatment units in the Supplementary Guidelines to the OBC, the Applicant has never approached the County (the Respondent) to amend his certificate under the EPA, nor has he designed a system that sufficiently meets the requirements of the OBC and provides the performance level mandated by the OBC.

The Respondent argued that the analysis of the effluent collected by the Applicant and tested by an independent lab is not extensive enough in duration to show actual levels of treatment offered by the septic tanks. Furthermore, it does not include information about the level of CBOD5.

The Respondent also argued that the system cannot be considered as a shallow buried trench system as it is not a pressurized system and has been installed too deep in the ground. As well, under the OBC, the level of treatment associated with a shallow buried trench system is tertiary while the level of treatment offered by the subject septic tanks is secondary at best.

For theses reasons, the Respondent concluded that he believes neither the design of the system nor its performance level sufficiently meets the requirements of the OBC and should not, therefore, be considered as an equivalent to a shallow buried trench system for the purpose of Clause 2.7.1.1.(1)(b).

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed septic system consisting of two 4500 litre septic tanks, two effluent filters and an existing trenched leaching bed with six 21-metre long trenches does not provide sufficiency of compliance with Article 8.6.2.2. of the Ontario Building Code.

8. Reasons

1) There was not adequate evidence provided to demonstrate that the effluent quality meets the thresholds set out in Table 8.6.2.2.A over a sufficient period of time.

2) Sentence 8.7.2.1.(1) of the OBC does not permit the construction of a trenched in-ground leaching bed in soils having a percolation time greater than 50 minutes per centimetre.

The Respondent

RULING

1. The Applicant

Mr. Jason Abbott, Manager, Air Athletics Inc., Ontario, has applied for a building permit under the Building Code Act, 1992 to construct a tennis facility at the Air Athletics sports complex, 1333 North Service Road, Oakville, Ontario.

2. Description of Construction

The Applicant is proposing to construct a new sports facility classified as having a Group A, Division 2 assembly occupancy. The structure is described as one storey in building height, 3,344 m^2 in building area and having dimensions of 91.44 by 36.57 m. The building is to be equipped with a sprinkler system, but not a fire alarm system. The structure is intended for use as a tennis facility and is proposed to hold a maximum of six courts. It will be heated in winter for year round usage.

The construction in dispute involves the basic construction of the building. The Applicant is proposing to erect the subject structure using arched steel frames set in concrete piers. This frame will support the building envelope, which is to be comprised of a translucent combustible fabric membrane.

3. Dispute

There are two issues in dispute between the Applicant and Respondent. The first is whether the proposed fabric material roof, which is not considered as a Class A, B or C roof covering, provides sufficiency of compliance with Sentence 3.1.15.2.(1) of the Ontario Building Code at the Air Athletics sports complex, 1333 North Service Road, Oakville, Ontario. This provision requires that all roofs must have a Class A, B or C classification as set out in Article 3.1.15.1., which in turn mandates that a roof covering must be determined in conformance with CAN/ULC-S107-M, "Standard Methods of Fire Tests of Roof Coverings". The roof, as proposed by the Applicant, is to consist of a combustible fabric membrane and does not have a Class A, B or C classification in accordance with the CAN/ULC-S107-M standard.

Sentence 3.1.15.2.(2) provides an exception to Sentence (1). It permits the Class A, B or C roof covering requirement to be waived for tents, air-supported structures and buildings with an A2 occupancy that are less than two storeys and 1,000 m^2 if a noncombustible material is installed under the roof cover. Since the subject building is intended to be a permanent structure and because it is not supported by air pressure but instead by a steel frame, the proposed tennis facility cannot be considered as either a tent or an air-supported structure. Moreover, with a proposed building area of 3,344 m^2, it is too large to be considered under the final exemption in Sentence 3.1.15.2.(2). As a result, the relaxation offered in this provision regarding the roof classification is not applicable to the building in dispute.

The second issue is whether the building, as a structure covered in a fabric material, is required to comply with Article 2.1.1.11. of the OBC at the above referenced structure. OBC 2.1.1.11. stipulates that the energy efficiency of all buildings shall be designed to good engineering practice in a manner consistent with that described in ASHRAE/IES 90.1-1989, "Energy Efficiency Design of New Buildings Except Lowrise Residential Buildings" and the 1997 OBC Supplementary Guidelines or the Model National Energy Code (MNEC) for Buildings, 1997. Essentially, Article 2.1.1.11. requires that buildings be energy efficient and the referenced standards provide "good engineering practice" to achieve this.

ASHRAE 90.1 and MNEC deal with energy efficiency requirements in numerous building systems, such as auxiliary systems and equipment, building envelope, electrical power, energy management, HVAC systems, lighting and service water heating systems and equipment. Similar to a tent or an air supported structure, the subject building, proposed to be enclosed by a fabric membrane, would have difficulty meeting the energy efficiency standards for some of these building systems, especially those relating to building envelope. ASHRAE 90.1 and MNEC both offer an exemption to tents and air-supported structures with respect to meeting the building envelope requirements. Again, however, the proposed building is considered neither a tent nor an air-supported structure.

At issue, therefore, is whether the structure, due to its proposed enclosure with a fabric membrane, is required as per Article 2.1.1.11. to conform to all energy efficiency requirements set out in ASHRAE 90.1 or the MNEC.

4. Provisions of the Ontario Building Code

Article 3.1.15.2. Roof Coverings

1. Except as permitted by Sentence (2), every roof covering shall have a Class A, B or C classification as determined in accordance with Article 3.1.15.1.
2. A roof covering is not required to have a Class A, B or C classification for
    a. a tent,
    b. an air-supported structure, or
    c. a building of Group A, Division 2 occupancy not more than 2 storeys in building height and not more than 1,000 m 2 (10,800 ft 2) in building area provided the roof covering is underlaid with noncombustible material.

Article 2.1.1.11. Energy Efficiency

1. Except for buildings of residential occupancy within the scope of Part 9, farm buildings and areas of buildings intended primarily for manufacturing or commercial or industrial processing, the energy efficiency of all buildings shall be designed to good engineering practice such as described in
    a. the ASHRAE/IES 90.1.1989, "Energy Efficient Design of New Buildings Except Lowrise Residential Buildings" and the Supplementary Guidelines to the 1997 OBC, or
    b. the Model National Energy Code for Buildings, 1997.

5. Applicant's Position

At the outset, the Agent argued that the proposed building, as a tension membrane structure, should be viewed as a tent or as an air supported structure, even though it does not strictly adhere to either definition. He then added, however, if the Commission rejects this view, the following discussion will demonstrate the safety of the building as a permanent structure.

On the issue of the roof classification, the Agent acknowledged that the fabric membrane does not meet CAN/ULC-S107-M, "Standard Methods of Fire Tests of Roof Coverings" and as a result cannot be classified as a Class A, B or C roof covering. Nevertheless, as he stated, the fabric has been tested to

both NFPA 701, "Standard Method of Fire Tests for Flame-Resistant Textiles and Films" and CAN/ULC S109, "Standard for Flame Tests of Flame Resistant Fabrics and Films" which are the standards that recognized by the OBC and the Ontario Fire Code for awnings and tents. The tests indicated that flame does not propagate when exposed to the membrane. Consequently, the material, while still considered combustible, performs as well as can be expected in a fire situation. Moreover, the Agent argued that the building has been made considerably safer since it is to be fully sprinklered. As well, he noted that the sprinkler system, albeit installed on the high roof of the structure, would actuate prior to fire causing damage to the fabric since the sprinkler activation temperature is much lower than the melt point of the roof.

The Agent also indicated that the building was safe from a fire safety standpoint because, at approximately 48 to 50 people, it will have a low occupant load. As he reasoned, on six courts of tennis a maximum of 24 people could play at any one time, plus a total of 24 potential observers were anticipated. No viewing facilities for spectators are proposed and the building is to be used for tennis only. No other sports, parties, gatherings or raves are to be allowed, the Agent noted. In addition, the building will contain very little in terms of fuel load to propagate fire and the spatial separation between the proposed structure and the existing buildings and property lines are nearly triple the required distance. As well, fire extinguishers are to be provided.

Regarding the second issue, energy efficiency, the Agent argued that the proposed building should be exempt from the requirements found in ASHRAE 90.1 or MNEC. As he argued, apart from the fact that the tennis facility is structurally supported by steel arches and not air pressure, there is very little to distinguish this building from an air-supported structure. Consequently, he saw no reason why the subject structure should also not enjoy an exemption from at least some of the energy efficiency requirements, especially those relating to building envelope. In his view, it is not practical nor feasible for the proposed building to comply with Article 2.1.1.11. This impracticality, he continued, is recognized by Sentence 1.1.2.1.(5) of the MNEC which references Appendix commentary E-1.1.2.1.(5). The Appendix provision, he noted, specifically mentions "sports facilities" as being one of the buildings that may have difficulty meeting the requirements of the MNEC and still function as intended. The Appendix commentary adds that in such cases the authority having jurisdiction may wish to permit an exception.

In terms of the actual energy that will be consumed by the tennis building, the Agent argued it will be minimal. He indicated that the only energy usage would be heat in the winter and lighting at night. The translucent fabric, he noted, will make daytime operation possible without lighting, which itself is a considerable energy savings. And since the building is to be supported by a steel frame it would not

need constant air pressure supplied continuously by fans to remain standing. Thus representing an improvement over air-supported buildings.

Lastly, the Agent concluded that based on the above reasons, sufficiency of compliance for the lack of a classified roof had been provided. Further, the structure, as a building enclosed with a fabric membrane, need not comply with the energy efficiency requirements found in Article 2.1.1.11.

6. Respondent's Position

The Respondent submitted that the proposed building is not a tent nor is it a air-supported structure. The building, he argued, is accurately described as a tension membrane structure. Moreover, the Code does not permit such buildings. As a result, the proposed tennis facility should be treated as a permanent building and must comply with all applicable provisions of the OBC, including Sentence 3.1.15.2.(1) and Article 2.1.1.11. regarding roof classification and energy efficiency respectively.

The Respondent indicated that he has some specific concerns about the project. Specifically, he was troubled by the fact that the sprinkler heads, being approximately 16 to 17 m high, would likely not activate until a roaring fire had developed at the tennis surface. He also felt that the intended location of the building, near houses situated on an escarpment, could be a problem despite that the spatial separation was more than required. In addition, if the sports facility were to change ownership, the future owners may wish to use the tennis facility for uses that may have a higher occupant load. He noted that the site had changed hands frequently.

In summation, the Respondent argued that the proposed building did not fit the existing categories of buildings found in the current OBC. And as an anomalous structure, erring on the side of caution insofar as building standards are concerned is prudent. In addition, he insisted that if the BCC were to approve the proposal at hand they should attach some serious limitations controlling its usage and operation. For example, he hoped the Commission would restrict the use of the building to tennis only and limit the occupant load to the minimum number of actual users. He also expressed a desire to see the combustible load of the building remain low, in particular prohibiting the construction of any other structures within the facility.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed fabric material roof, which is not considered as a Class A, B or C roof covering provides sufficiency of compliance with Sentence

3.1.15.2.(1) of the Ontario Building Code (OBC) at the tennis facility within the Air Athletics sports complex, 1333 North Service Road, Oakville, Ontario on condition that:

1. The use of the building is restricted to not more than 6 courts of tennis and is limited to tennis use only;
2. The occupant load is restricted to a maximum of 48 persons;
3. No additional structures are permitted to be constructed inside the subject building;
4. No storage of any material except as is consistent with that of an indoor tennis court is permitted; and,
5. A spatial separation from adjacent buildings and property lines of at least 30 m must be provided.

   It is also the decision of the Building Code Commission that the structure covered in a fabric material is not required to comply with Article 2.1.1.11. of the OBC at the above referenced facility on condition that:

6. The electrical lighting and HVAC systems provided in the building exceed the prescriptive requirements for such systems in ASHRAE 90.1 or the Model National Energy Code for Buildings; and,
7. A portion of the heating system make use of solar heating, heat pumps or heat exchanges.

8. Reasons

a. The occupant load of the structure will be low considering its building area.
b. The fuel load will be low.
c. The proposed structure will have considerable separation from any other building.
d. The HVAC and lighting systems will provide improved energy efficiency than would be normally required.

Dated at Toronto this **29th,** day in the month of **June** in the year **2000** for application number **2000-34**.

BCC Ruling No. 00-30-762

BUILDING CODE COMMISSION DECISION ON B.C.C. #00-30-762

IN THE MATTER OF Subsection 24(1) of the *Building Code Act, 1992*.

AND IN THE MATTER OF Sentence 9.10.14.12.(5) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Lou Squazzin, Construction Manager, Kenmore Homes (1987) Inc., London, Ontario, for the resolution of a dispute with Mr. R. Cerminara, Chief Building Official, City of London, Ontario, to determine whether the existing exposing building face that does not offer a fire-resistance rating of 45 minutes and is clad with combustible siding, but which has been built with a zero metre limiting distance, provides sufficiency of compliance with Sentence 9.10.14.12.(5) of the Ontario Building Code for at Lot 191, 331 Whitesands Drive, London, Ontario.

RULING

1. **The Applicant**

   Mr. Lou Squazzin, Construction Manager, Kenmore Homes (1987) Inc. London, Ontario, has received an order to comply under the *Building Code Act, 1992,* to remedy certain perceived deficiencies at Lot 191, 331 Whitesands Drive, London, Ontario.

2. **Description of Constrution**

   The Applicant has recently constructed a new, detached Group C - residential building. The dwelling is described a 1 ? storey backsplit house with a building area of 111 m^2 and is of combustible construction.

   The north facing wall of the house has a limiting distance of zero metres to the lot line. The one storey western portion of this wall, located to the front of the dwelling, is clad with a veneer of brick. The 1 ? storey rear, or eastern portion, of the wall is clad with brick veneer on the lower third while the upper two thirds is vinyl siding. The construction of the wall assembly where the siding is located is (from interior to exterior); 12.7 mm drywall, 6 mm poly, fibreglass batt insulation, 2" by 4" wood studs, Cladmate sheathing, building paper, and vinyl siding. The fire-resistance rating of this exposing building face is not considered to be at least 45 minutes.

The distance between the rear of the subject house, where the siding is located, and the adjacent house is 4.15 m. A 1.8 m wide municipal easement located directly beside the disputed building runs the entire length of the lot line on the neighbouring property. This easement, created by by-law, provides for municipal access onto this property for servicing purposes.

The construction in dispute involves the as-constructed combustible exposing building face built with a limiting distance of zero to the lot line.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the existing exposing building face that does not offer a fire-resistance rating of 45 minutes and is clad with combustible siding, but which has been built with a zero metre limiting distance, provides sufficiency of compliance with Sentence 9.10.14.12.(5) of the Ontario Building Code. This provision permits the effective limiting distance to be projected to a point beyond a property line under certain conditions, namely that the owners of the affected properties and the municipality enter into an agreement to do so and that this agreement be registered on title.

The Applicant proposes that the 1.8 m wide easement, which has been created by a municipal by-law and is registered on title of both properties, be substituted for the legal agreement specified in Sentence 9.10.14.12.(5). The appropriate limiting distance necessary to ensure conformance for the approximately 18 m^2 vinyl siding portion of the wall is 1.2 m as per Sentence 9.10.14.12.(2).

While the substitution of a municipal easement in lieu of an agreement conforming to Sentence 9.10.14.12.(5) is a significant question, it is, in the Commission's view, predominantly a legal, not a technical, consideration. Since the mandate of the BCC is to deal with the technical requirements of the OBC, the Commission will therefore focus on the technical issue of whether sufficient protection with respect to the subject exposing building face has been provided.

At issue thus, is whether adequate compensatory measures are being offered in lieu of providing a legal agreement as required in Sentence 9.10.14.12.(5).

4. **Provision of the Building Code**

Sentence 9.10.14.12.(5) - Exposing Building Face of Houses

(5) The required limiting distance for an exposing building face is permitted to be measured to a point

beyond the property line that is not the centre line of a street, lane or public thoroughfare if;

a. the owners of the properties on which the limiting distance is measured and the municipality enter into an agreement in which such owners agree that,

i. each owner covenants that, for the benefit of land owned by the other covenantors, the owner will not construct a building on his or her property unless the limiting distance for exposing building faces in respect of the proposed construction is measured in accordance with the agreement,

ii. the covenants contained in the agreement are intended to run with the lands, and the agreement shall be binding on the parties and their respective heirs, executors, administrators, successors and assigns,

iii. the agreement shall not be amended or deleted from title without the consent of the municipality, and

iv. they will comply with such other conditions as the municipality considers necessary, including indemnification of the municipality by the other parties; and

b. the agreement referred to in Clause (a) is registered against the title of the properties to which it applies.

5. **Applicant's Position**

The Applicant acknowledged that they do not have a written legal agreement as stipulated in Sentence 9.10.14.12.(5) of the Ontario Building Code. He argued, however, that since no construction will occur in the easement on the neighbour's property directly beside the subject house, the agreement is unnecessary. The easement, in fact, accomplishes everything that would an agreement referred to in Sentence 9.10.14.12.(5). To this end he offered the following statement:

"We feel sufficiency of compliance with the technical requirements of Section 9.10.14.12.(5) of the building code have been met for this home. The limiting distance for the North wall of this

home we believe can be measured to a minimum distance of 1.2 meters (sic) into the 1.8 meter (sic) easement along the North side of this property on the adjacent property which is registered to both property owners. Construction on this easement is protected from construction as outlined in the City of London By-law Z-1, Section 5(3). This By-law is only able to be removed by the City of London if they decide to amend the By-law. Thus, we feel that a sufficient agreement is in place to prevent the construction on this easement without written consent from the City. We feel all requirements have been met to show sufficiency of compliance of Section 9.10.14.12.(5)."

In support of this argument, the Applicant submitted two other documents. The first was a letter expressing an opinion by his legal counsel that reiterated the position that the situation with respect to building encroachments between the two properties is governed by the By-Law. The letter, he noted, states that the easement is sufficient to allow the City to prevent construction. The second item was a copy of the By-Law which demonstrated the requirement to register these easements on title. Attached to that was a copy of the actual deed of land for the subject property showing the easement it enjoys on the neighbouring land as well as an easement the adjacent owner on the other side of the property has on the opposite side of the disputed lot.

6. **Respondent's Position**

The Respondent submitted that, in their view, there are two ways the subject zero lot line exposing building face can comply with the Ontario Building Code. The first is by conforming to the construction requirements in Sentences 9.10.14.12.(2) and (3), which in the present case would mean that the wall assembly would have to provide a minimum fire-resistance rating of 45 minutes. This could be achieved, he noted, by removing the siding and building paper and adding a layer of 12.7 mm (? in) drywall on the outside of the studs. The second way is to enter into an agreement as stipulated in Sentence 9.10.14.12.(5). Since neither of these alternatives have been met, the Respondent indicated that the exposing wall was in violation of the Code.

On the question of whether an easement can be substituted in lieu of a legal agreement between the property owners and the municipality (which he described as a "no build agreement"), the Respondent stated that the Code specifically asks for an agreement. He argued that a literal reading of the Code clearly does not allow easements to be used in place of a Sentence 9.10.14.12.(5) agreement.

Nevertheless, the Respondent recognized that the easement prevents the neighbouring owners from building in that area, and as a result he expressed a degree of support for the Applicant's

position. Indeed, he indicated that the Applicant has raised an important question as to whether an easement as such can in fact replace the legal agreement set out in Sentence 9.10.14.12.(5). He added that it was his hope that the Commission could provide some direction on this issue.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the existing exposing building face that does not offer a fire-resistance rating of 45 minutes and is clad with combustible siding, but which has been built with a zero metre limiting distance, does not provide sufficiency of compliance with Sentence 9.10.14.12.(5) of the Ontario Building Code for at Lot 191, 331 Whitesands Drive, London, Ontario.

8. **Reasons**

i. Since a legal agreement between the relevant parties and the municipality has not been prepared the proposal does not meet OBC 9.10.14.12.(5).

ii. No compensating measures were proposed.

9. **Recommendation(s)**

The BCC recommends that this issue be examined by the Branch to determine if an agreement between adjacent property owners, as referenced by Sentence 9.10.14.12.(5), is necessary where there is an easement in place created by municipal by-law.

Dated at **Toronto** this **29th** day in the month of **June**, in the year **2000**, for application number **2000-31**.

BCC Ruling No. 00-29-761

BUILDING CODE COMMISSION DECISION ON B.C.C. No. 00-29-761

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Sentences 3.4.3.5.(3), 3.4.3.5.(4), and 3.3.1.17.(3) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Hugh Magennis, Vice-President, Invar (Post Road) Corporation, North York, Ontario, for the resolution of a dispute with Mr. Yaman Uzumeri, Chief Building Official, City of Toronto, Ontario, to determine whether the as-built handrail that projects 100 mm into the required 750 mm minimum width of a landing where a door swings into an exit stair complies with Sentence 3.4.3.5.(3) of the Ontario Building Code (OBC), and whether the guards containing outward curving metal balusters comply with OBC Sentence 3.3.1.17.(5) at One Post Road, Toronto, Ontario.

RULING

1. The Applicant

Mr. Hugh Magennis, Vice-President, Invar (Post Road) Corporation, North York, Ontario, has received a building permit under the Building Code Act, 1992 and is constructing a new four storey residential building known as One Post Road, Toronto, Ontario.

2. Description of Construction

The Applicant is constructing a new Group C - residential building. The building is four storeys in height and 3,065 m2 in building area. It is of noncombustible construction and equipped with a sprinkler system, fire alarm system, and a standpipe and hose system.

There are two elements in dispute in the construction of this building. The first involves the projection of a handrail into the required width of a landing where a door swings into an exit stair. In this regard, the handrail in question projects 100 mm into the 750 mm clearance from the arc of the door swing and the opposing wall in the exit stair landing. As a result of the handrail projection, the clear width of the landing is reduced to 650 mm.

The second area of construction in dispute involves the design of the balusters used in the guards of the exterior terraces. The subject balusters, when the balcony is viewed in section, are not vertical. They are designed with an outward projecting curvature, i.e., in a bow shape. At issue in particular is the lower portion of the balusters which curve away from the exposing face of the building. The slope of this portion is measured at 55° from horizontal at approximately 300 to 350 mm above the terrace surface.

3. Dispute

There are two issues at dispute between the Applicant and Respondent. The first being whether the as-built handrail, that projects 100 mm into the 750 mm required minimum width of a landing where a door swings into an exit stair, complies with Sentence 3.4.3.5.(3) of the Code and the second involves whether the guards, containing outward curving metal balusters, comply with OBC Sentence 3.3.1.17.(5).

In reference to the first issue, according to Sentence 3.4.3.5.(3), swinging doors cannot reduce the required width of exit stairs or landings to less than 750 mm. However, Sentence 3.4.3.5.(4) provides that, if a landing or an exit stair accommodates a handrail, the handrail and any construction below it, can project up to 100 mm into the required width. The handrail in dispute projects 100 mm into the required width of the exit stair landing, thereby providing a clear width of 650 mm. At issue between the parties is whether compliance with Sentence 3.4.3.5.(3) can be achieved when considering Sentence 3.4.3.5.(4). In this case the question being posed is, can the required width of exit stairs or landings, already reduced to 750 mm by a swinging door, be further reduced to 650 mm by way of a 100 mm handrail projection?

In respect to the second issue, Sentence 3.3.1.17.(5) stipulates that, unless it can be shown that openings in a guard do not pose a hazard, the guard must be designed so that it does not facilitate climbing. The subject guards contain balusters that curve outward for a short distance. The curved portion of balusters has a maximum slope of 55° from horizontal and 35° from vertical. The dispute between the parties in this regard involves whether the outward slope created by this curvature is horizontal enough that it may represent a foothold and thereby facilitate or promote climbing of the guard.

4. Provisions of the Ontario Building Code

Sentences 3.4.3.5. Exit Width Reduction

3. Swinging doors in their swing shall not reduce the required width of exit stairs or landings to less than 750 mm (2 ft 6 in) or reduce the width of an exit passageway to less than the minimum required width.
4. Handrails and construction below handrails are permitted to project into the required width of means of egress but the projections shall be not more than 100 mm (4 in) on each side of the required width.

Sentence 3.3.1.17. Guards

5. Unless it can be shown that the location and size of openings do not present a hazard, a guard shall be designed so that no member, attachment or opening located between 140 mm (5 ? in) and 900 mm (2 ft 11 in) above the level protected by the guard will facilitate climbing.

5. Applicant's Position

The Agent for the Applicant submitted his position on the two issues in dispute, namely that, a) the Code permits a handrail to project up to 100 mm into the required 750 mm minimum width of a landing, including where a door swings into an exit stair, and b) the design of the curved metal balusters or pickets cannot reasonably be held to "facilitate climbing".

With respect to the first dispute, the Agent argued that Sentences 3.4.3.5.(3) and 3.4.3.5.(4) are linked and should be read in conjunction with one another. The required width of 750 mm where a door swings into an exit stair or landing has been provided in this instance. The literal wording of the Code allows handrails and construction below handrails to project 100 mm into this minimum required width. In the Agent's opinion, "the minimum 750 mm clear width of means of egress required where a door swings into a stair landing relates to the clear width at shoulder and upper arm height. The projection of a handrail 100 mm into this 750 mm clear width will not impede the effectiveness of the required minimum width."

The Applicant's Agent also noted that "both Sentences 3.4.3.5.(3) and (4) use the words ‘required width' when referring to the required clearance between the arc of the door swing and an opposing side of the exit as well as to the width of the means of egress into which the handrail is allowed to project. Very literally, the minimum required width of the exit stair at a landing where a door swings into the exit stair is 750 mm beyond the arc of the door. If this is the ‘required width' of the exit at the arc of the door swing, then the ‘required width' into which a handrail may project up to 100 mm is 750 mm. On this basis, the clearance from this handrail to the arc of the door swing may be not less than (750-100) = 650 mm in accordance with the literal Code."

With regard to the second dispute, the Agent argued that the primary concern related to the outward curving of balusters is whether the sloped portion facilitates climbing. The common definition of "facilitate" is "to make it easy". In this respect, he suggested that regard must be had as to whether the slope of the subject pickets makes it easy to climb the guard. He went on to state that, because the Code provides no direction as to when a baluster's angel becomes climbable, he has obtained an expert opinion in this regard. According to an evaluation of the Applicant's plans by Jake Pauls of Jake Pauls Consulting Services in Building Use and Safety, the pickets would not facilitate climbing, given the proposed design. Mr. Pauls, in his letter of September 3, 1999, states with "(a) small portion of the curvature is at approximately 35 degrees, maximum, from vertical...(e)ven if one were to place ones feet on this portion of the pickets, one would have to tilt away from the exterior side of the guard to gain any possible footing due to friction against the pickets. Such a body posture is in the safe direction."

The Agent for the Applicant concluded his submission on both issues by advising the Commission that, when reasonably considered, both areas of construction in dispute comply with the literal interpretation of the Code.

6. Respondent's Position

The Respondent submitted that, in relation to the first issue, the Code requires that landings be 1,100 mm wide. A reduction in the required width is permitted to not less than 750 mm to allow for the swing of a door opening into the landing. This width cannot, in his opinion, be further reduced by the 100 mm projection of handrails. The two requirements are mutually exclusive and the effect cannot be cumulative. The Code did not intend, in this instance, to allow the required width of a landing that accommodates a door swing to be reduced to 650 mm.

With respect to the second dispute, the Respondent also argued that the term "facilitate" in the Code means "to make easier". In his view, however, the baluster design in the guard does not comply with the literal meaning of the Code since the outward curvature can be considered to make it easier to climb. The Respondent questioned whether this design was safe. The requirements of the OBC, he argued, are intended to protect children and adults with diminished capacity. Children have greater flexibility than adults and could easily climb this guard. They wouldn't need to lean back when standing on the curved portions, as suggested by the Applicant's expert.

The Respondent went on to suggest that normal construction practice provides balusters that are completely vertical. That is the reference point from which the safety of this construction should be considered. Even then, a guard could be considered climbable. In summation, the Respondent noted that

this is a performance based-type Code issue and, in the City's view, the balusters in questions facilitate climbing.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-built handrail that projects 100 mm into the 750 mm required minimum width of a landing where a door swings into an exit stair complies with Sentence 3.4.3.5.(3) of the Ontario Building Code and also that the guards containing outward curving metal balusters comply with Sentence 3.3.1.17.(5) of the Ontario Building Code at One Post Road, Toronto, Ontario.

8. Reasons

i. The reduction in the required width of a landing to facilitate the door swing and handrail is in compliance with Code provisions. The OBC requires a landing width of 750 mm to accommodate the arc of a door swing and also permits a 100 mm projection by handrails or construction below handrails into the required width of a means of egress.

ii. The guards, with balusters having an outward curve creating a slope on the lower portion of the picket to a maximum of 55° from the horizontal, do not facilitate climbing. The curvature is directed outward from the terrace and from the upper rail of the guard, therefore, making it difficult to climb.

Dated at Toronto this 14 th day in the month of June in the year 2000 for application number 2000-27.

RULING

1. The Applicant

Mr. Claudio Rabagliao, Turner Fleischer Inc., Toronto, Ontario, has received a building permit under the Building Code Act, 1992 and is currently constructing a care facility known as the Sunrise Assisted Living facility of Markham located on Swansea Road, Markham, Ontario.

2. Description of Construction

The The Applicant is currently building a new care and treatment facility classified as having a Group B, Division 2 major occupancy. The structure is described as three storeys in building height, 1,891 m2 in building area and is of noncombustible construction. The building is equipped with a fire alarm system, a standpipe and hose system and a sprinkler system. A central kitchen and dining facility will be provided in the building for the residents.

The facility consists of a total of 81 suites, each with a separate bathroom. Each bathroom consists of a water closet, a lavatory and a bathtub. The bathrooms are ventilated to the roof by a central exhaust system which includes a heat recovery ventilator.

The suites are equipped with individual heat/cooling systems which can be controlled. As well, the windows may be opened.

The construction in dispute involves the exhaust ventilation in the suite washrooms. Each suite washroom has two fixtures that require ventilation. The Applicant is proposing that the suite washrooms be equipped with a single fan unit that provides 24 L/s of exhaust on a continuous basis. The exhaust would then be vented to a heat recovery system which preheats the fresh air supply ventilation. The design of the system is intended to provide continuous ventilation consisting of supply and exhaust air in each suite.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed installation of a single fan unit providing 24 L/s exhaust on a continuous basis, which serves a washroom with two fixtures requiring ventilation, provides sufficiency of compliance with Sentence 6.2.3.9.(12) of the Ontario Building Code. This provision requires that the exhaust capacity for each sanitary fixture, excluding wash basins, within a bathroom must be at least 24 L/s (50 cfm). Therefore, for washrooms with two fixtures requiring ventilation as is the case in the subject building, the required level of ventilation is 48 L/s (100 cfm).

As noted, the Applicant is proposing to provide fan units that offer only 24 L/s of exhaust. The system, as proposed however, operates on a continuous basis and not intermittently, i.e., only when in use. The OBC, however, does not contain provisions which

4. Provisions of the Ontario Building Code

Sentence 2.6.2.1. Governing Documents

(1) In the case of a conflict between the provision of this Code and those of a referenced document, the provision of this Code shall govern.

Sentence 6.2.3.9. Exhaust Ducts and Outlets

(12) Except for wash basins (lavatories), the exhaust air provided shall not be less than 24 L/s (50 cfm) for each sanitary fixture listed in Sentence (8).

5. Applicant's Position

At the outset, the Agent for the Applicant stated that the subject building is based on an assisted living concept, but has the appearance of a regular residence. He further noted that the building was designed by a US architectural firm. Likewise, the ventilation system has been designed by a mechanical engineer from the US.

The Agent outlined that the proposed design of the single fan unit provides 24 L/s for the washroom and that the exhaust is continuous. He further added that the exhaust is connected to a heat recovery system which preheats the fresh air supply and that the proposed ventilation system relies on a concept of a continuous ventilation of supply and exhaust air in each suite.

The Agent stated that the exhaust system provided is a superior system to the minimum intermittent system accepted by the Code. He argued that if 48 L/s of intermittent exhaust satisfies Code requirements, then 24 L/s of continuous exhaust should at least be considered equivalent to Code. The Agent acknowledged that the proposed washroom ventilation system does not comply with the prescriptive requirements of Sentence 6.2.3.9.(12). Nevertheless, he maintained that the proposal meets the intent of this provision.

As the Agent argued, an intermittent system that operates probably only one hour per day would exhaust roughly 6,000 ft3 whereas a continuously running ventilation system would output 72,000 ft3, a 12-fold increase in air quality. Moreover, since the suites are private with nearly all having a single occupant the washroom fixtures would therefore tend not to be used simultaneously. As well, the Agent felt that the ventilation requirement for each fixture seemed onerous and questioned the additional exhaust capacity which would merely consume more energy.

The Agent referenced the ASHRAE 62-1989 Standard and the CAN/CSA-F326-M91 Standard, both of which provide for intermittent or continuously operated single fan units. The ASHRAE 62- 1989 Standard is generally accepted across North America and distinguishes between ventilation for public washrooms and residential washrooms. Its requirement for residential washrooms is 24 L/s for intermittent operation, or 10 L/s for continuous operation. He noted that the ASHRAE Standard does not

specify an exhaust quantity per fixture for a residential washroom, as it is presumed that only one fixture is operated at one given time. The level of ventilation required in the CAN/CSA-F326-M91 Residential System Ventilation Code is almost exactly the same, the Agent added.

Lastly, the Agent concluded that the ventilation design proposal is reasonable and represents good engineering practice. In his view, the Respondent was interpreting the Code in an excessively rigid manner. While there are obviously two fixtures requiring ventilation, the Agent felt it important that the Code be interpreted consistent with an understanding of engineering principles. If only one fixture is used at a time, coupled with continuous ventilation, then that should be considered sufficient and thus meet Code requirements.

6. Respondent's Position

The Designate for the Respondent submitted that the OBC is very clear on the issue in dispute and that no interpretation is needed. In the context of the subject building, Sentence 6.2.3.9.(12) requires that each bathroom containing a water closet and shower must have an exhaust capacity of not less than 48 L/s (2 x 24 L/s for each sanitary fixture). In addition, the OBC does not provide an alternate option for the exhaust capacity for a fan which operates on a continuous basis.

Nevertheless, the Designate did concede, however, that he thought the proposal had some merit. He commended the HRV on the washroom exhaust and acknowledged that the ASHRAE 62-1989 Standard for the continuous exhaust allows for a reduction of ventilation to only 24 L/s for each bathroom.

However, the Designate noted that Sentence 2.6.2.1.(1) of the OBC stipulates that where there is a conflict between the provisions of the OBC and the provisions of a document referenced by the Code, the "provision of this Code shall govern". Thus the Designate felt compelled to uphold Ontario Building Code requirements and concluded by indicating that each bathroom must have a minium of 48 L/s (100 cfm) exhaust as required by 6.2.3.9.(12).

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed installation of a single fan unit providing 24 L/s exhaust on a continuous basis to serve a bathroom with two fixtures requiring

ventilation provides sufficiency of compliance with Sentence 6.2.3.9.(12) of the Ontario Building Code at Sunrise Assisted Living facility of Markham, Swansea Road, Markham, Ontario.

8. Reasons

The overall level of safety in the building has been improved through the following factors:

1. The building incorporates a ventilation system that provides for good air quality and includes energy conservation measures.
2. A central continuous exhaust system is provided incorporating a heat recovery system.
3. Since the suite washrooms are private facilities where only one fixture will likely be used at a time, continuous exhaust at 24 L/s may be used in this instance.
4. The continuous exhaust system will provide for greater air change than normally required.
5. The ventilation system design conforms to ASHRAE 62-1989 and CAN/CSA F326-M91.
6. Suite windows are openable.
7. A separate heat/cooling system is available in each suite.
8. The central kitchen and dining facility within the building reduces the need to utilize individual cooking appliances within the suites.

Dated at Toronto this **14th,** day in the month of **June** in the year **2000** for application number **2000-24**.

Ruling No. 00-27-759
Application # 2000-42

Ontario

BUILDING CODE COMMISSION

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Sentence 2.1.1.7.(2) and Article 9.5.2.1. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Ms. Zena Reinhardt, Owner, Kleinburg Book Company, Kleinburg, Ontario, for the resolution of a dispute with Mr. Mani Navabi, Chief Building Official, City of Vaughan, Ontario, to determine whether the subject commercially-used log house, which was disassembled, rebuilt at another location and provided with a barrier-free path of travel, is required to provide barrier-free accessibility in the proposed new washroom when considering Sentence 2.1.1.7.(2) and Article 9.5.2.1. of the Ontario Building Code at the Murray-Diceman Log House, 10499C Islington Avenue, Kleinburg (Vaughan), Ontario.

APPLICANT	Ms. Zena Reinhardt, Owner Kleinburg Book Company Kleinburg, Ontario
RESPONDENT	Mr. Mani Navabi Chief Building Official City of Vaughan
PANEL	Dr. Kenneth Peaker, Chair Mr. Len King Mr. Fred Barkhouse
PLACE	Toronto, Ontario
DATE OF HEARING	September 21, 2000
DATE OF RULING	September 21, 2000
APPEARANCES	Mr. Paul Reinhardt, Co-owner Kleinburg Book Company Kleinburg, Ontario **Agent for the Applicant** Mr. Steve Penna Technical Supervisor City of Vaughan **Designate for the Respondent**

RULING

1. The Applicant

Ms. Zena Reinhardt, owner, Kleinburg Book Company, Kleinburg, Ontario, has received a building permit under the Building Code Act, 1992 to construct a book store at 10499 Islington Avenue, Kleinburg, Ontario.

2. Description of Construction

The Applicant has relocated and constructed a log house to be used as a book store. The building is two storeys in building height, 96 m^2 in building area, and of combustible construction. The structure is classified as having a Group E - mercantile occupancy.

The building is primarily the reconstitution of an old log house originally built in the 1830s. The Applicant disassembled the log house and rebuilt it at a new location in 1996. The footprint of the building measures the same as the old log house, which is 7.32 m by 5.8 m. For the most part, the current building has been constructed using the original logs. The building has also been provided with a second floor that projects above the footprint of the first floor; a basement containing a washroom; and a wider entrance. In addition, another new washroom is proposed to be installed on the first floor of the building.

The construction in dispute involves the applicability of the requirements for barrier-free accessibility in the ground floor washroom. As part of the work undertaken during the rebuilding of the log house, the Applicant provided a landscaped ramp to the level of the front entrance threshold. The front entrance door opening was also widened. As well, between the door and the proposed washroom is a level path of travel wide enough to be considered as providing barrier-free accessibility. Although the path leading to the proposed washroom is described as being barrier-free, the Applicant is not proposing a barrier-free washroom. She is instead requesting an exemption from this OBC requirement.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the subject commercially-used log house, which was disassembled, rebuilt at another location and provided with a barrier-free path of travel, is required to provide barrier-free accessibility in the proposed new washroom when considering Sentence 2.1.1.7.(2) and Article 9.5.2.1. of the Ontario Building Code (OBC).

According to Sentence 2.1.1.7.(2), where an existing, once occupied, building is relocated or disassembled and rebuilt somewhere else, the OBC provisions apply only to those changes that are required as a result of the new location. These changes would include changes to design, or to the parts of construction, such as a foundation, that might be required at the new site.

The proposed addition of a washroom to the new log house is not a required change resulting from the relocation of the building. It is proposed as a convenience to customers of the book shop. In this respect, the Commission does not regard the proposed washroom as mandatory construction needed to relocate the building and that would be covered by Sentence 2.1.1.7.(2) of the Ontario Building Code. The washroom is considered new construction even though it is located within an existing structure.

Renovations to existing buildings are covered by Part 11 of the OBC. If the washroom was also considered as existing, the work undertaken on other parts of the structure would not, under Part 11 of the OBC, require the installation of a barrier-free washroom. However, in the present case, the

travel up to and into the structure.

New construction for a building of this size is regulated in Part 9 of the OBC. The relevant provision regarding this dispute is Article 9.5.2.1. It states that every building (or part thereof) shall be designed in conformance with Section 3.8., the barrier-free accessibility requirements. The exceptions to this are found in Sentence (2) of Article 9.5.2.1., however, these do not apply to the subject building.

At issue, therefore, is whether the creation of a new washroom in an existing building that is provided with a barrier-free path of travel triggers the applicability of the barrier-free accessible requirements of the OBC for that washroom.

4. Provisions of the Ontario Building Code

Article 2.1.1.7. Existing Buildings

(2) Where an existing previously occupied *building* is moved from the original location to be installed elsewhere, or is dismantled at the original location and moved to be reconstituted elsewhere, the Code applies only to changes to the design and *construction* of the *building* required as a result of moving the *building*.

Article 9.5.2.1. Barrier-Free Design

(1) Except as provided in Sentence (2) and Article 3.8.1.1., every building shall be designed in conformance with Section 3.8.

(2) The requirements of Section 3.8. need not be provided for houses including semi-detached houses, duplexes, triplexes, town houses, row houses and *boarding, or rooming houses* with fewer than 8 boarders or roomers.

5. Applicant's Position

At the outset of the hearing, the Agent for the Applicant stated that, as a businessman without any expertise in the Ontario Building Code, he will discuss the subject matter of the dispute from an economic point of view and hoped the Commission would take his argument at face value. He submitted that the additional cost involved with retrofitting an existing building to meet the new standards imposes a heavy financial burden on small businesses such as the one under dispute.

With regards to its construction, the Agent indicated that, in general, the use of the original materials constrained any structural changes when re-building the log house. They have, however, created an access route to the building that is considered barrier-free as a convenience to their customers. Both a 36.58 m long unobstructed pedestrian path and a ramp have been provided to the level of the threshold of the entrance door. A wider entrance door has also been installed to facilitate this accessibility.

The Agent argued that a prime location for sales in his business is at the entrance area of the first floor. Installing a barrier-free washroom would tremendously reduce the available first floor space that is vital to their business. He argued that, according to his calculations, the addition of a barrier-free washroom to the subject log house would create an annual loss of $3,600 in gross profit. As a result, the owner suggested that they would have to invest $51,430 to make up for this annual loss. He also stated that if they had constructed a new building it would have cost them 20 percent less in the long run.

The Agent continued by advising that, modern standards such as those established for protecting the

consideration the economic cost that would be associated with such a level of performance. As a result, they can do more harm than good as they impose heavy financial burdens on small businesses; many owners are put out of business.

In summation, the Agent added that there has been a mass of modern construction in the City of Vaughan recently and that they felt this type of construction would be appreciated, particularly in the Kleinburg area. He also indicated that it was his hope that the preservation of such an historic structure would have been more appreciated. Lastly, it was his position that there were already barrier-free accessible washroom facilities available at other nearby establishments. Customers would not have to travel far to reach such a facility.

6. Respondent's Position

The Respondent submitted that the disassembled logs have been partially used in the reconstitution of the subject log house. In his view, the building of the book store was entirely new construction under the Code. It simply utilized some existing materials. Moreover, the proposal for the addition of a washroom changes the original design of the building and, therefore, further adds to the rationale as to why the book store should be considered as a new building that should be subject to the OBC provisions regulating new construction. In this instance, the Code requires that a Group E occupancy be provided with barrier-free washrooms, the Respondent noted.

The Respondent advised that they occasionally get complaints from the public regarding the lack of barrier-free accessibility in new buildings. As a responsible authority, it is important for them to provide the public with such facilities. He argued that the monetary cost of compliance should not be considered a reason that would justify exemption from OBC requirements. He further stated that, although he is sympathetic to the Applicant's situation, there is no provision under the OBC that would allow the requested relief.

7. Commission Ruling

It is the decision of the Building Code Commission that the commercially-used log house, which was disassembled and rebuilt at another location, is required to provide a barrier-free accessible washroom when considering Sentence 2.1.1.7.(2) and Article 9.5.2.1. of the Ontario Building Code at the Kleinburg Book Company, 10499C Islington Avenue, Kleinburg (Vaughan), Ontario.

8. Reasons

i) Whereas the reconstructed log house is considered an existing building, the creation of a barrier-free path of travel up to and within the structure means that the proposed new washroom must also, as per Code, be barrier-free accessible.

ii) The Applicant did not offered any alternative proposals that may have allowed the BCC to consider the subject dispute under its powers of determining sufficiency of compliance with the required OBC provisions.

RULING

1. **The Applicant**

   Mr. Rudy Kmetic, Property Owner (prospective), 33 Merkley Square, Scarborough, Ontario, has applied for a building permit under the *Building Code Act, 1992*, to construct a seasonal dwelling and install Class 1, Class 2, and Class 3 sewage systems at 28 Smuggler's Lane, "Chicken Island", Port Franks, Ontario.

2. **Description of Constrution**

   The Applicant has applied for a building permit to construct a Group C - seasonal dwelling which is proposed to be serviced by two alternative combinations of Class 1, Class 2, and Class 3 sewage systems. The proposed dwelling will contain two bedrooms, 4.5 plumbing fixture units and will have a total finished area of 96 m^2. The calculated daily design sewage flow is 900 litres.

   The original proposal was for a Class 1 self-contained composting toilet and a Class 2 leaching pit. After discussion with the Chief Building Official regarding the requirement for a water

closet, the proposal was changed to include (in addition to the Class 2 greywater system) a different Class 1 composting toilet comprising of a one pint (0.568 litre) flush unit and a central composting system to be located under the main floor bathroom and connected to a Class 3 (cesspool) system. This alternate proposed toilet unit would be a "Sealand 510 Travellers" model which is described as meeting the requirements for a water closet in that it is connected to a water supply system and is certified under CAN/CSA B-45 "General Requirements for Plumbing Fixtures". Both the toilet and the composting unit are equipped with vent stacks for the elimination of odours. The effluent from the 4.5 fixture units in excess of the sanitary fixture (the composting toilet) will be directed to the Class 2 greywater system.

The site is one of a limited number of lots on Chicken Island that has received provincial consent for severance and residential development, though under restrictive conditions. The area is accessible only by water and has no municipal services available. Any development that may demand extension of such services is prohibited by the Official Plan due to the fact that the lands on this island are environmentally sensitive.

The lot is described as a cottage property with minimum slope. It is mostly covered with dune grass and scrub vegetation and measures 31 m by 52 m covering an approximate total area of 0.16 ha. The depth to high groundwater table, according to the Applicant, is 1.6 to 3 metres. The percolation time of the native soil is reported to be less than 1 minute per centimetre. No soils evaluations were carried out to determine the percolation time or the specific level of the high groundwater table.

The water supply to the dwelling will be from a well.

The construction in dispute involves the proposed combinations of Class 1, Class 2, and Class 3 sewage systems to serve the subject dwelling unit.

3. **Dispute**

There are two issues at dispute before the Building Code Commission. The first issue concerns the original proposal which consists of a Class 1 self-composting toilet and a Class 2 greywater system. In this case the dispute is whether the construction of Class 1 and Class 2 systems in lieu of a Class 4 septic system to serve the proposed seasonal dwelling complies with Sentence 8.1.2.1.(1), when considering Sentences 7.1.6.1.(1) and 9.31.4.1.(1) of the OBC (Ontario Building Code). The second issue before the commission concerns the subsequent proposal which replaces the self-composting toilet with a one pint flush toilet connected to a Class 3

(cesspool) system. In this case the dispute is whether this proposal provides sufficiency of compliance with Sentences 8.2.1.5.(1) and 8.2.1.4.(2).

With regard to the first issue at dispute, Sentence 8.1.2.1.(1) classifies different types of on-site sanitary sewage systems under the OBC. These systems have been defined under Article 1.1.3.2 and are referred to as private sewage disposal systems in Sentence 7.1.6.1.(1). Every on-site sanitary sewage system classified under the OBC has its own design, construction, installation, operation, and maintenance requirements that are regulated by the OBC. A composting/incinerating toilet system, a greywater system, and a cesspool are among the recognized sewage systems which are regulated under Part 8 of the Code. These systems have been classified, respectively, as Class 1, Class 2, and Class 3 systems under Sentence 8.1.2.1.(1).

Sentence 9.31.4.1.(1) states that a dwelling unit with a water distribution system must be provided with certain fixtures including a water closet. The water distribution system referred to in this sentence is defined as "an assembly of pipes, fittings,... that conveys water from the water services pipe or private water supply system (in this case a private well) to water supply outlets, fixtures, plumbing appliances, and devices" under Article 1.1.3.2. Water closets are one of the required fixtures in a dwelling unit that must be provided with a water connection as stipulated by Sentence 9.31.3.2.(2). The proposed composting toilet is not connected to a water supply system as mandated by this provision.

Sentence 7.1.6.1.(1) requires every sanitary drainage system to be connected to a public sanitary sewer, a public combined sewer or a private sewage disposal system. The sanitary drainage system referred to in this sentence is defined as an assembly of pipes, fittings, fixtures and appurtenances on the property that is used to conduct sanitary sewage to a main sewer or private sewage disposal system. Sanitary sewage means liquid or water borne waste ... of domestic origin, including human body waste, toilet or other bathroom waste, and shower, tub, culinary, sink and laundry waste.

Greywater, on the other hand, is defined as sanitary sewage of domestic origin which is derived from fixtures other than sanitary units. A sanitary unit under the Code means a water closet, urinal, bidet or bedpan washer. Put simply, a water closet is defined as a sanitary unit that not only is connected to a water supply system, but also conducts human body waste to a sewer or private sewage system. However, a Class 2 system is a greywater system designed for effluent other than that originating from human bodies. As a result, a requirement for a water closet in a dwelling unit as stipulated by Sentence 9.31.4.1.(1) generally restricts installation of a Class 2

system. At issue is whether this restriction must be considered while applying Sentence 8.1.2.1.(1) to a seasonal dwelling unit.

With regard to the second issue at dispute, Sentence 8.2.1.4.(2) sets out horizontal clearance distances which must be maintained between Class 1, Class 2, and Class 3 systems and property lines as well as natural features such as wells and lakes. Sentence 8.2.1.4.(2) requires these distances to be increased where the percolation time of the native soil is less than 10 minutes. In this case, the percolation time of the native soil is reported to be less than 1 minute.

No information was provided as to the type of the well (dug or drilled) or the proposed well location. There was no information offered regarding the location or type of wells on adjoining properties. Nor was any information provided regarding the proposed location for the Class 2 and Class 3 (cesspool) systems. However, considering the dimensions of the subject lot (31 m by 52 m), the issue is whether the required setbacks as mandated by the OBC can be met.

4. **Provision of the Building Code**

Sentence 8.1.2.1. - Classification of Systems

1. All sewage systems shall be classed as one of the following:
b. Class 1 - a chemical toilet, an incinerating toilet, a recirculating toilet, a self-contained portable toilet and all forms of privy including a portable privy, an earth pit privy, a pail privy, a privy vault and a compositing toilet system,
c. Class 2 - a greywater system,
d. Class 3 - a cesspool,
e. Class 4 - a leaching bed system,
f. Class 5 - a system which requires or uses a holding tank for the retention of hauled sewage at the site where it is produced prior to its collection by a hauled sewage system.

Sentence 7.1.6.1. - Sanitary Drainage Systems

7. Every sanitary drainage system shall be connected to public sanitary sewer, a public combined sewer or a private sewage disposal system.

Sentence 9.31.4.1. - Required Fixtures

8. In a dwelling unit with a water distribution system, a kitchen sink, lavatory, bathtub or shower stall and water closet shall be provided.

Sentence 8.2.1.5.

9. Except as provided in Sentences 8.2.1.4.(1) and (2), no Class 1, 2, or 3 sewage system shall have a horizontal distance of less than that permitted by Table 8.2.1.5.

Sentence 8.2.1.4.

10. ,

11. Unless it can be shown to be unnecessary, where the percolation time is less than 10 minutes, the clearances listed in Articles 8.2.1.5. and 8.2.1.6. for wells, lakes, ponds, reservoirs, rivers, springs or streams shall be increased to compensate for the lower percolation time.

5. **Applicant's Position**

The Applicant submitted that because of the unique circumstances prevailing on Chicken Island, it is appropriate to use a self-contained composting toilet, thereby avoiding the discharge of contaminants into the soil on an environmentally sensitive area.

The Applicant argued that according to his information, even the best septic or wastewater systems only break down 90 percent of the suspended solids and fecal coliform. Preventing any pollutants from contacting the soil and water by using a composting toilet appears to be the best answer given the soil conditions. The Applicant stated that the Asauble Bayfield Conservation Authority appears to support the original servicing proposal.

The Applicant indicated that he originally wanted a self-contained composting toilet. However, to meet the requirements of having a water closet, he had amended his proposal to include a one pint flush toilet, a different type of composter, and a Class 3 "cesspool" (in addition to the Class 2 system).

With respect to the question of using a Class 4 system, the Applicant argued that installation of an "Ecoflo" system, as recommended by the Respondent, is neither physically nor financially feasible. The area is isolated and only accessible by water which makes both installation and maintenance of the system very difficult and expensive. The seasonal use of the cottage and low sewage flow rate makes installation of such an expensive system even less attractive.

The Applicant concluded that even though he wants to comply with all requirements of the OBC, he would be most satisfied if he is allowed to install an affordable system.

6. **Respondent's Position**

The Respondent submitted that if the proposed composting toilet system meets the requirements for water closets under the Code, then a Class 4 septic system is required under Part 8.

The Respondent argued that under the OBC the proposed dwelling unit must have a water distribution system which in this case will be connected to a potable private water supply. This requires that a water closet conforming to CAN/CSA-B45.0 be provided in the dwelling unit. There is no evidence that shows the proposed composting toilet is certified to this standard. However, if it does, then it is the Respondent's position that a Class 4 sewage system must be installed to serve the proposed dwelling unit.

The Respondent continued that it is the County's planning policy since 1998 that any residential dwelling constructed in this area should be served by an "Ecoflo" system as they have an opinion from the Housing Development and Buildings Branch of the Ministry of Municipal Affairs and Housing regarding the suitability of the "Ecoflo" system for highly permeable soils. As a result, under this policy, any applicant requesting a building permit for residential development is required to install an "Ecoflo" sewage system.

The Respondent concluded that even if the proposed systems are recognized under the OBC, they have no conclusive data about the volume and the quality of the black water that would be discharged from the composting system to guide them about the design and construction requirements of a Class 3 system, nor have they any idea about quality of the greywater that will be discharged to a Class 2 system. For these reasons, they cannot approve the proposed systems.

7. **Commission Ruling**

Ruling 1: It is the decision of the Building Code Commission (BCC) that a composting toilet (Class 1) and Class 2 leaching pit for a seasonal dwelling comply with Sentence 8.1.2.1.(1) and need not comply with Sentences 7.1.6.1.(1) and 9.31.4.1.(1). The conditions for installation are:

1) That the Class 2 leaching pit be at least 5.0 metres from the dwelling to avoid interactions with foundations and drains and to distance the system from the dwelling.

2) That a minimum of 30 metre setback to dug wells and a minimum of 15 metre to drilled wells be provided for the Class 2 system.

Ruling 2: It is also the decision of the BCC that the second proposal, consisting of a one pint flush toilet, a Class 2 greywater system, and a Class 3 (cesspool) system, does not provide sufficiency of compliance with Sentences 8.2.1.5.(1) and 8.2.1.4.(2).

8. **Reasons**

Ruling 1:

(a) A composting toilet is a permitted Class 1 system (Clause 8.1.2.1.(1)(a)). Such a system, if adequately sized, can serve the sanitary needs of a seasonal dwelling.

(b) A Class 1 toilet is considered a suitable alternative for a conventional water closet in serving a seasonal dwelling.

(c) A Class 2 leaching pit is a permitted system (Clause 8.1.2.1.(1)(b)) and compliments a composting toilet for a seasonal dwelling.

Ruling 2:

(a) The panel had concerns regarding the setback requirements for this site. Table 8.2.1.5.(1) requires a 10 metre setback from a "drilled" well and a 15 metre setback from a dug well or other water source to a Class 2 leaching pit. In view of the requirements of 8.2.1.4. for increased setbacks in soils under 10 minutes per centimetre percolation time, a Class 2 system may not be appropriate for this lot. The panel also had concerns that the 15 metre setback to a dug well is inadequate in view of the possible bacteria and chemical components of greywater.

(b) The setbacks to a cesspool (Table 8.2.1.5) are 30 metres to a drilled well and 60 metres to a dug well, plus additional setback required for low percolation time soils (8.2.1.4). The panel expressed doubt about accommodating a cesspool on the lot under consideration.

RULING

1. **The Applicant**

   Mr. Tony Manocchio, Project Manager, Saddlebrook Construction Inc., Downsview, Ontario, has received a building permit under the *Building Code Act, 1992,* and is currently constructing a residential condominium known as the Gates of Bayview Residences -Phase I located at 3 Ellesmare Road, Richmond Hill, Ontario.

2. **Description of Constrution**

   The Applicant is currently building a new condominium residence classified as having a Group C occupancy. The structure is described as eight storeys in building height, 1,563 m^2 in building area and is of noncombustible construction. The building will be equipped with a fire alarm system, a standpipe and hose system and a partial sprinkler system in the basement levels only.

The construction in dispute involves the installation of prefabricated metal spiral stairs in eighteen units with two floor levels. Both levels of the units have a floor area of approximately 30 m^2 and the spiral stairs are the only means of passage between floors. The stairs are not considered as a required means of egress since all such units are equipped with an egress door on both levels leading directly to a public corridor.

The as-constructed stairs are supported by a floor-to-ceiling 100 mm diameter centre steel post. Each stairs is described as having 13 treads that together span a 270^0 total rotation. The clear width between the post and the handrail on the outside of the stair is 780 mm. The tread depth measured directly adjacent to the centre post is 50 mm, excluding the area covered by the overhang from the above protruding step. Measured at 330 mm from the post the tread is approximately 153 mm in depth without the overhang area, and at 381 mm away, roughly the centre line of the stair, it is approximately 160 mm deep, also excluding the overhung portion.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the eighteen sets of as-built spiral stairs, which are not required exit stairs and are measured at 780 mm in width and 50 mm and 160 mm in minimum and average tread depth respectively, are required to comply with Sentence 9.8.3.3.(2) and Articles 3.3.1.15 and 9.8.5.2. of the Ontario Building Code. (While the building in dispute has been constructed according to Part 3 of the OBC, certain stair requirements of Part 9 are applicable because of Article 3.3.4.7. which states that "(s)tairs, handrails and guards within a dwelling unit shall conform to the appropriate requirements in Section 9.8.")

The above provisions set out requirements for stair width and tread depth. Specifically, Sentence 9.8.3.1.(2) stipulates that at least one stair between levels in a dwelling unit shall be a minimum of 860 mm in width. This provision applies to any stair, not just spiral ones. As noted, the Applicant's stairs are 780 mm wide. As well, Articles 3.3.1.15. and 9.8.5.2., both mandate that the minimum run of a curved or spiral stair (although Article 9.8.5.2. refers only to a curved stair) is required to be 150 mm and the average run must be 200 mm. The minimum and average runs of the subject stairs are 50 mm and 160 mm respectively.

Specifically, the issue before the Commission is not whether the as-installed stairs meet the prescriptive requirements found in the OBC regarding stair width and tread depth. Clearly they

do not. Rather, the issue, as presented by the parties, is, as spiral and not curved stairs that are not required for exiting, whether it is necessary that they must conform with Sentence 9.8.3.3.(2) and Articles 3.3.1.15. and 9.8.5.2. of the Building Code.

4. **Provision of the Building Code**

Sentence 9.8.3.3.(2) - Stair Width

1. ,

2. At least 1 stairway between each floor level in a dwelling unit shall have a width between wall faces of not less than 860 mm (2 ft 10 in).

Article 3.3.1.15. - Curved or Spiral Stairs

3. A curved or spiral stair is permitted in a stairway not required as an exit provided the stair has:

(a) treads width

iv. a minimum run not less than 150 mm ($5^{7/8}$), and

v. an average run not less than 200 mm ($7^{7/8}$), and

(b) risers in conformance with Sentence 3.4.6.7.(2).

Article 9.8.5.2. - Curved Stairs not in Exits

6. Except as permitted in Article 9.8.5.3., a curved stair not required as an exit shall have an average run of not less than 200 mm ($7^{7/8}$) and a minimum run of 150 mm ($5^{7/8}$) and shall have risers conforming to Article 9.8.3.1.

5. **Applicant's Position**

The Agent for the Applicant commenced his presentation by noting that the eighteen sets of stairs in dispute are spiral and not curved stairs. He argued that such stairs are not adequately

addressed in the OBC. In his view, the Code requirements for curved stairs are clear but the same cannot be said for spiral stairs. However, he stated that it was important to understand that the OBC does not exclude nor prohibit the use of spiral stairs in the circumstances at hand.

The Agent submitted that the 860 mm minimum width requirement, for example, only makes sense if the stairs are required to be used for exiting and moving furniture. In the present situation neither demand is being placed on the subject stair. As he noted, since there is an egress door leading to a public corridor on both levels of the units individuals could exit from either the upper and lower floor areas directly without using the stairs. Moreover, when moving furniture of any size it would be obvious and, in fact, much easier to take such objects out of the unit, into the corridor and onto the elevator. Therefore the requirement of Sentence 9.8.3.3.(2), he offered, is neither appropriate nor practical in terms of achieving compliance for the subject spiral stairs.

Regarding the issue of tread depth, the Agent argued that since the OBC seems to provide regulatory standards only for circular and curved, but not spiral, stairs it is difficult and in some cases impossible to meet the requirements of Articles 3.3.1.15. and 9.8.5.2. concerning tread depth. Article 3.3.1.15., which he noted is titled "Curved or Spiral Stairs", requires a minimum tread run of 150 mm, but on a spiral stair, which by definition is constructed around a centre support post, meeting such a minimum tread depth is not possible. The same situation holds for compliance with Article 9.8.5.2. as well, he asserted.

As a result, the Agent argued that it would be appropriate to look to model codes such as the National Fire Prevention Association, the Standard Building Code and the Building Officials and Code Administrators code which, in his view, more adequately address the concept of spiral stairs. When assessing the disputed spiral stairs under these model code standards, the Agent stated that they met all requirements (including overall stair width), with the exception of the minimum tread depth of 7 ? inches (191 mm) when measured 12 inches (305 mm) from the centre post. The latter, he explained, is the principle standard that these model codes use in terms of safety requirements for tread runs instead of minimum and average depths.

To mitigate the non-compliance with the 191 mm tread depth requirement, the Agent proposed that a second handrail attached to the centre post be added to the inside of the stairs. This handrail would project 100 mm from the post and would make the stairs safer and would effectively mean that users of the stair would be forced to walk closer to the outside where the tread run is deeper. In fact, he argued that by measuring 305 mm from the outside of the proposed inner handrail, and not the post itself, the prescriptive requirements of 191 mm for

tread depth found in the model codes will be met. While the additional handrail would further narrow the stair, it would reduce the width to 668 mm which still exceeds the minimum of 660 mm set out in the referenced model codes.

In summation, the Agent indicated that since the subject stairs were assembled off-site and lowered into place with a crane as the floor slabs were being poured removing them would be exceedingly difficult and costly. He also noted that the same stairs have been approved by other municipalities, installed in numerous other projects, and used without problem. Lastly, the Agent argued that, in his view, the subject stairs, with the inside handrail, comply with the various model codes and present no safety concerns.

6. **Respondent's Position**

The Respondent submitted that the OBC is very clear on the issues in dispute. Sentence 9.8.3.3.(2) and Articles 3.3.1.15. and 9.8.5.2. are applicable to the subject stairs. And as such, the stair width and the minimum and average tread runs, he argued, were not in compliance. He stated that during an inspection of the stairs (after installation) he found that ascending was not an issue, but descending was unsafe due to the narrow tread runs.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the eighteen sets of as-built spiral stairs, which are not required exit stairs and are measured at 780 mm in width and 50 mm and 160 mm in minimum and average tread depth respectively, are required to comply with Sentence 9.8.3.3.(2) and Articles 3.3.1.15. and 9.8.5.2. of the Ontario Building Code at the Gates of Bayview Residences - Phase One, 3 Ellesmere Road, Richmond Hill, Ontario. The as-built stairs currently do not comply with the OBC in terms of width and minimum and average stair tread dimensions.

8. **Reasons**

. The above provisions are applicable to curved or spiral stairs, even those not required for exiting.

a. The proposed measure of adding a second handrail attached to the centre steel post on the inside of the stairs does not compensate for the deficiencies. In fact, it further narrows the stairs.

RULING

1. The Applicant

Mr. Don Gordon, Head of Design Build, Cooper Construction Ltd., Oakville, Ontario, has received a building permit under the Building Code Act, 1992 to construct an addition to an existing industrial building located at 32 Bodine Drive, Brantford, Ontario.

2. Description of Construction

The Applicant is proposing to extend an existing Group F, Division 3 - Low Hazard Industrial building. The building primarily serves as a used steel galvanizing plant. The existing building is 2,882.5 m^2 in building area, one storey in building height, and of combustible construction. The new addition will occupy an area of 2,856.8 m^2, thereby increasing the total building area to 5,739.3 m^2. The proposed addition will be one storey in building height, of noncombustible construction, and will be equipped with a standpipe and hose system. The maximum occupant load of the entire building is intended to remain at 300.

The proposed roof assembly for the new addition consists of fibreglass reinforced polymer (FRP) roof deck panels, 12.5 mm gypsum board, 25 mm foamed plastic insulation, and a built-up roof membrane. The proposed FRP panels are described as combustible. However, according to the Applicant, the panels meet CAN/ULC-S126-M (Standard Method of Test for Fire Spread Under Roof-Deck Assemblies), the standard for metal roof decks that support combustible materials. As well, with a maximum flame spread rating of 25, the roof deck panels also meet CAN/ULC-S102-M, "Standard Method of Test for Surface Burning Characteristics of Building Materials and Assemblies". (Compliance with this standard is also required since the deck panels are to be installed below the drywall and therefore act as an interior finish.)

The construction in dispute involves the Applicant's proposed use of a combustible material in the roof assembly of the new addition.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed roof assembly, which is to be constructed with combustible fibreglass reinforced polymer panels, provides sufficiency of compliance with Sentence 3.1.5.1.(1) of the Ontario Building Code (OBC).

This provision requires, with certain exceptions which do not apply to the construction in dispute, that noncombustible materials must be used in a building, which under the Code, is required to be of noncombustible construction. The new addition is proposed to be of noncombustible construction except for a portion of the roof assembly. As noted above, the proposed roof assembly is to contain combustible fibreglass reinforced polymer (FRP) panels.

4. Provisions of the Ontario Building Code

Sentence 3.1.5.1.(1) Noncombustible Materials

1. Except as permitted by Articles 3.1.5.2. to 3.1.5.23., 3.1.13.4. and 3.2.2.16., a building or part of a building required to be of noncombustible construction, shall be constructed with noncombustible materials.

5. Applicant's Position

The Agent for the Applicant submitted that the FRP roof panels provide sufficiency of compliance with Sentence 3.1.5.1.(1) of the Code.

The Agent explained that because of the nature of the used steel galvanizing process undertaken in the subject plant, they are trying to limit the amount of material, i.e. metal, that can corrode as a result of fugitive vapours created from the chemical cleansing of steel. During this process, which occurs prior to galvanizing, used steels are put into several baths and rinses containing chemicals such as hydrochloric acid. The vapours from the chemicals are not compatible with metals and cause corrosion. Due to the rising vapours, metal roof panels especially are susceptible to this corrosive effect. As a result, the Applicant intends to use the subject fibreglass reinforced polymer panels.

The Agent stated that while the FRP panels do not meet CAN4-S114, "Standard Method of Test for Determination of Non-Combustibility in Building Materials", they do meet the roof deck (CAN/ULC-S126-M) and the interior finish standards (CAN/ULC-S102-M). Moreover, with as much as 45 percent of the content of the panels consisting of glass - a noncombustible material - the Agent argued that the proposed roof decking offers the highest level of noncombustibility for a combustible material. As well, the roof for the proposed addition, he noted, is not required to be fire rated under Article 3.2.2.82.

The Agent also agued it can be demonstrated that the FRP panel "achieves the performance intent of the Code for a roof material in the context of fire safety in a building. As he stated:

"The Code recognizes that it is not practical to construct a building entirely of noncombustible material. As such, the Code permits certain elements to be of combustible materials in a building required to be of noncombustible construction. None of those exceptions identify a roof deck. However, the Code does establish performance criteria for the roof deck with respect to fire spread and flame spread rating, both of which are met.

"The Code also recognizes, by Sentence 2.7.2.1.(1), that materials which vary from specific requirements in Parts 3, 4, 5, 6, 7, 8 and 9 may be used if the person requesting their use can establish on the basis of past performance, tests described in Article 2.7.2.4., or other evaluation that the use of the proposed material will provide a level of performance that would be achieved by conformance with the requirements of the Code." In other words, materials can also be evaluated to ensure that the intent of the specific Code provision is met. And in the Agent's view, "(t)he intent of the Code for requiring a building to be constructed of noncombustible materials is to preclude those materials from contributing to the fire load of a building and directly causing the spread of fire." The Agent then turned his attention to tests conducted on the FRP panels regarding their fuel contribution and fire spread.

In terms of these tests, the Agent stated that they "indicate that the FRP roof deck material contributes minimally to the building's fire load and does not directly contribute to the spread of fire beyond the area of flame impingement. A FRP roof deck assembly is rated as a Class 1 roof assembly by FMRC (Factory Mutual Research Corporation). This classification is based on a metal roof deck."

The Agent noted that if a metal sheet was placed between the decking and the drywall, and if that sheet were called the deck, then there would be no dispute. He indicated, however, that such a metal sheet would not improve the fire safety of the proposed roof system because it already meets all the appropriate performance requirements. And in the case of the subject galvanizing plant, with its corrosive vapours, installing a metal sheet might create a less appropriate roofing system.

The Agent concluded that while the FRP roof panels are considered combustible, the FRP roof panels provide sufficiency of compliance with the performance intended by the Code for a roof deck that is not required to be fire rated.

6. Respondent's Position

The Respondent chose not to attend the hearing. The Commission therefore relied upon his written submission only.

The Respondent submitted that they do not accept the proposed FRP roof deck as noncombustible material as it has not been tested to CAN4-S114, nor has it been listed as an acceptable combustible material to be used in noncombustible construction under the Code.

The Respondent argued that under the Code noncombustible construction is defined as " that type of construction in which a degree of fire safety is attained by the use of noncombustible materials for structural members and other building assemblies". The Code also defines "noncombustible" as material that meets CAN4-S114 standards. There is no evidence or submission that indicates the proposed roof panels meet the acceptance criteria of CAN4-S114. As a result, the proposed material cannot attain the performance level of noncombustible material, the Respondent concluded.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed roof assembly, which is to be constructed with fibreglass reinforced polymer panels, provides sufficiency of compliance with Sentence 3.1.5.1.(1) of the Ontario Building Code.

8. Reasons

i. Moisture protected, fire rated 16 mm (5/8 in) drywall is incorporated into the roof design.
ii. Life safety in the proposed addition is not reduced due to the presence of FRP panels.
iii. The performance criteria for a roof that supports a combustible material has been met.

RULING

1. The Applicant

Mr. Carlos Goncalves, President, Westhaven Homes Inc., 60 North Centre Road, London, Ontario, has applied for a building permit under the Building Code Act, 1992 to construct a new building for operation by Participation House Support Services, at Lot 19, 1832 Louise Boulevard, London, Ontario.

2. Description of Construction

The Applicant is proposing to construct a new building intended to be owned and run by Participation House Support Services, an agency whose mandate is to provide services to persons with diminished mental and/or physical capacities. The building would provide accommodation for four individuals described by the Applicant as "ambulatory persons with disabilities." The structure would be one storey in building height, 180 m^2 in building area and of combustible construction. The building is proposed to be constructed as a single detached, four bedroom dwelling in accordance with Part 9 of the OBC. It is to be equipped with a fire alarm system, but not a sprinkler system.

The construction in dispute involves the occupancy classification of the subject structure and therefore, the Code requirements to be applied in the design and construction of the building. The Applicant purports that the use of the building falls under the definition of a Group C residential occupancy while

the Respondent asserts that the classification is more appropriately defined as a Group B, Division 3 care occupancy.

3. Dispute

There are potentially two issues at dispute between the Applicant and Respondent. The principal dispute between the parties is whether the intended use of the proposed building, as a home for ambulatory individuals with disabilities, complies with the definition of "Residential Occupancy" as set out in Article 1.1.3.2. of the Ontario Building Code at the subject location. The latter dispute is dependent on the outcome of the main issue. If it is ruled that the subject building is a B3 occupancy, then the secondary question is whether it conforms to the conditions in Article 3.1.2.5. and thus can be considered as a residential occupancy.

As the chief dispute pertains to the occupancy of a building, specifically which OBC category is applicable, it is appropriate to examine the occupancies to which the parties argue that the subject building belongs. The Applicant has stated it is his belief that the proposed facility should be classified as residential. "Residential Occupancy" is defined in Article 1.1.3.2. of the OBC as the use of a building where sleeping accommodation is provided but where occupants are not harboured or detained involuntary or otherwise to receive medical care or treatment.

The Respondent, on the other hand, disputed the application of "Residential Occupancy" and indicated that the definition in Article 1.1.3.2 that most appropriately describes the use of the building is "Care Occupancy" (Group B, Division 3). This occupancy would include persons receiving special or supervisory care because of cognitive or physical limitations, but does not include a dwelling unit. Dwelling unit is also a defined term in the Code. This definition is set out in the following section. Significant for our purposes, however, is that a dwelling unit is a space used as a domicile and is operated as a "housekeeping unit".

The nature of this dispute is fundamental for the construction of the building. Indeed, whereas the Ontario Building Code is a document that regulates physical structures and not human behaviour and activity, occupancy and use is nevertheless at the root of appropriate construction. Therefore, in order to correctly prescribe building regulations for a structure, how persons intend to use that structure and what its function will be must be determined. To a large degree, the use and purpose of a building dictate its associated hazard and thus the risk to the occupants. The varying levels of construction standards in the OBC are, in turn, based partially on the potential hazards inherent with certain uses.

Occupancy classification then is an essential step in determining the construction requirements for a building. In this regard, the OBC requires that all buildings be classified "in accordance with every major occupancy for which the building is used or intended to be used." (A-3.1.2. Use Classification) For a proposed building, therefore, occupancy categories are based on intended use of the structure. The Applicant has indicated the following about the intended use of the building:

The building in question is to be used by ambulatory individuals with disabilities and will be operated by Participation House Support Services under the direction of the Ministry of Community and Social Services. According to the Applicant, the building, designed as a four bedroom, single detached dwelling is intended to look as compatible as possible with the neighbourhood in which it is situated. In this manner, the main design objective is to achieve a typical residential setting for the occupants. The Applicant has also indicated that the residents would not be harboured or detained in any way. No reference was made, however, to the type or level of care or supervision that may be provided by the operator, if such care or supervision is to exist.

Upon analysis of the above definitions, the BCC begins with the premise that residential occupancies are comprised of one or more dwelling units. From this basic assumption, it is possible to see the definition of residential and care (B3) occupancies as attempting to be mutually exclusive of one another within the OBC. To elaborate, as we have assumed, a residential occupancy must contain (a) dwelling unit(s). Moreover, a residential occupancy must not contain persons "harboured or detained to receive medical care or treatment...". In contrast, a care occupancy contains persons that receive "special or supervisory care because of cognitive or physical limitations...". As well, it specifically does not include a dwelling unit.

As stated in the Technical Background Information memo written for this application by the Housing Development and Buildings Branch of the Ministry of Municipal Affairs and Housing:

"Within these definitions, the Code draws a distinction between occupancies containing sheltered occupants who receive special care or supervision and those occupancies containing persons who exercise independent control over their accommodation."

The BCC agrees with this assessment. We hold that the receipt of special or supervisory care or the lack thereof, and the degree of independent control exercised within the accommodation are the principal distinctions between residential and care occupancies.

To reach a classification then of the proposal, it is necessary to employ certain tests that will provide a determination. Based on the above described distinctions between Group C and B3 occupancies, the relevant tests are:

1) Will the occupants of the proposed building receive care?
   And;
2) Will the occupants reside in a dwelling unit operating as a housekeeping unit (which infers that occupants are able to exercise a degree of control over their suite) to receive such care?

If the answer to the first question is no, the occupancy should be considered residential. However, if the answer to the first is yes, then the second test must be applied. If the latter question receives an affirmative response, the occupancy is still likely Group C. If it is not considered a dwelling unit, however, the occupancy is most appropriately described as B3. On this basis and using this approach, the BCC will examine the evidence.

If, after occupancy is determined, the proposed structure is a B3 occupancy, the BCC must then address the secondary question regarding whether the proposed building meets the conditions set out in Article 3.1.2.5. This provision permits, under certain conditions, that some B3 occupancies may be classified and constructed as residential occupancies. The conditions are that the occupants must operate as a single housekeeping unit, that there is sleeping accommodation for no more than ten persons and that no more than two persons would require assistance to evacuate in case of an emergency. The Applicant has indicated that there would be a total of four "ambulatory persons with disabilities" housed in the structure, however, no specifics were available with respect to the nature of the resident's disabilities. It is also not clear whether the occupants will function as a housekeeping unit.

4. Provisions of the Ontario Building Code

Article 1.1.3.2. Defined Terms

(1) The words and terms in italics in this Code have the following meaning for the purposes of this Code, and where indicated, the following meaning for the purposes of the Act as well.

Care Occupancy (group B, Division 3) means an *occupancy* in which persons receive special or supervisory care because of cognitive or physical limitations, but does not include a *dwelling unit*.

Dwelling Unit means a *suite* operated as a housekeeping unit, used or intended to be used as a domicile by 1 or more persons and usually containing cooking, eating, living, sleeping and sanitary facilities.

Residential Occupancy means the *occupancy* or use of a *building* or part thereof by persons for whom sleeping accommodation is provided but who are not harboured or detained to receive medical care or treatment or are not involuntarily detained.

Article 3.1.2.5. Group B, Division 3 Occupancies

(1) Group B, Division 3 occupancies are permitted to be classified as Group C major occupancies provided:

(a) the occupants live as a single housekeeping unit in a dwelling unit with sleeping accommodation for not more than 10 persons, and

(b) not more than 2 occupants require assistance in evacuation in case of an emergency.

Article 9.10.2.2. Custodial and Convalescent Homes

(1) Children's custodial and convalescent homes for ambulatory occupants living as a single housekeeping unit in a dwelling unit with sleeping accommodation for not more than 10 persons is permitted to be classified as residential occupancies.

5. Applicant's Position

The Agent for the Applicant submitted that the main issue involves a question of interpretation. He suggested that the classification of a building is the first and most important step in the application of the Building Code. In his opinion, there is no question that the intended use of this building meets the definition of "Residential Occupancy" outlined in Article 1.1.3.2. of the Code. As a result, he submitted that, under Sentence 2.1.1.3.(1) of the OBC, the Part 9 construction requirements, and not those in Part 3, should apply.

In support of his opinion, the Agent submitted that the operators have confirmed that they do not harbour or detain individuals for care or treatment. Instead, Participation House Support Services will provide housing for ambulatory individuals with disabilities in a residential "home" environment as opposed to an institutional setting. The Agent submitted that "(t)he residential setting must model as close as possible a typical home environment. This direction is supported by the Ministry of Community and Social Services and Ministry of Health policy directions for community integration and de-institutionalization." As a result of this directive, the building will be located in a residential neighbourhood and has been designed as a four bedroom, one storey, single detached dwelling, using the Code requirements found in Part 9 of the OBC.

In terms of the occupants of the dwelling, the Agent noted the residents are free to come and go as they please. Their freedom is restricted only by the measure of assistance that they may require. Moreover, there are no written guidelines or restrictions to dictate the nature of the disability an individual may have. In addition, the Agent advised that the house will not be staffed by nurses nor are the residents intended to be supervised. There will, however, be a 24 hour staff on site that may provide assistance when required.

The Agent concluded by stating that there is no compelling reason to link this building with a Group B, Division 3 use. The definition of "Residential Occupancy", as outlined by the Code, is applicable to every facet of this proposal. In addition, he advised that it was not necessary to refer to the provisions of Article 3.1.2.5. of the Code, that outline the requirements that would permit a Group B, Division 3 occupancy to be classified as a Group C occupancy. The use of this building already clearly conforms to the residential occupancy classification and no further consideration should be required. However, if the Commission were to conclude that the building is classified as B3, they meet the criteria specified in Article 3.1.2.5., he argued.

6. Respondent's Position

The Respondent submitted that, although a residential home is being built by Westhaven Homes Inc., it will be sold to and operated by Participation House Support Services, "a care provider under the direction of the Ministry of Community and Social Services." This operation involves some form of care for the occupants and, as a result, "the code requires the building to be designed to the most restrictive classification." In this regard, he has considered it to be a Group B, Division 3 care occupancy when considering the definitions listed in Article 1.1.3.2.

As a B3 occupancy, the Respondent then considered the building under Article 3.1.2.5. of the OBC. This would permit a B3 occupancy to be considered as a Group C occupancy, provided

that; a) the occupants live as a single house keeping unit, b) sleeping accommodation is limited to 10 persons and, c) not more than two persons require evacuation assistance. The Respondent advised that not enough information was available for them to accurately assess whether those conditions were met in this instance. They contended therefore that the classification remains as a B3 care occupancy. This classification would provide the appropriate level of life safety to the occupants of the building.

The Respondent raised several additional issues for consideration, including, the applicability of prior court rulings on similar cases; lack of control over the future occupants of the building and the nature of their disabilities, and; lack of information available to the Applicant from the care operator and, in turn, the Respondent in respect to the level of assistance required by the occupants and level of care to be provided at the facility.

The Respondent acknowledged that the construction requirements for a B3 occupancy are more onerous, specifically the building must be sprinklered and provided with upgraded fire separations. It was suggested that it may be appropriate for the Commission to recommend a Minister's Ruling that would allow an owner to forego the fire separation requirements for a Group B, Division 3 occupancy, provided that such buildings have a maximum building area of 200 m^2, a maximum occupancy of 10 persons, full sprinklering and a fire alarm system. The Respondent noted that there is no requirement in the OBC for a fire alarm system in a B3 occupancy containing not more than 10 persons.

In summation, the Respondent argued that their position remains that the building is most appropriately defined as containing a Group B, Division 3 care occupancy. This position is based on the nature of the operation and the known service offered, the potential limitations of the occupants of the building, and the lack of information available to reach any alternative conclusion.

7. Commission Ruling

The following are the decisions of the Building Code Commission regarding the Westhaven Homes Residence, Lot 19, 1832 Louise Boulevard, London, Ontario:

i. The intended use of the proposed building, as a home for ambulatory individuals with disabilities does not comply with the definition of "Residential Occupancy" as set out in

Article 1.1.3.2. of the Ontario Building Code, and, as a result, the Care, or B3, occupancy is considered the most appropriate classification; and further,

ii. The proposed structure fails to meet the conditions set out in OBC Article 3.1.2.5. and therefore is not permitted to be classified as residential.

8. Reasons

Re: Determination Between Groups C and B3 Occupancies

a. The proposed occupancy is not considered residential because care is to be provided to the occupants. At least one staff person will be available to provide assistance, if necessary, 24 hours a day.
b. The building will be operated as a non-profit business providing services for the rehabilitation of patients. Since the occupants will require and receive supervisory care from the operator, the building should be classified as a care occupancy.
c. The occupants will seem to have less control or influence over their environment within the proposed building as would persons owning, renting or simply occupying a house, an apartment or a condominium unit. The future occupants are to be residents in a facility where care is provided. The living arrangement therefore cannot be considered as a housekeeping unit. Operating as a housekeeping unit is essential for a suite to be considered as a dwelling unit and thereby a residential occupancy.

Re: Application of Article 3.1.2.5.

d. The evidence presented did not indicate that the operator of the facility could guarantee over the long term use of the building that no more than two persons would require assistance in the event of an emergency evacuation.
e. As stated in reason "c" above, the occupants will not operate as a housekeeping unit.

Dated at Toronto this **25th** day in the month of **May** in the year **2000** for application number **2000-26**.

BCC Ruling No. 00-22-754

BUILDING CODE COMMISSION DECISION ON B.C.C. No. 00-22-754

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992. AND IN THE MATTER OF Article Article 3.2.8.9 and Sentence 3.2.8.4.(4) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Greg Varrette, Project Co-ordinator, Thomas Fuller Construction Co. Ltd., 2700 Queensview Drive, Ottawa, Ontario for the resolution of a dispute with Ms. Terry Dalkowski, Chief Building Official, City of Nepean, to determine whether the 45 m travel distances in the existing portions of the building, which are not to be protected by a 2 hour rated wall at the proposed atrium, provide sufficiency of compliance with Sentence 3.2.8.4.(4) of the Ontario Building Code (OBC), and whether the proposed smoke management system designed in conformance with NFPA 92B, "Guide to Smoke Management in Malls, Atria and Large Areas", and intended for the atrium to be constructed adjoining to the existing building, provides sufficiency of compliance with Article 3.2.8.9. of the OBC, at JDS Uniphase, 3000 Merivale Road, Nepean, Ontario.

RULING

1. The Applicant

Mr. Greg Varrette, Project Co-ordinator, Thomas Fuller Construction Co. Ltd., Ottawa, Ontario, has applied for a building permit under the Building Code Act, 1992 to construct a new addition consisting of an office structure and a large atrium onto an existing office-industrial complex known as JDS Uniphase, at 3000 Merivale Road, Nepean, Ontario.

2. Description of Construction

The Applicant is proposing to construct a three storey office structure and multi-storey atrium onto an existing four storey office-industrial complex that serves as the corporate world headquarters for JDS Uniphase, a producer of fibre optic components. The existing building, which initially commenced construction in 1998, has been built in three phases. Phases 1 and 2 are both four storey office-industrial areas that combine administration and manufacturing within each. Located to the south-east of phases 1 and 2 is phase 3, which is currently under construction. It too is a four storey office-industrial area. The proposed construction is designated as phase 4 and, as office space only, will be used exclusively for administration purposes. Also proposed is an atrium to be located in the centre of all four phases that

will effectively join these areas together to form a new, larger building. (The phases of the existing building were previously connected by common service and office areas and walkways.)

The existing complex, phases 1 to 3, is currently classified as having Group D (business) and Group F - Division 3 (low hazard industrial) major occupancies. The completed building, with the proposed addition, will have the same classifications. Including phase 4, the total building area for the entire structure will be 21,000 m2 and the building height will be four storeys. The building is, and will be, of noncombustible construction and is to be fully sprinklered with a supervised and monitored system and equipped with a standpipe and hose and fire alarm systems throughout.

A smaller, full height atrium, known as the Executive Atrium, is also proposed to be included within the new phase 4 administration building. This atrium will fully comply with OBC requirements for interconnected floor spaces in Subsection 3.2.8. and will feature "the provision of smoke detectors and baffles at floor openings, limited travel distance, and exhaust at a rate of 6 air changes per hour from the top of the atrium." This atrium is not in dispute.

The proposed construction of the large atrium space, however, has implications for the existing building. Construction of the atrium facility (the opening of which complies with the minimum size requirements for openings in floor assemblies found in Article 3.2.8.3. of the OBC) means that some of the existing exterior curtain walls in the phase 1, 2 and 3 three portions will become interior walls adjoining the atrium space. As these walls are comprised mostly of fixed laminated glass panels, they are considered unrated assemblies and will act as smoke separations only. Without a continuous and rated fire separation between the atrium and the existing areas, the floor levels of the office and manufacturing portions will thus become interconnected floor space with the atrium. This creation of an interconnected floor space situation raises two main areas of dispute.

The first deals with the travel distances in the existing building. The travel distances in these areas of the sprinklered building have been designed and built to meet the OBC requirements for Group D and F3 occupancies for a floor space not considered to be interconnected, which in this case is 45 m for both. (Clause 3.4.2.5.(1)(c) permits the travel distances to be increased to 45 m in a sprinklered building of these occupancies, however, Sentence 3.2.8.4.(4) waives this increased travel distance.) The Applicant is proposing that these existing travel distances, even though they are now in an interconnected floor space, remain unchanged. The only modification intended for the existing portions of the building is decommissioning of certain stairwells that will no longer discharge to the exterior due to the pending construction of the central atrium. It is proposed that the decommissioned stairs will act as communication and circulation facilities. (It should be noted that the phase 4 administration building

will be built to comply with the interconnected floor space requirements of OBC Subsections 3.2.8., including the maximum travel distance of 40 m permitted in Sentence 3.2.8.4.(4) for a Group D occupancy in a sprinklered building on an floor area in an interconnected space.)

The second area of dispute raised by the construction of the proposed atrium concerns the smoke management within the interconnected floor space area. This dispute specifically relates to the existing phases 1 to 3 and the large atrium. (Whereas the phase 4 area is considered to be within the larger interconnected floor space with respect to the central atrium, this phase has been designed to meet the requirements for interconnected floor space as mandated in Subsection 3.2.8. of the OBC. Therefore, as new construction, phase 4 will be equipped with a zoned smoke management system as per Article 3.2.8.9.) Due to the construction difficulties involved in retrofitting the existing building's HVAC system, and because of the sheer volume of air space in the proposed large atrium, the Applicant is intending to offer an alternative smoke management system than that required by Code for the interconnected floor space area. The major features of this smoke management system, as described by the Applicant, are as follows:

- "smoke exhaust from the top of the atrium at a rate as specified by NFPA 92B"; (The exhaust rate for the atrium area only, as proposed, is 224 489 m3/hour which is approximately four air changes per hour for that 56,633 m3 space.)

- "no zoned smoke exhaust for existing floor areas which are smoke separated from the atrium"; and,

- "automatic and manual operation of all fans and controls associated with atrium exhaust. Manual activation capability of supply fans serving existing floor areas at 100% outdoor air, so as to provide positive pressure of a floor area in the even (sic) that a fire within the atrium causes glazing to break."

To achieve compliance with the Code with respect to the above referenced items in dispute, the Applicant is offering the following package of safety features in the building:

- "existing exterior walls and glazing to remain in place to act as a smoke separation between the atrium and existing floor areas;

- "closely spaced pendant quick response sprinklers to be installed around the interior of the atrium at the level of the 2nd floor slab to respond to fires originating in the atrium in close proximity with the atrium walls; (and,)

- "smoke exhaust from the top of the atrium in accordance with the engineered design criteria of NFPA 92B."

(It should be noted that while the smoke management of the interconnected floor space is an issue at dispute, the Applicant is not simply offering the NFPA 92B system as an alternative to the Code's prescriptive smoke management requirements but also as a proposed measure to relieve the travel distance deficiency.)

The Applicant is also providing smoke detection in various parts of the building. Specifically, smoke detectors are to be installed within the second and third floor circulation spaces of the new administration building as well as at the top of the large atrium. These latter detectors are to operate the atrium's smoke management system. No detection is proposed to be installed on existing floor areas at the fixed glazing overlooking the atrium. This is because it is anticipated that the glazing will prevent smoke caused by a fire originating in the existing areas from entering into the atrium. (Except, of course, when a fire begins in the immediate vicinity of the glazing and breaks the glass separation. In this scenario, however, according to the Applicant the atrium smoke management and detection systems and the remainder of the glazing would perform as if the fire occurred within the atrium itself.)

3. Dispute

There are two disputes between the Applicant and the Respondent. The first is whether the 45 m travel distances in the existing portions of the building, which are not to be protected by a 2 hour rated wall at the proposed atrium, provide sufficiency of compliance with Sentence 3.2.8.4.(4) of the OBC. The second is whether the proposed smoke management system designed in conformance with NFPA 92B, "Guide to Smoke Management in Malls, Atria and Large Areas", and intended for the atrium to be constructed adjoining to the existing building, provides sufficiency of compliance with Article 3.2.8.9. of the OBC. (The aforementioned Code provisions are applicable to the existing building since it has been constructed in phases over the last two years and is therefore not eligible to be considered under Part 11 of the OBC, in particular the alternative measures provision contained therein.)

The first provision, Sentence 3.2.8.4.(4), stipulates that the increased travel distance to exits provided by Clause 3.4.2.5.(1)(c) for a sprinklered floor area does not apply to space within a building above ground level even though sprinkler protection is provided if that same area is within an interconnected floor space. In essence, the effect on the travel distance requirements due to the inclusion of the interconnected floor space within the subject building is as if it did not contain sprinklering, and thus the existing portions of the facility no longer qualify for the extension in permitted travel distance.

As a result, the maximum travel distance permitted for such floors above the ground level is 40 m for the Group D occupancy areas and 30 m for the Group F3 occupancy areas, as based on Clauses 3.4.2.5.(1)(b) and 3.4.2.5.(1)(f) respectively. As noted, the existing travel distances on certain floors of phases 1, 2, and 3 for both administrative and manufacturing areas is 45 m. To compensate for this perceived deficiency, the Applicant is offering certain measures of compensation as outlined in the previous section.

Article 3.2.8.9., the second provision in dispute, requires in Sentence (1) that a smoke control system, designed in conformance with the provisions of the remainder of the Article (Sentences (2) to (8)), be incorporated in a building with an interconnected floor space. Within Sentences 3.2.8.9.(2) to (8) two different types of smoke management systems are set out. Sentence (4) describes a system of zoned smoke control, whereas Sentences (6) and (7) outline a total smoke control system.

The differing characteristics of these systems is that a zone-type smoke control system provides for air exchanges at a rate of six times an hour from the zone in which the fire was detected and that smoke is prevented from moving from one zone to another. With a total smoke control system, on the other hand, air is mechanically exhausted not from individual zones but from the top of the interconnected floor space at a rate of six times an hour, unless the volume of space exceeds 17,000 m3 (600,000 ft3) in which case the air exchange rate need only be four times an hour. Since phases 1 to 3, at 260,513 m3 (9,200,000 ft3), and the large atrium, at 56,633 m3 (2,000,000 ft3), consist of a total of 317,145 m3 (11,200,000 ft3), the subject interconnected floor space far exceeds the threshold which permits four air changes an hour.

However, to install either type of smoke control system in the existing parts of the building would be difficult for the Applicant to achieve. As he stated:

"Both of the two prescribed smoke management options of the OBC would require extensive modifications to the existing air handling systems in the existing buildings. In addition to many smoke dampers, special controls for the operation of the fans would be required. The existing fan and duct sizes in Phase 1 are not suitable for the required air exchange rate. The Phase 1 air handling system would be required to be reconstructed. Where the process air handling system of Phase 2 could be used to accomplish the objective, substantial modifications of the existing building would be required to cover all areas of the floor.

"As such, the introduction of one of the prescriptive options of the OBC would cause significant construction difficulty and business interruption."

As a result, the Applicant has proposed the previously described alternative system of smoke management that he believes is equivalent to those articulated in the prescriptive requirements of the Code.

At issue, therefore, is whether the proposed smoke management system for the atrium which is not prescribed nor recognized by the Code, and the proposed compensating fire safety measures, as specified, offered in lieu of reducing the travel distance within the interconnected floor areas provide sufficiency of compliance with the OBC.

4. Provisions of the Ontario Building Code

Sentences 3.2.8.4. Exits

4. Except where exits serving the floor area are at ground level, the increased travel distance to exits permitted by Clause 3.4.2.5.(1)(c) shall not apply to a floor area within an interconnected floor space.
5. Where a portion of a floor area is not within an interconnected floor space, required access to exit from such portion of a floor area shall not lead through an interconnected floor space.

Article 3.2.8.9. Smoke Control

1. A smoke control system conforming to Sentences (2) to (8) shall be designed to control the movement of smoke within a building containing an interconnected floor space.
2. The design of the smoke control system shall assume an outdoor temperature equal to the January design temperature on a 2.5% basis.
3. Upon activation of the sprinkler system or automatic detection of smoke by at least two smoke detectors in a single zone within an interconnected floor space, the system shall
    a. stop air moving fans which provide for the normal exhausting or re-circulating of air in an interconnected floor space,
    b. activate exit stair shaft protection required in Article 3.2.8.4.,
    c. activate elevator protection required in Article 3.2.8.5., and
    d. activate the vestibule air supply required in Sentence 3.2.8.6.(1).
4. A building containing an interconnected floor space may be designed so that, in the event of a fire arising in a floor area or part of a floor area within the interconnected floor space, automatic detection of such fire will activate air handling equipment that
    a. extracts air directly from such floor area or part of a floor area at the rate of at least 6 air changes per hour, and

b. supplies air in sufficient quantities and at appropriate locations to prevent smoke from passing out of such floor area into other portions of the interconnected floor space.

5. For purposes of Sentences (6) and (7), the volume of an interconnected floor space need not include the aggregate volume of those floor areas or portions of floor areas designed to have zoned air extraction in accordance with Sentence (4).
6. A mechanical exhaust shall be provided to remove air at the top of an interconnected floor space at the rate of at least 6 air changes per hour, except that where the volume of the interconnected floor space exceeds 17 000 m3 (600,000 ft3), only 4 air changes per hour need be provided.
7. Except where zoned mechanical exhaust described in Sentence (4) has been activated, upon automatic detection of smoke within the volume of the interconnected floor space, the mechanical exhaust described in Sentence (6) shall be automatically activated and supply air shall be provided in sufficient quantity and at appropriate locations to allow a consistent rate of removal of smoke throughout the volume of the interconnected floor space.
8. Overriding manual controls for the smoke control system shall be provided for fire department use at an acceptable location in the vicinity of the fire alarm annunciator.

5. Applicant's Position

A the outset, the Agent for the Applicant submitted that the introduction of an atrium space into the JDS Uniphase building does not compromise the level of safety afforded to the building's occupants. He offered the following arguments to support this assertion.

Prior to this, however, the Agent offered some background information about the subject complex. He noted that phases 1 and 2 are completed and occupied and the construction of phase 3 is well under way. He also noted that phase 4, with its Executive Atrium, will comply in full with the requirements of the OBC. The Agent indicated that the exterior walls of phases 1 to 3, which are to become interior walls, were built to the appropriate construction requirements at the time. He further described the building as having a substantial portion dedicated to office use and that the manufacturing done in the facility produces high-tech electronic components, specifically fibre optics switching cable. This production is highly controlled and not very combustible, he stated.

Regarding the issue of travel distance, the Agent began his argument by noting that "technically" the existing floor areas in phases 1 to 3 are considered as being part of the interconnected floor space, however, this space will be physically separated from the proposed large atrium by the existing walls. And while these walls are not rated, they will act as a screen to control the movement of smoke. This function will be greatly enhanced by the proposed NFPA 92B smoke management system, he argued.

Because this system vents out through the roof of the atrium, smoke from a fire on an existing floor area that breaks the smoke screen, or smoke from a fire that originates in the atrium itself, will be expelled to the exterior before it spreads to other parts of the building. In this way, the Agent noted that their NFPA 92B alternative solution regarding the smoke management dispute is also intended as a compensating measure for the travel distance issue.

The Agent then described the serious construction challenges that would be faced if they had to retrofit the existing portions of the building to comply with the reduced travel distance requirements for interconnected floor spaces. In order to meet the 40 and 30 m travel distances for the Group D and F3 occupancies respectively, fire rated exit corridors would have to be extended deep within certain floor areas so as to shorten the access to exits routes. The cost of doing this would be significant, he stated. Besides, according to their calculations the majority of the disputed floor area (roughly 55%) is Group D office and administrative space, which is only 5 m over the required distance, he noted. Additionally, the Agent argued that F3 occupancies, especially the subject one, are not much more hazardous than D, and the Code recognizes this by permitting similar travel distances for these uses in some circumstances. And since the manufacturing done in this building is quite safe, the lesser distance of 30 m instead of 40 m seems onerous in this instance.

The Agent continued that even if access to exits routes in the affected floor areas could be reduced, it would not quicken the evacuation time because of the width of the exit doors provided on each floor area. As he explained, exit time is comprised of not only the time it takes to get to an exit or access to exit door, but also of the time it takes to get through the door in question. Because, in an emergency, other occupants of a floor area have also moved to the exit door a queue of people will form. The time it takes for this queue to pass through the exit must be added to the time it took to travel across the floor area to the exit. In the case of the subject building, when considering the occupant load, the existing travel distance and, most critically, the width of the access to exit doors, the Agent argued that the overall time to exit would still be approximately the same. In other words, the queue that would form as a result of the width of the exit doors would take sufficient time to funnel through that it would negate the additional travel distance currently in dispute.

In addition, the Agent argued that the entire existing floor space, both D and F3 occupancies, are sprinklered. This will greatly contribute to the safety of those areas and would lessen the hazard of the extra distance required to travel.

On the issue of the proposed smoke management system, the Agent stated that both the solution for atrium (the NFPA 92B system) and the existing building (the smoke screen and the various sprinkler

protection) must be viewed as a comprehensive fire safety package. As such, he argued that the total proposal addresses the building - both existing and new - in its entirety (except of course for the phase 4 area). The Agent indicated that he hoped the BCC would assess the project in this holistic fashion. He then described both elements of the proposal.

Because of the sheer volume of air in the atrium and phases 1 to 3 (over 300,000 m3) that the OBC requires to be vented for smoke management purposes, the Agent explained they felt it prudent to explore other alternatives. For the atrium, NFPA 92B was a logical choice since it provides a standard for smoke control in large atria space and offers more flexibility in design than the OBC. Moreover, the principles of the NFPA 92B standard are essentially the same as those in the Code, the Agent argued. Specifically, the methodology of NFPA 92B also follows an engineered approach for smoke management that calculates the maximum rate of exhaust required to maintain the smoke interface above a prescribed level. This is done by predicting the maximum fire size and consequent smoke production likely to happen within a floor area. As part of the smoke production calculation, the NFPA formula takes into account the accompanying sprinkler system and its limiting of smoke generation by suppression of fire. In short, the Agent explained, the approach of NFPA 92B is to curtail smoke generation and propagation by limiting the size of fire through suppression and by providing an equilibrium for the smoke layer interface by exhausting smoke at a rate at which it is supplied by the fire.

The Agent then explained that they created a series of scenarios regarding differing locations for a fire to originate with respect to the atrium. According to their calculations, the worst case scenario was a fire that originated close to the floor level of the atrium. In this scenario, the largest fire size within the atrium would be over 8,000 Btu/second and would take 430 seconds before sprinkler activation. Such a blaze would require approximately 3,734 m3/min (132,000 ft3/min) of exhaust from the top of the atrium. As the Agent noted, this is the same exhaust evacuation rate that they have proposed for this space.

The Agent continued that the NFPA 92B standard also assumes that any potential fire would occur on a single floor area, and not on more than one area simultaneously. This assumption also applies to the relationship between the floor areas and the atrium, i.e. the smoke management system is designed assuming that a fire would not occur in a floor area and concurrently in the atrium. This is a significant assumption in terms of the comprehensive approach of the proposal, the Agent noted, and it supports the concept that the existing and new portions of the building are taken in conjunction with each other and function together. Further, since the chance of fires starting in two separate areas of the building is quite remote, such an assumption is safe and rational.

It must be appreciated therefore that the smoke screen is an essential component for the two areas in regards to controlling the movement of smoke, the Agent indicated. Protecting the screen thus is vital to maintaining the integrity of the separation. Due to the fact that the smoke separation is a former exterior wall, it will perform well as a screen, he added. These walls have the capability of preventing the migration of smoke between the atrium and adjacent floor areas until the heat from the fire is intense enough to break them. This is more likely to happen if a fire originates immediately adjacent to the glazing, he noted. It is for this reason that the curtain wall is to be protected with close-spaced sprinklers installed beneath a 300 mm wide baffle located around the perimeter of the atrium area.

With respect to the existing floor areas, the Agent stated that in this case they are again faced with an situation where extensive and disruptive modifications are needed to bring about the changes required to meet either of the types of Code compliant smoke control systems. The existing air handling system, he noted, does not have the capacity to perform to the level required for smoke management in an interconnected floor space. The existing curtain walls, however, will protect these areas. Indeed, these walls, as a physical barrier between the spaces, represents an excellent passive safety system. And passive systems, the Agent argued, are always superior to active, or mechanical, ones. The Agent reiterated that the smoke screen will be sprinkler protected. In addition, he noted that the existing floor areas are safe since they enjoy complete protection offered by sprinkler, fire alarm and standpipe and hose systems as per Code.

Lastly, the Agent noted that he has been involved with projects in which NFPA 92B has been employed in other large buildings elsewhere in the province and in the country such as the Air Canada Centre in Toronto, the Corel Centre in Ottawa and GM Place in Vancouver. In his view, NFPA 92B is appropriate for the JDS Uniphase building. And added to the safety brought to the building by the NFPA 92B smoke management system is the safety factor of the curtain wall smoke separation, which is a passive safety feature. These systems, together with the other Code complying safety features, led the Agent to conclude that the objectives of the OBC for areas within an interconnected floor space have been met with their overall approach to fire safety within the structure.

6. Respondent's Position

The Respondent commenced their presentation with some of their own background of the project. They noted that the entire project was presented to municipal officials prior to development of the site and construction of any of the phases, therefore, they see no reason why the Applicants and their Agents did not foresee the two issues at hand.

On the matter of travel distance, the Respondent submitted that they tried to see this as an equivalency issue, but they came to the conclusion that it is not. In their view, it is a sufficiency of compliance issue because the proposal does not comply with the prescriptive requirements of the Code. As he stated, the travel distances, now that they are to be contained within an interconnected floor space, are deficient. Whereas he acknowledged that the Group D areas are only somewhat deficient, the F2 areas, at 50 % over the allowable distance, are a long way from meeting the Code. The Respondent also indicated that he disputed the floor area percentages the Agent outlined. He argued that the F3 occupancy, where the deficiency is greater, has the larger floor area.

In terms of the smoke management issue, the Respondent made the following statement:

"The Nepean Building Division has reviewed the Report to attempt to establish an equivalency as permitted under Section 2.7.2.2. of the Code for systems. Although NFPA 92B is not a referenced document under 2.6 of the Code it can be considered to have some validity in the prediction of smoke production and design of smoke management in atria. Although the use of NFPA 92B may be considered as the basis for an equivalency to the prescriptive requirements for smoke control found in 3.2.8.9. of the Ontario Building Code (for the atrium), it does not provide an equivalency for the required 2 hour vertical fire separation for the existing complex. Clearly, the additional mitigating measures proposed to further protect the smoke separation (existing exterior wall) ie. closed space sprinklers & heat baffles, used to limit smoke movement must be considered as an application for sufficiency of compliance and outside the regulatory framework provided under the Ontario Building Code."

In other words, while they felt they could offer qualified support for the proposal to install an NFPA 92B compliant smoke control system as an alternative solution in the atrium area, they felt that the proposed measures intended to address the issue of upgrading the smoke management system in the existing areas was a concept they felt they had no authority over.

7. Commission Ruling

It is the decision of the Building Code Commission that at the JDS Uniphase building, 3000 Merivale Road, Nepean, Ontario:

a. Sufficiency of compliance with Sentence 3.2.8.4.(4) of the OBC is provided with respect to the proposed 45 m travel distance in the office occupancy areas; however,
b. Sufficiency of compliance with Sentence 3.2.8.4.(4) is not provided regarding the proposed 45 m travel distance in the manufacturing occupancy areas.

It is also the decision of the Building Code Commission that at the JDS Uniphase building, 3000 Merivale Road, Nepean, Ontario, the proposed smoke management system designed in conformance with NFPA 92B, "Guide to Smoke Management in Malls, Atria and Large Areas", and intended for the proposed atrium to be constructed adjoining to the existing building, provides sufficiency of compliance with Article 3.2.8.9. of the OBC.

8. Reasons

Re: Proposed Travel Distances in the Group D Office Occupancy Areas

i. The travel distance proposed for the Group D areas, at 45 m, is only slightly over the required travel distance of 40 m.

ii. The smoke separation provided by the existing (formerly exterior) curtain walls that are to face the atrium, the smoke exhaust system proposed for the atrium and the closely-spaced sprinklers around the atrium perimeter are adequate to mitigate the excess travel distance proposed.

Re: Proposed Travel Distances in the Group F3 Manufacturing Occupancy Areas

iii. The travel distance proposed for the Group F3 areas, at 45 m, exceed the Code requirement of 30 m by 50 % and the proposed compensating measures (described in reason ii above) were not considered commensurate with such an increase of permitted egress distance.

Re: Proposed Smoke Management System

iv. In the present circumstance, the utilization of a smoke management system designed on NFPA 92B is an acceptable alternative to the prescriptive requirements of OBC Article 3.2.8.9.

v. The NFPA - 92B standard is based on sound engineering practices and its requirements have been satisfied in the Applicant's proposal.

Dated at Toronto this 18 th day in the month of May in the year 2000 for application number 2000-32.

BCC Ruling No. 00-21-753

BUILDING CODE COMMISSION DECISION ON B.C.C. #00-21-753

IN THE MATTER OF Subsection 24(1) of the *Building Code Act, 1992*.

AND IN THE MATTER OF Subsection 3.2.3. of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99, 597/99 and 205/00 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Chris Boyd, Rebanks Architects Inc., Toronto, Ontario for the resolution of a dispute with Mr. Terry Willing, Chief Building Official, City of Kingston, to determine whether the new supermarket, proposed to be constructed adjoining to an existing retail mall as one enlarged building built on two properties complies with Sentences 3.2.3.1.(8), 3.2.3.7.(4), 3.2.3.12.(1), 3.2.3.12.(3), 3.2.3.13.(3) and 3.3.1.4.(4) of the Ontario Building Code at the Loblaws Supermarket, 1100 Princess Street, Kingston, Ontario.

City of Kingston
Designate for the Respondent

RULING

1. **The Applicant**

   Mr. Chris Boyd, Rebanks Architects Inc., Toronto, Ontario, has applied for a building permit under the *Building Code Act, 1992* to construct a Loblaws Supermarket, at 1100 Princess Street, Kingston, Ontario.

2. **Description of Constrution**

   The Applicant is proposing to construct a new addition to the north of an existing mall to serve as a Loblaws supermarket. The addition is described as a two storey, noncombustible structure with a building area of 7,432 m^2, that is classified as having a Group E - (retail) mercantile major occupancy. The building is to be equipped with a sprinkler system and a fire alarm system, but not a standpipe and hose system.

   The existing mall is 23,180 m^2 in building area excluding the Sears store, which is to be demolished and will be replaced by the proposed Loblaws facility. The mall is also two stories in building height and is of non-combustible construction. It too is equipped with sprinkler and fire alarm systems, but not a standpipe and hose.

Apart from the standard supermarket food shelves, grocery isles, check out counters, shipping, storage and receiving areas, the ground floor will also contain a pharmacy, a bakery, a photolab/shop and other commercial retail space. The second storey of the supermarket is proposed as an L-shape mezzanine along the north and east perimeter walls of the building. This level will provide space for employee facilities and administrative offices as well as a cooking classroom, a restaurant and a fitness centre. No connection is proposed between this storey and the existing mall.

The supermarket will be provided with two public entrances directly from the exterior on the east wall. Immediately inside the entrance at the south-east corner will be the connection to the mall. This connection is to be comprised of a short north-south corridor that will terminate at a longer existing east-west covered pedestrian corridor that is to separate the two buildings. This latter corridor, which is to be rebuilt as part of the construction, is 6 m in width and has exit doors at both its east and west ends to serve the existing mall's main central corridor. At present, the east-west covered corridor straddles the property line between the two buildings (extending 1.8 m onto the Loblaws' land). The entire south exposing building face of the Loblaws store, a portion of which will form the north wall of the subject corridor, is to be constructed as an unrated fire separation.

To accommodate more parking directly in front of the Loblaws store, the Applicant is proposing to shift the entire supermarket considerably to the west of the former footprint of the Sears store. The placement of the supermarket at this location means that the internal corridor connections between the two buildings will be offset. It also means that the exterior walls of the opposing buildings will be offset, specifically the easterly portion of the mall's north wall and the westerly portion of the supermarket's south wall will be exposed to the dividing property line (4.2 m and 1.8 m away respectively) but not the opposing building.

The construction in dispute involves the proposal to build the supermarket's southern exposing building face as an unrated separation 1.8 m from a property line, a portion of which is to form part of an exit corridor. The Applicant is proposing to include spatial separation agreements registered on title as per OBC Sentence 3.2.3.1.(8) to require if either party were to sell their property that measures be taken to meet the spatial separation requirements.

3. **Dispute**

The dispute between the Applicant and the Respondent is whether the new supermarket proposed to be constructed adjoining to an existing retail mall as one enlarged building built on two properties complies with Sentences 3.2.3.1(8), 3.2.3.7.(4), 3.2.3.12.(1), 3.2.3.12.(3), 3.2.3.13.(3) and 3.3.1.4.(4) of the Ontario Building Code. Subsection 3.2.3. (including the first five Sentences above) governs structural and design requirements for spatial separation and exposure protection of separate buildings located on different properties, separate buildings located on different properties but with zero distance between them (i.e., attached buildings), and buildings connected by (a) walkway(s). Sentence 3.3.1.4.(4) permits, with certain exceptions that are not applicable in this instance, a public corridor to be constructed without fire separations if the floor area is sprinklered and the corridor is more than 5 m in width.

The more fundamental issue that must be addressed prior to any discussion of compliance with the aforementioned Code provisions, however, is whether the proposed expanded, fully sprinklered structure located over two properties should be considered as one building. If the answer to this question is affirmative then Sentences 3.2.3.1.(8), 3.2.3.7.(4) and 3.2.3.13.(3) are no longer applicable since they deal with spatial separation and limiting distance issues from separate buildings. Moreover, if the complex is viewed as one building in conjunction with the fact that the proposed addition will be fully sprinklered (as is the existing building), the covered pedestrian corridor exceeds 5 m in width, and the structure does not contain Group B or C occupancies, then Sentence 3.3.1.4.(4) would be satisfied and also not in dispute. As one building, the only requirements referred to above that would be germane are those relating to the protection of exit facilities found in Sentences 3.2.3.12.(1) and (3).

Put simply, the issues before the Commission are whether the subject structure with the addition of an adjoining supermarket on the adjacent property can be considered for the purposes of Ontario Building Code conformance as one building and whether the proposed design complies with, or in fact is required to comply with, OBC Sentences 3.2.3.1.(8), 3.2.3.7.(4), 3.2.3.12.(1), 3.2.3.12.(3), 3.2.3.13.(3) and 3.3.1.4.(4).

4. **Provision of the Building Code**

Sentence 3.2.3.1. - Limiting Distance and Area of Unprotected Openings

(8) The required limiting distance for an exposing building face is permitted to be measured to a point beyond the

property line that is not the centre line of a street, lane or public thoroughfare if,

a. the owners of the properties on which the limiting distance is measured and the municipality enter into an agreement in which such owners agree that,
   i. each owner covenants that, for the benefit of land owned by the other covenantors, the owner will not construct a building on his or her property unless the limiting distance for exposing building faces in respect of the proposed construction is measured in accordance with the agreement,
   ii. the covenants contained in the agreement are intended to run with the lands, and the agreement shall be binding on the parties and their respective heirs, executors, administrators, successors and assigns,
   iii. the agreement shall not be amended or deleted from title without the consent of the municipality, and
   iv. they will comply with such other conditions as the municipality considers necessary, including indemnification of the municipality by the other parties, and
b. the agreement referred to in Clause (a) is registered against the title of the properties to which it applies.

Sentence 3.2.3.7. - Construction of Exposing Building Face

(4) Except as permitted by Article 3.2.3.9., if a limiting distance shown in Table 3.2.3.1.B. or Table 3.2.3.1.D. for a

Group E, or Group F, Division 1 or 2 occupancy classification permits an exposing building face to have

unprotected openings not more than 10% of the exposing building face, the exposing building face shall be:

c. of non-combustible construction having a fire-resistance rating not less than 2 h, and
d. clad with noncombustible cladding.

Sentence 3.2.3.12 - Protection of Exit Facilities.

5. Except as required by Sentence (3) and as permitted by Sentence 3.4.4.3.(1), if the plane of an exterior wall of an exit enclosure forms an angle less than 135 with the plane of an exterior wall of the building it serves, and an opening in the exterior wall of the exit

enclosure could be exposed to fire from an opening in the exterior wall of the exit or the exterior wall of the building shall be protected in conformance with the requirements of Sentence (4) where the opening in the exterior wall of the building is within 3 m (9 ft 10 in) horizontally and;

a. less than 10 m (32 ft 10 in) below an opening in the exterior wall of the exit, or;
b. less than 2 m (6 ft 7 in) above an opening in the exterior wall of the exit.

(See A-3.2.3.13.(1) in Appendix A).

6. ,

7. Except as permitted by Sentence 3.4.4.3.(1), if an exterior exit door in one fire compartment is within 3 m (9 ft 10 in) horizontally of an opening in another fire compartment and the exterior walls of these fire compartments intersect at an exterior angle of less than 135 , the opening shall be protected in conformance with the requirements of Sentence (4).

Sentences 3.2.3.13. - Wall Exposed to Another Wall

(3) Sentence (1) does not apply to unprotected openings of the fire compartments within a building that is

sprinklered, but shall apply to:

8. unprotected openings of fire compartments on opposite sides of a firewall, and;
9. exposure from unprotected openings of a fire compartment that is not protected by an automatic sprinkler system.

Sentences 3.3.1.4. - Public Corridor Separations

(4) If a floor area is sprinklered, no fire separation is required between a public corridor and the remainder of the

floor area provided the public corridor;

10. is more than 5 m (16 ft 5 in) in unobstructed width, and;
11. does not serve:

. a care or detention occupancy, or;
i. a residential occupancy.

5. **Applicant's Position**

The Agent for the Applicant submitted that the mall and the Loblaws store, although on separate properties, should be considered as a single building for the purposes of Building Code compliance. To support the argument that the complex should be seen as one building he indicated that an interconnected electronically supervised sprinkler system will protect the entire structure. Further, a maintenance agreement and a spatial separation agreement as per Sentence 3.2.3.1.(8), although the latter is not required, would be concluded covering the two properties and registered on title, thereby ensuring that the mall and supermarket function as a single complex. (The purpose of the spatial separation agreement, he noted, "was to ensure that if either parties were to sell their respective lands, no changes to the buildings would occur unless measures were taken to meet the OBC spatial separation requirements.")

As a result, he argued that, as one building, the requirements of Sentences 3.2.3.1.(8), 3.2.3.7.(4) and 3.2.3.13.(3) are not applicable since they relate to the separation and protection of separate buildings. Moreover, if viewed as one building, Sentence 3.3.1.4.(4) is not an issue since the conditions of that provision are met; the complex will be fully sprinklered, the corridor is to be wider than 5 m, and there will be no Group B or C occupancies. Consequently, the Agent added, that the covered public corridor is not required to be constructed with fire separations.

The Agent continued by arguing that the Code does not require a firewall or a fire separation to be built on a property line. The OBC, he asserted, has certain requirements for both firewalls and fire separations if one is mandated, but no where in the Building Code does it stipulate that these must be built on property lines. The Agent noted that the BCC upheld this position in a recent decision (#99-60-716) in which it ruled that a firewall was not required on a lot line where a single building straddled two properties.

In conclusion, the Agent reiterated that the proposed design of the Loblaws addition to the existing mall conforms to the provisions of the Building Code that, as a single entity, are applicable. He also noted that the design will ensure that the exit facilities are protected as per Sentences 3.2.3.12.(1) and (3).

6. **Respondent's Position**

The Respondent began by submitting that he had no problem with the concept of a single building extending over a property line without a firewall between them. He stated that his concern with the design of the subject structure is that the mall (including corridor) and the supermarket should be compartmentalized from each other. Specifically, he argued that in accordance with Sentence 3.2.3.7.(4) of the OBC the south wall of the proposed supermarket, at 1.8 m from the lot line, is required to be built with a fire separation having a two hour resistance rating and must have non-combustible cladding.

The Respondent indicated that he was also concerned about exiting from the covered pedestrian corridor. He noted that a large portion of the subject wall assembly will be immediately adjacent to the exit from west end of the public corridor in the mall. The U-shaped configuration formed by the mall to the south, the recessed exit doors from the corridor and the substantial projection of the Loblaws south exposing wall to the west makes it necessary to travel in close proximity to the disputed wall assembly. In the event of a fire within the Loblaws supermarket, he argued that travelling next to this unrated wall may present a hazardous situation. He felt that this could result in the exit becoming unuseable during an emergency which would obviously present a serious life safety concern.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the new supermarket proposed to be constructed adjoining to an existing retail mall as one enlarged building built on two properties need not comply with Sentences 3.2.3.1.(8), 3.2.3.7.(4) and 3.2.3.13.(3) of the Ontario Building Code at the Loblaws Supermarket, 1100 Princess Street, Kingston, Ontario.

It is also the decision of the Building Code Commission that the proposed construction for the covered pedestrian corridor complies with Sentence 3.3.1.4.(4) of the OBC. However, the concerns dealing with Sentences 3.2.3.12.(1) and (3) must be addressed in the design of the building.

8. **Reasons**

i) It is the position of the commission that this complex can be considered as one building.

RULING

1. The Applicant

Mr. Ray Abbott, Co-Owner, NRG Fitness Centre Inc., Oshawa, Ontario, has received a building permit under the Building Code Act, 1992 and has recently constructed a new fitness facility known as NRG Fitness Centre Inc., at 69 Taunton Road West, Oshawa, Ontario.

2. Description of Construction

The Applicant has recently constructed a new fitness complex called "NRG Fitness Centre" classified as having Group A, Division 2 major occupancy. The structure is described as one storey in building height, 1313.86 m2 in building area, and of non-combustible construction.

On the eastern portion of the main floor, the building consists of a gymnasium divided into a weight room (16 m by 8 m), a resistance training area (16 m by 16 m) in the middle, and an aerobic room (12 m by 15 m). Also on this side of the building are areas such as the locker rooms, showers, laundry facilities, etc. that are ancillary to the gymnasium. On the building's west side and immediately adjacent to the central main entrance of the building (on the south side) is a nursery followed by a laundry room,

both of which open to an entrance lounge. This lounge contains the reception counter which acts as a partial border on the north side to allow for controlled entrance to the corridor leading to the gymnasium and its ancillary areas.

The building has a second level that is considered a mezzanine and which covers the areas above the weight room, entrance lounge and the corridor. The mezzanine accommodates some of the exercise equipment. The stairs leading to this level are located within the resistance training area.

The building is operated under a lease agreement and prohibits unsupervised use of the equipment by youths under the age of 15.

The issue at dispute between the Applicant and Respondent is whether the operation of the building compensates for the as-built guards constructed mainly with panels consisting of 50 by 50 mm wire mesh and thereby provides sufficiency of compliance with Sentences 3.3.1.17.(5) and 3.4.6.5.(8) of the Ontario Building Code. Both provisions stipulate that unless it can be shown that openings in a guard do not pose a hazard, the guard must be designed so as not to facilitate climbing. Specifically, Sentence 3.3.1.17.(5) mandates safety requirements within floor areas and Sentence 3.4.6.5.(8) mandates safety requirements related to exit signs. The guards in dispute are located both within a floor area and in exits.

3. Dispute

Both parties to this dispute apparently agree that the design of the guards could facilitate climbing. The dispute, however, is whether in this instance, with supervised utilization of equipment for youths under 15, the guards constitute a hazard. Therefore the issue before the Building Code Commission is whether the intended supervised use of the facility compensates for the inherent climability of the guards.

4. Provisions of the Ontario Building Code

Sentence 3.3.1.17. Guards

(5) Unless it can be shown that the location and size of openings do not present a hazard, a guard shall be designed so that no member, attachment or opening located between 140 mm (5 ? in) and 900 mm (2 ft 11 in) above the level protected by the guard will facilitate climbing.

Sentence 3.4.6.5. Guards

(8) Unless it can be shown that the location and size of openings do not present a hazard, a guard shall be designed so that no member, attachment or opening located between 140 mm (5 ? in) and 900 mm (2 ft 11 in) above the level being protected by the guard will facilitate climbing.

5. Applicant's Position

At the outset, the Applicant submitted that the design and locations of the as-built guards do not pose a hazard as the gym is restricted to persons 15 years or older. In addition, no persons of diminished capacity are permitted. The Applicant also noted that the gym is a controlled space where a member card must be scanned to gain full access.

The Applicant stated that the design of the guards was based on his suggestion after seeing the same design in some YMCA complexes. He continued that although they were warned by the city at the construction stage about the climability of the guards they had to proceed with construction in order to be prepared for their January opening.

The Applicant argued that their supervised operation of the centre would compensate for the climbability of guards for the following reasons: the open-concept structure is not a large building and

the mezzanine area is visible from every point on the ground floor; youths under 15 years cannot use the equipment without one-on-one adult supervision; the nursery is located by the front door to the building away from the controlled access gymnasium and ancilliary areas; children are not allowed to enter the controlled access areas; there are always at least two employees at the reception counter to supervise who enters; tours for prospective members are supervised; and one hour orientation sessions are offered to every new member to the centre.

The Applicant also argued that they have stability as a tenant in the building. He indicated that they have a 15 year lease with the intention to possibly purchase thereafter.

In closing, the Applicant stated that although he is aware that the decisions of the Commission are all site specific, he believes they provide the same level of security and supervision in their complex as is the case in the Durham YMCA building, which recently had identical guards approved by the Building Code Commission.

6. Respondent's Position

The Respondent submitted that even though NRG Fitness members under 15 require supervision, this stipulation does not restrict children of lower ages from joining and attending the club.

The Respondent mentioned that they had advised the Applicant about the climability of the guards at the design stage. It was also suggested that vertical pickets could be provided in lieu of the wire mesh and would thereby avoid the climbability issue. Moreover, the Respondent felt that the proper process in terms of submitting all the building plans was not fully followed.

In terms of the as-constructed guards, the Respondent argued that the 50 by 50 mm welded wire mesh would provide a foothold that could facilitate climbing by children and this, in his opinion, contravenes Sentences 3.3.1.17.(5) and 3.4.6.5.(8) of the OBC. In addition, there was concern raised regarding the

future use or extension of the building that could include some facilities to be used by children, which could pose serious hazards. The Respondent noted that if a future owner decided to use the building as a childcare centre, the guards would be very dangerous as children are not supervised on a one-on-one basis in such facilities. Such a change in tenancy is a possibility, as the Applicant is only leasing the building.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-built guards constructed mainly with panels consisting of 50 by 50 mm wire mesh do not provide sufficiency of compliance with Sentences 3.3.1.17.(5) and 3.4.6.5.(8) of the Ontario Building Code at NRG Fitness Centre Inc., 69 Taunton Road West, Oshawa, Ontario.

8. Reasons

i. The guards are climbable.
ii. The guards are climbable. The security arrangements do not appear to be adequate so as to ensure that only eligible persons will be allowed in the areas containing the subject guards.
iii. The guards are climbable. The BCC is concerned that since the building is leased a future tenant may propose a use that could expose children to the guards thus creating a dangerous situation.

RULING

1. **The Applicant**

   Mr. Karl Stevens, Stevens Burgess Architects Ltd., Toronto, Ontario, has applied for a building permit under the *Building Code Act, 1992*, to construct a school facility known as Ajax Secondary School at 1375 Harwood Avenue North, Ajax, Ontario.

2. **Description of Constrution**

The Applicant is proposing to construct a multi-purpose school building classified as Group A, Division 2 occupancy to serve as a secondary school for both the Durham Catholic District School Board and the Durham District School Board. The proposed building is described as 20,378 m^2 in building area, three stories in building height and will be built (according to OBC Article 3.2.2.24.) of non-combustible, 1 hour rated construction. The building will be equipped with a full sprinkler system and a fire alarm system, but not a standpipe and hose system.

The proposed building will consist of a central portion flanked by north and south wings. The central area is proposed to accommodate shared facilities such as a 200 seat food court, libraries, and an auditorium. The north and south wings are nearly identical and will each house a secondary school, complete with classrooms, gymnasia and administrative facilities. The north wing will be allocated to the Durham District School Board and the south to the Durham Catholic District School Board.

A central, two storey corridor, described as a pedestrian "street" running throughout both school wings, is to act as the spine of the entire building. The branches of this "street"/ corridor will connect to the food court, which is to be located in the middle portion of the shared facilities area. As well, the "street" serves to separate the three storey classroom areas on the west from the one storey gymnasia and communication/construction/technical design studios on the east.

The two storey street will also create an interconnected floor space between the first and second floors. Since the portions of both schools to the east of this corridor are one storey, the east wall of the upper (or second storey) level of the pedestrian street becomes an exterior wall of the building. The west wall of the corridor at this level, however, forms the rear partition wall of a row of classrooms on the second floor of both schools. This wall is comprised mostly of large glazed areas and is considered an unrated separation. The second floor classrooms overlooking the pedestrian street form part of the interconnected floor area with the first floor. The opposite wall in these rooms will separate the remainder of the second floor with a 30 minute rated separation, including 20 minute rated doors which will not be equipped with closing devices.

The three storey classroom areas of both wings have been designed in an L-shape, with the long portion running parallel to (and west of) the street. Classrooms are to be located on either side of north-south and east-west public corridors. In the Public Board's secondary school the north-south and east-west corridors measure 76 and 37 m in length respectively. On the third floor of this school these corridors are 78 m and 37 m. The Separate School Board's wing is slightly smaller, with the north-south and east-west corridors measuring 72 and 30 m respectively on the

second floor and 74 m and 30 m on the third floor. (The east wall of the north-south, or longer, corridors on the second floor are to be provided with the above mentioned 30 minute separation, including the 20 minute rated doors equipped with closing devices.)

The classroom areas of both schools are to be served by three exit stairs, one each at either end of the north-south and east-west corridors and one at the point where the corridors intersect. On the second floor of the public secondary school the travel distance from the mid-point of the north-south corridor (excluding classrooms) to the exit stair is 38 m. The travel distance for the east-west corridor on this floor is 37 m. On the third floor of this school the same dimensions are measured at 39 and 37 m. Likewise for the separate secondary school, the second and third floor (corridor only) travel distances are 36 and 30 m and 37 and 30 m respectively.

The shared facilities area, to be located in the centre of the building, will be separated from the two adjoining schools by a 1 hour rated wall. However, where the pedestrian street from both schools joins the food court area, the separations, each comprised of four doors with sidelight panels, are proposed to be unrated. The Applicant intends to install close-spaced sprinklers on both sides of these unrated separations.

An auditorium, designed for use by the schools as well as the surrounding community, is to be situated in the western portion of the shared facilities area adjacent to the food court. At the stagehouse area of this auditorium, a mechanical exhaust system is proposed for venting purposes that will provide six air changes per hour. The system will be designed so that it is connected to the building's emergency power system and activates automatically on sprinkler water flow.

The construction in dispute involves the interconnection of the first and second storeys, specifically the unrated separation at the second storey level of the pedestrian street, the travel distances on the second and third floors of both schools, the use of unrated separations and close-spaced sprinklers in lieu of a 1 hour separation in the pedestrian street between the schools and the food court and the use of mechanical smoke exhaust for the stage area in lieu of roof vents.

3. **Dispute**

There are five issues in dispute between the Applicant and Respondent. The first and third issues are matters of interpretation of the Ontario Building Code (OBC), the remaining disputes involve sufficiency of compliance with certain provisions of the OBC.

The first question, a matter of interpretation, is whether the proposed second storey classroom partitions, as unrated separations overlooking the two storey pedestrian corridor, comply with the restrictions for interconnected floor spaces found in Sentence 3.2.8.1.(5) of the Ontario Building Code (OBC). This provision, specifically Clause 3.2.8.1.(5)(c), requires that the upper floor area of an interconnected floor space terminate at a vertical floor-to-ceiling fire separation. Clause (d) permits this vertical separation to be unrated. Clause (e), however, is an exception to Clause (d). It states that where a corridor is located "immediately adjacent" to the subject vertical fire separation, a minimum 30 minute rating is required.

As noted, the second storey classroom partition walls along the upper level of the west side of the pedestrian street are to be unrated separations. It is the opposite walls in these rooms that will have a 30 minute fire-resistance rating. At issue is whether the classrooms, albeit on the second floor, should be considered as being "immediately adjacent" to the two storey high pedestrian street corridor. If found to be the case, a 30 minute rating would be required in the separation overlooking the pedestrian street.

The second issue is whether the travel distances in the second and third floor corridors provide sufficiency of compliance with Clause 3.4.2.5.(1)(c) and Sentence 3.3.2.5.(4) of the OBC. Clause 3.4.2.5.(1)(c) requires that the subject building have maximum travel distance of no more than 45 m. The proposed travel distance in a total of 12 classrooms in both schools (all situated in the central portion of the of the north-south corridors) will exceed 45 m when measured into the most remote part of these rooms. In the worst case, the excess distance is 4.6 m for a total travel distance of 49.6 m.

The latter provision, Sentence 3.3.2.5.(4), permits the one hour fire-resistance rating required in the corridor walls of such buildings (as per Sentence 3.3.2.5.(1)) to be waived if the maximum travel distance standard (of 45 m) is met. As described above, only the east wall of the north-south corridor on the second floor will be constructed with a fire-resistance rating, proposed as a 30 minute separation. Therefore, all four corridors (north-south second and third floor corridors in both schools) that are proposed to have travel distances exceeding 45 m must be considered as having unrated separations.

At issue then, is whether the excess travel distance sufficiently complies with the 45 m requirement. If deemed so, the fire separations required in the corridors by Article 3.3.2.5. may be waived.

The third issue is also an interpretive question. It is whether the two schools proposed for the structure are considered as separate suites and therefore must conform to the separation requirements found in Sentence 3.3.1.1.(1) of the OBC. This provision requires, except under certain circumstances not applicable to the present situation, that differing suites in a building must be separated from adjoining ones by a one hour fire separation. However, if the schools, due to their similar nature and proposed joint use of many facilities, can be viewed as a single suite then the separation requirements of 3.3.2.2.(8) would be applicable. This Sentence stipulates that, in a sprinklered elementary or secondary school, a room or an area of complementary use with an occupant load of more than 200 must provide a 30 minute rated separation from the rest of the school. Put simply, the question before the Commission therefore is whether the proposed Ajax school building will contain one or two schools. The answer will dictate the appropriate construction requirements.

Depending on the outcome of the above question is the related issue of whether the proposed close-spaced sprinklers on both sides of the unrated fire separations at the connection points between the pedestrian street and the food court provides sufficiency of compliance with Sentence 3.3.1.1.(1) or Sentence 3.3.2.2.(8) of the OBC. Regardless of whether the separation is required to be one hour or 30 minutes, a certain rating is necessary, and as a fire separation it must be continuous. The unrated separation, however, proposed by the Applicant for the doors and sidelight panels at the access points between the street and the food court interrupts the one hour separation to be built between the schools and the shared facilities area. To compensate for this penetration of the fire separation, the Applicant is offering to provide close-spaced sprinklers on both sides of each access point. The issue before the Commission then is whether this is adequate compensation for the required (one hour or 30 minute) rated separation.

The fifth dispute is whether the proposed installation of a sprinkler-activated mechanical exhaust system in lieu of roof mounted gravity vents in the stagehouse area of the theatre provides sufficiency of compliance with Sentence 3.3.2.12.(5) of the OBC. This last provision stipulates that stages designed for theatrical performances must be equipped with at least two roof vents of certain aggregate area and which open automatically when the sprinkler system activates. The proposed system does not rely on gravity venting nor is it sized on the prescribed 1/8 ratio of the

stage area. Again, at issue is whether the proposed mechanical system provides adequate compensation for the venting required by Code.

4. **Provision of the Building Code**

Sentence 3.2.8.1.(5) - Mezzanines & Openings through Floor Assemblies

(5) An interconnected floor space is permitted in an elementary or secondary school provided;

a. the interconnected floor space consists of the first storey, and the storey next above or below it, but not both,
b. the interconnected floor space is sprinklered,
c. the portions of the upper floor area that do not terminate at an exterior wall, a firewall or a vertical shaft shall terminate at a vertical fire separation extending from the floor assembly to the underside of the floor or roof assembly above,
d. except as provided in Clause (e), the fire separation required in Clause (c) need not have a fire-resistance rating,
e. where a corridor is located immediately adjacent to the fire separation required in Clause (c), the fire separation shall have a fire-resistance rating of not less than 30 min, and
f. where a portion of a floor area is not within the interconnected floor space, the required access to exit from this portion of the floor area shall not lead through the interconnected floor space.

Clause 3.4.2.5.(1)(c) - Location of Exits

(1) Except as permitted by Sentences (2), (3) and 3.3.2.4.(6), if more than one exit is required from a floor area, the exits shall be located so that the travel distance to at least one exit shall be not more than; (c) 45 m (147 ft 8 in) in a floor area that contains an occupancy other than a high hazard industrial occupancy, provided it is sprinklered.

Sentence 3.3.2.5.(4) - Corridors

(4) The fire separation required by Sentence (1) is permitted to be waived if the distance from any point in the floor area to an exit measured along the path of travel to an exit does not exceed the travel distance permitted by Article 3.4.2.5.

Sentence 3.3.1.1.(1) - Separation of Suites

(1) Except as permitted by Sentences (2) and (3), each suite in other than business and personal services occupancies shall be separated from adjoining suites by a fire separation having a fire-resistance rating not less than 1 h.

Sentence 3.3.2.2.(8) - Fire Separations

(8) Except as required in Sentence (9), in an elementary or secondary school, where the occupant load of a room exceeds 200 persons, the room and ancillary rooms of a complimentary use shall be separated from the remainder of the building by a fire separation having a fire-resistance rating not less than; (a) 1 hour where the building is not sprinklered, or
(b) 30 minutes where the building is sprinklered.

Sentence 3.3.2.12.(5) - Stages for Theatrical Performances

(5) At least 2 vents for the purpose of venting fire and smoke to the outside of a building shall be provided above a stage designed for theatrical performances and shall; (a) have an aggregate area not less than one eighth of the area of the stage behind the proscenium opening, and
(b) be arranged to open automatically upon actuation of the sprinkler system.

5. **Applicant's Position**

At the request of the Commission, the Agent for the Applicant began his presentation on the subject school with the issue of the proposed travel distance and its sufficiency of compliance with the OBC.

However, prior to arguing sufficiency of compliance with Sentences 3.4.2.5.(1) and 3.3.2.5.(4), the Agent offered the interpretive argument that Sentence 3.1.8.11.(3) is significant in terms of dictating the subject building's travel distance. This provision can be read, he argued, as permitting the measurement of the required 45 m travel distance from a classroom door because it waives the requirement for a closing device. As he explained, by not mandating closing devices on the doors, the Code allows the continuousness of the corridor separations to be interrupted. By allowing this, the separations therefore cannot be employed in the usual manner as a method to extend the travel distance beyond 45 m and into classrooms.

Conversely, if the Code intended that the entire floor area must have a travel distance of less than 45 m, then this provision would be irrelevant. As a result, it would seem inconsistent with Sentence 3.1.8.11.(3) to measure the travel distance into the remotest area of the room. The classroom door, he asserted, is the logical starting point of measurement. And since the distance to the classroom doors in all cases is less than 45 m, the Agent indicated that the proposed design will comply with Sentence 3.1.8.11.(3).

Notwithstanding the above, in terms of sufficiency of compliance, the Agent submitted that the travel distances, which only slightly exceed the 45 m requirement, do not reduce the life safety of the occupants. As he noted, in the worst cases the travel distance is 49.6 m and only a very small portion of the total floor area of the building exceeds the prescribed limit. Moreover, much of the floor areas that are beyond the 45 m distance are located at the perimeters of rooms and in corners. He argued that these are very likely places for putting large furniture or millwork, meaning that the number of occupants that would actually be affected would be minimal. The added time to travel the extra 4.6 m, at 4 to 5 seconds, is not significant, he added.

Indeed, the Agent argued that the extra distance would not affect the time required to evacuate the floor area because, as he stated, "the time required to safely exit a floor area is practically governed by the access time (to get) into exit stairs, and not the time of travel to the stairs". He supported this position by referring to a stair exit analysis he conducted based on NFPA 101A, "Guide on Alternative Approaches to Life Safety". The conclusion of this research, he indicated, was that the "time required to walk to an exit (2.24 minutes), including the additional time associated with a travel distance greater than 45 m, will still be less than the time required to leave the floor area by entering an exit stair (2.72 - 2.91 minutes), (sic) complying with Building Code capacity requirements. Reducing travel distance to 45 m will not reduce the time required for the occupants to leave a floor area." In other words, the length of time to wait in the queue to enter the door to the exit stair will surpass the time required to travel from anywhere on the floor area to the exit stairs.

The Agent stated that he was using NFPA 101A as a stand-alone test methodology and not as an alternate standard of conformance. He also noted that although NFPA 101A is a U.S.-based standard, the estimated exit times are compatible with those expected in a building built to Canadian standards.

Based on the above reasons, the Agent argued that the requirement mandated in the Code for fire separated corridors, in particular closing hardware on the classroom doors, can be waived.

Regarding the interconnected floor space and the fire separations at the second storey classrooms, the Agent stated that, in his interpretation of Clause 3.2.8.1.(5)(e), the partition wall overlooking the pedestrian street is permitted to be an unrated separation. He argued that the 30 minute rated wall required in this provision is necessary only when the corridor is located "immediately adjacent" to the separation. The requirement referred to in Clause (e), however, specifically relates to the separation on the upper storey of the interconnected floor space. As a result, the "corridor identified in Clause (e) is therefore interpreted to be a corridor located at the upper storey of the interconnected floor space."

The subject classrooms, he asserted, are therefore only "immediately adjacent" to the north-south public corridor located on the second floor running parallel to the pedestrian street, and the 30 minute separation will be provided in that (the entry side) wall. The pedestrian street, as a corridor for the first floor, cannot be viewed as being "immediately adjacent" to the second storey classrooms and thus the separation may be unrated, as permitted in Clause (d).

The Agent then discussed why the Code requires a 30 minute separation in the interconnected floor space to protect the corridor on the second floor. As he explained, since fire primarily travels upwards it makes sense that the OBC would require the second storey corridor to have additional protection. Conversely occupants on the lower floor would not be exposed to the same level of risk from a fire originating on the upper storey. Moreover, it is the corridors and not the individual rooms that serve the most occupants, and for this reason the separations "immediately adjacent" to the corridors must have a 30 minute fire-resistance rating. This fire protection philosophy, as enunciated in the Code, has been reflected in the design of the building's interconnected floor area and incorporated specifically in the placement of the unrated and 30 minute separations on either side of the second floor classrooms, the Agent noted.

On the interpretive issue of whether the entire school building can be viewed as having one suite, the Agent argued that due to the similar functions of both high schools and their high degree of integration (through the sharing of the library, food court and auditorium), the structure should be considered as having one occupancy. He indicated that the Technical Background Information memo produced by the staff of the Ministry's Housing Development and Buildings Branch supported this position. In fact, he referred to the Branch's presentation which likened the school building to a government office that often has different ministries and departments in the same building.

Based on this interpretation, the Agent argued that Sentence 3.3.2.2.(8) and not 3.3.1.1.(1) is the applicable Code requirement. Sentence 3.3.2.2.(8), he noted, only requires a 30 minute separation between the food court and the schools on either side. Currently, however, a one hour separation is proposed, which has been agreed to by the Applicant and Respondent. Nevertheless, the Agent indicated that it is the 30 minute rating stipulated in Sentence 3.3.2.2.(8) with which he will argue sufficiency of compliance on the following issue.

In terms of the close-spaced sprinklers then, the Agent noted that the system has been designed in accordance with NFPA 13, 5-3.7 and are proposed for both sides of each access point from the food court into the pedestrian street. He argued that the water curtain created by this system (upon actuation of the full sprinkler system) would provide "an effective means of controlling radiation from a fire." He also noted that, as major pedestrian circulation areas, the access points into the street and the corridor itself would not have a combustible load of any significance. For these reasons, the Agent stated that the close-spaced sprinkler proposal provides sufficiency of compliance with the 30 minute separation required in Sentence 3.3.2.2.(8).

Lastly, on the issue of the stage smoke venting, the Agent asserted that the proposed "sprinkler-activated mechanical exhaust system for the auditorium stage will provide a superior level of safety to stage venting." In other words, he argued that the mechanical venting system will not only provide sufficiency of compliance with Sentence 3.3.2.12.(5), it will surpass the required level of safety. The Agent offered the following reasons as to why the sprinkler-activated mechanical exhaust system is more effective:

"- the purpose of the vents is to assist clearing smoke from the stage house. A mechanically operated exhaust system can be designed to perform the same function.

"- the efficiency of the required gravity vent system is dependent on exterior climate conditions. The efficiency of natural venting is reduced as external temperature decreases. A mechanical exhaust system will exhaust the stagehouse at a consistent rate, regardless of external weather conditions.

"- the opening of gravity vents can be adversely affected by ice and snow, thereby affecting operating efficiency. Mechanical exhaust equipment can be weather protected more readily, reducing the likelihood of failure due to inclement weather.

"- mechanical exhaust equipment will be connected to the building (sic) emergency power supply system.

"- mechanical exhaust equipment will be designed to exhaust the stagehouse at a rate of 6 air changes/hr, comparable to that used for smoke venting in highrise buildings and smoke control in interconnected floor spaces.

"- the system will be designed to activate on sprinkler water flow, identical to the operation required for roof vents."

The Agent also stated that many similar proposals have been approved in jurisdictions across Ontario and North America. In fact, similar applications have come before the Building Code Commission in the past and have been accepted. There is growing acceptance that such mechanical venting systems are more reliable and are preferable as exhaust systems in these installations, he added.

Finally, the Agent argued that mechanical systems are also superior because they are less likely to transmit exterior noise into the building which would adversely affect the use of the auditorium.<

In conclusion, the Agent submitted that the design of the proposed building, including the above discussed issues, provides the same, or better, level of fire and life safety protection as that intended by the Ontario Building Code.

6. **Respondent's Position**

The Respondent began his presentation by noting that the proposed building in dispute, with an occupant load of approximately 3,500, will be the largest high school in the country. As a result, it is very important that the subject Code compliance issues are adequately addressed.

On the issue of travel distance, the Respondent indicated that 45 m was the maximum distance to an exit as per Clause 3.4.2.5.(1)(c), unless the corridors providing access to exit are built with fire separations in accordance Sentence 3.3.2.5.(4). In the latter case, the travel distance need only be measured from the door of the classroom. However, since much of the wall area in these corridors cannot be considered as fire separations because the doors will not be provided with closing hardware, he stated that the travel distance should be measured into the most remote point within the classrooms. (The Respondent did not address the interpretive issue of Sentence 3.1.8.11.(3).) When measuring into the rooms, he noted that a portion of 12 classrooms are

beyond the 45 m limit. As a result, he argued that the fire separations, as set out in Article 3.3.2.5., are required. The Respondent did acknowledge that the additional distances in dispute are relatively minor.

Regarding the separations at the interconnected floor space, the Respondent argued that he views the pedestrian street as a two storey corridor. Therefore, even though the upper level of the street is an open space and cannot be used for exiting, it is still part of a corridor area. Based on this interpretation of the Code, he asserted that the partition walls in the classrooms overlooking the pedestrian street should be considered as being "immediately adjacent" to a corridor and, in accordance with Clause 3.2.8.1.(5)(e), are therefore required to be built as a separation having a 30 minute fire-resistance rating. On this issue also the Respondent did concede that there are other legitimate interpretations of the OBC. He indicated, however, that he felt it prudent to follow the more cautious interpretation.

In so far as the issue of whether the school has one or two suites, and whether it should have a 30 minute or one hour separation around the food court, the Respondent indicated that not enough is known yet about how the school will operate in order to determine if it will function like one or two schools/suites. Again, he rationalized that erring on the side of caution would be the wiser approach. Consequently, he stated that he considers the two schools as separate tenants. In his view, the one hour rated wall as mandated by Sentence 3.3.1.1.(1) is the appropriate standard.

Following the above interpretation, the Respondent argued that the separations at the access points between the food court and pedestrian street, as designed, do not provide a one hour rating, nor even 30 minutes. Moreover, the proposal to install close-spaced sprinklers on both sides of these separations does not, in his mind, provide adequate compensating benefits for the lack of a required separation. The OBC does not specifically recognize the addition of close-spaced sprinklers in lieu of maintaining a fire separation, he added. The Respondent stated that he would feel more comfortable with the proposal if deluge sprinklers were being offered.

Lastly, with respect to stage venting, the Respondent indicated that from a strictly prescriptive point of view Sentence 3.3.2.12.(5) of the Code requires at least two gravity vents to be provided in the stage roof that will open automatically with activation of the sprinkler system. The proposed mechanical ventilation is an alternative system which is also not recognized by the Code. However, he acknowledged that the proposal offers certain advantages over the venting system mandated by the OBC. Nevertheless, he felt he did not have the authority to accept such a system since the Code requirements were clear.

7. **Commission Ruling**

The following are the decisions of the Building Code Commission as they relate to the proposed Ajax Secondary School, at 1375 Harwood Avenue North, Ajax, Ontario.

It is the decision of the Building Code Commission that sufficiency of compliance with Clause 3.4.2.5.(1)(c) and Sentence 3.3.2.5.(4) has been obtained as it relates to the proposed second and third floor travel distances. Moreover, the corridors serving the classrooms need not be fire separated, since the travel distance is accepted. However, the entry side wall of the second storey classrooms, as a separation between interconnected floor space and a public corridor, must be provided with a 30 minute fire-resistance rating. Door closing hardware may be excluded from this separation as per Sentence 3.1.8.11.(3).

It is the decision of the BCC that the partition wall overlooking the interconnected floor space, as designed, need not, according to OBC 3.2.8.1.(5), be separated from the floor opening by a rated fire separation.

It is the decision of the BCC that the proposed Ajax Secondary School will be operated under a single tenancy and, as a result, the suite separation requirement of Sentence 3.3.1.1.(1) does not apply.

However, it is also the decision of the BCC that the unrated partitions with glass doors equipped with close-spaced sprinklers and proposed to be located across the school's main corridor, or pedestrian street, do not provide sufficiency of compliance with Sentence 3.3.2.2.(8).

Lastly, it is the decision of the BCC that sufficiency of compliance with Sentence 3.3.2.12.(5)has been obtained for the proposed venting system to exhaust the stage area.

8. **Reasons**

1. The excess distances, at 4.6 m or less, are small and are located in room corners that are likely to be occupied by furniture.
2. The exit travel distances, slightly in excess of 45 m, do not reduce the level of safety for the occupants as the time required to safely exit a floor area in this instance is governed in practice by the access time to the exit stairs.

3. The proposed design of the interconnected floor space at the second storey classrooms that proposes an unrated separation overlooking the pedestrian street and a 30 minute rated wall opposing, in our interpretation, is in compliance with Sentence 3.2.8.1.(5) of the OBC.
4. Thirty minute fire separations are required by OBC 3.3.2.2.(8) and the proposed partition and glass doors with close-spaced sprinklers do not provide adequate compensatory measures.
5. The mechanical exhaust system is equal or superior to roof mounted gravity vents.

City of Toronto
Designate for the Respondent

RULING

1. The Applicant

Mr. Don Desrocher, Vice-President, 1147771 Ontario Ltd., Toronto, Ontario, has received an order to comply under the Building Code Act, 1992 to remedy certain alleged deficiencies regarding the as-built stairways within four recently constructed residential units at 15, 15a, 17 and 17a, Boulton Avenue, Toronto, Ontario.

2. Description of Construction

The Applicant has recently constructed a Group C - residential townhouse complex consisting of four units. Each unit is two and a half storeys in building height, 139.41 m^2 (1500 ft^2) in building area, and of combustible construction.

The construction in dispute involves the dimensions of landings serving the interior stairs of each unit.

The subject units are referred to as unit 15, 15a, 17, and 17a. There are two landings in each of the four units, one located at the stairs leading from the ground floor to the second floor and the other located at the stairs leading from the second floor to the third floor. Each landing is at the base of the stair run and two risers up from the floor level it serves. The dimensions of the subject landings are as follows:

UNIT	FIRST FLOOR	LANDING SIZE	SECOND FLOOR	LANDING SIZE

	STAIR WIDTH	(W X L)	STAIR WIDTH	(W X L)
15	915 mm (845)	960 mm X 820 mm	915 mm (845)	960 mm x 870 mm
15A	910 mm (828)	920 mm X 810 mm	940 mm (860)	990 mm x 840 mm
17	918 mm (848)	920 mm X 800 mm	915 mm (845)	990 mm x 880 mm
17A	900 mm (840)	920 mm X 800 mm	940 mm (870)	980 mm x 830 mm

According to the Applicant, the clear width of the subject stairs, when measured between the stringers, is less than the overall (wall face to wall face) width. The measurements between the stringers have been provided in the parentheses next to the stair widths.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the as-built landings that are not as long as the width of the stairs which they serve provide sufficiency of compliance with Sentence 9.8.4.1.(1) of the Ontario Building Code.

Sentence 9.8.4.1.(1) governs the dimensions of landings. According to this provision, with two exceptions not applicable here, a landing must be at least as long and as wide as the width of the stairs in which they are located. Neither of the landings in the four units in dispute have a length equal to or greater than the width of the stairs that they serve.

4. Provisions of the Ontario Building Code

Sentence 9.8.4.1.(1) Dimensions of Landings

1. Landings shall be at least as wide and as long as the width of stairs in which they occur, except that
    a. the length of landing for exterior stairs serving not more than 1 dwelling unit need not exceed 900 mm (2 ft 11 in), and
    b. the length of landing for all other stairs in a straight run need not exceed 1,100 mm (3 ft 7 in).

5. Applicant's Position

The Applicant submitted that the landings, as constructed, meet the intent of the Code and do not pose a life or fire safety hazard to the occupants.

At the outset of the hearing it was acknowledged that, under the Ontario Building Code, the width of a stair is the basis for determining the landing size. The Code, however, does not specifically define the term "stair width". The Applicant submitted that "(f)or exiting purposes, the Code specifies how to measure the width. Sentence 9.8.3.3.(1) states '...stairs used by the public shall have a width measured between wall faces or guards, of not less than 900 mm (2 ft 11 in)'. However, Article 9.8.7.6. permits encroachments into this width for handrails and construction below handrails of 100 mm (4 in) on each side. Thus, the effective width of the stair (width of stair tread or clear width between stringers) could be 700 mm". He went on to argue that all of the landings in dispute exceed this measurement.

The Agent continued that the intent of the Code in governing stair width is to ensure that the width of the means of egress does not decrease in the direction of exit travel. This is clearly stated in the Uniform Building Code where it reads "(e)very landing shall have a dimension measured in the direction of travel not less than the width of the stairway" (UBC 1997, 1003.3.3.5 Landings). In dwelling units, however, the governing factors for assessing a landing size are the safety of use and functionality of the landing (i.e. for the purpose of moving furniture), rather than for exiting purposes. In this respect, the Agent emphasized that the width of the subject stairs is larger than that required by Code and, although the Code does not allow for a reduction in landing size in this instance, there is no hazard created where a landing has a length that is less than the stair width but is equal to or greater than the minimum stair width required by the Code (i.e. 700 mm, as noted above). No problems have been reported so far as a result of the deficiency in stair width at this location.

The Agent concluded by advising that they could have used winders in this instance, but their belief was that the landings would be a safer design and, while their deviation from the literal Code is minimal (25 mm to 50 mm), they completely comply with the intent of the Code. It was suggested that, for the reasons discussed above the minimal deficiencies in this case should be accepted.

6. Respondent's Position

The Respondent submitted that the plans presented with the application for building permits showed winders instead of landings. He further stated that the Code is clear in this regard and the landings, as constructed, do not meet minimum dimensions prescribed. He is, however, willing to uphold the Commission's ruling in this matter, whatever it may be.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-built landings that are not as long as the width of the stairs that they serve do not provide sufficiency of compliance with Sentence 9.8.4.1.(1) of the Ontario Building Code at units 15, 15a, 17 and 17a, Boulton Avenue, Toronto, Ontario.

8. Reasons

i. The landings, as constructed, do not comply with the intent of the OBC. A basic principle of the Code is that the width of the means of egress does not decrease in the direction of exit travel. This Code principle of egress width is measured from either wall face to wall face or door width, and is not measured between handrails and other allowed projections. In the subject stairs, the distance between wall faces is decreased at the landings.

ii. The Applicant has offered no compensation in order to achieve sufficiency of compliance.

RULING

1. **The Applicant**

   Mr. Emanuel Vommero, owner, Vommero Enterprises, Niagara Falls, Ontario, has received a building permit under the *Building Code Act, 1992,* and is currently constructing a new hotel known as the Econo Lodge, at Lundy's Lane, Niagara Falls, Ontario.

2. **Description of Constrution**

   The Applicant is currently constructing a new hotel structure classified as having a Group C - Residential occupancy. The building is described as five storeys in building height, 1,614 m^2 in building area and is of noncombustible construction. The hotel will be equipped with a fire alarm system, a sprinkler system and a standpipe and hose system.

   The hotel, when completed, is to have a total of 107 units, with 15 suites on the ground floor and 23 suites each on floors two through five. The ground floor of the proposed hotel will be provided with a limited number of specially designed barrier-free suites.

The construction in dispute involves the configuration of the egress doorways within the interior of the suites, in particular the amount of clear space provided on the latch side of the doors. The Applicant is proposing that in each unit 300 mm clearance be included between the latch side of the door and the demising wall that runs perpendicular to the corridor wall and that separates the suite's washroom from its interior hallway leading to the egress door. The doors of the subject hotel suites swing inward towards the interior of the units.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether Clause 3.8.2.1.(2)(k) of the Ontario Building Code, which permits an exemption from the requirement to provide barrier-free accessibility "within" residential suites, also applies to the design of the interior side of the egress doorways proposed for the subject hotel units. Article 3.8.2.1. determines which areas and which buildings are required to be barrier-free and which may be exempt.

Since this provision of the OBC deals with an exemption from a requirement, an understanding of the requirement itself is essential. In this instance, Sentence 3.8.2.1.(1) sets out the required construction. It states that, except under certain circumstances, a barrier-free path of travel shall be provided throughout the entrance floor and all normally occupied floor areas of a building as described below. Sentence 3.8.2.1.(2), including Clause 3.8.2.1.(2)(k), is a series of exceptions to Sentence 3.8.2.1.(1). Clause (k) specifically exempts the requirement for a barrier-free path of travel "within a suite of residential occupancy".

If, based on a review of Article 3.8.2.1., a determination is made that an area is required to be barrier-free, then certain additional construction requirements apply. Among these is Sentence 3.8.3.3.(11) which mandates the amount of clear space required beyond the latch side of a door with a closer located in a barrier-free path of travel. The requirement is a minimum of 600 mm when the door swings towards the approach side and a minimum of 300 mm when the door swings away from the approach side. The intent of this provision is to make it easier for individuals in wheelchairs to open a door and travel through it. As noted, the Applicant is proposing to provide 300 mm, not 600 mm, clear distance on the approach side of the inward-swinging suite doors.

The Code ensures accessibility into the subject hotel rooms by extending the barrier-free path of travel into residential suites. The key question, however, is whether the interior side of the suite

doors, as approached from the inside in order to exit, are considered to be "within" a path of travel that is required to be barrier-free. If so, the clear space requirements of Sentence 3.8.3.3.(11) are applicable.

4. **Provision of the Building Code**

Sentence 3.8.2.1. - Areas Requiring Barrier-Free Path of Travel

1. Except where essential obstructions in the work area would make a barrier-free path of travel hazardous, and except as provided in Sentences (2), (3) and (4), a barrier-free path of travel from the entrances required by Sentences 3.8.1.2.(1) and (2) to be barrier-free shall be provided throughout the entrance storey and within all normally occupied floor areas served by a passenger type elevator or other platform equipped passenger elevating device.

Clause 3.8.2.1. - Areas Requiring Barrier-Free Path of Travel

(2) The provision of a barrier-free path of travel in Sentence (1) does not apply:

(j) into suites of residential occupancy that are in storeys other than the entrance storey and that have all entrance doors at floor levels that do not correspond to elevator stop levels,
(k) within a suite of residential occupancy, or:

Sentence 3.8.3.3. - Doorways and Doors

(11) Every door equipped with a closer in a barrier-free path of travel shall have a clear space beyond the latch side of not less than:

(a) 600 mm where the door swings towards the approach side, and
(b) 300 mm where the door swings away from the approach side.

5. **Applicant's Position**

At the outset, the Agent for the Applicant stated that he viewed the subject dispute as one of interpretation of the OBC and he indicated that he hoped the Commission would view it likewise.

The Agent submitted that Sentences 3.8.2.1.(1) and (2) of the Code are clear. In his view, these Sentences indicate that the hotel corridors are not exempt and therefore are required to provide a barrier-free path of travel, but the inside of the residential suites, i.e., the hotel rooms, are exempt. He argued that the interior side of the suite door and the interior approach hallway leading to it are entirely inside the suite, thereby satisfying the meaning of the word "within" used in the subject exemption Clause. A literal interpretation of the Code can only reach the conclusion that the interior side of the suite door is not in the barrier-free path of travel, the Agent stated. Consequently, the requirement found in Sentence 3.8.3.3.(11) to provide 600 mm clear distance on the latch side of the door is not applicable.

The Agent then described the significant impacts the additional 300 mm, if required, would have on the entire design of the suites. First, the washrooms would have to be reconfigured so that their length would run parallel to the room and not the hotel corridor. This would have the effect of moving the washroom farther into the remainder of the suite and would cause considerable problems in terms of fitting the standard furniture expected in a hotel room such a two double beds, night tables, etc. In fact, the Agent indicated that one of the sides of one bed would essentially be only inches away from a wall. This situation, he noted, was not acceptable to his client. And since the building is currently under construction with floor slabs being poured such significant design changes could not be easily met.

The Agent concluded by stating that his firm has done numerous barrier-free projects and, in his own personal opinion, he would like to see the Code changed to expand the scope of accessibility. However, in the present case, the current OBC requirements did not mandate the 600 mm clear distance.

6. **Respondent's Position**

The Respondent submitted that the barrier-free path of travel required in the hotel corridor extends through the doorway and into the suite. He supported this argument by stating that "the only exemption for doorways into (original emphasis) a suite of residential occupancy is in 3.8.2.1.(2)(j) of the OBC for suites in other than the entrance storey where an elevator does not

stop." Clause 3.8.2.1.(2)(k) cannot be used to exempt residential suite doors, he continued, because it specifically "deals with the situation within (original emphasis) a suite of residential occupancy (washrooms, corridors, etc.)..." As a result, he argued, the suite door is a part of the barrier-free path of travel and this applies to both sides of the door. As the Respondent asked; why would the Code allow accessibility into an area but not out? Doesn't a barrier-free path of travel go in both directions?

The Respondent continued by arguing that if the door, both inside and out, is in the barrier-free path of travel, then the 600 mm clear space requirement of Sentence 3.8.3.3.(11) is applicable. The Respondent highlighted Sentence A.3.8.3.3.(11) of the Appendix to the Code to prove his point. He noted that this provision states the 600 mm distance should be provided for all doors, even those without closers.

The Respondent concluded by stating that they were looking for clarification of the Code. He indicated that if his view of the Code was incorrect then it should be amended to allow the disabled community greater ease in approaching and opening an egress door when exiting a residential suite, especially in hotel and short stay accommodation-type situations.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the exemption from the requirement to provide barrier-free accessibility "within" residential suites found in Clause 3.8.2.1.(2)(k) of the Ontario Building Code also applies to the design of the interior side of egress doorways. Moreover, since the barrier-free path of travel is not required within a suite of residential occupancy, then the requirements of Sentence 3.8.3.3.(11) are not applicable to the interior side of the suite entrance door.

8. **Reasons**

While the Commission is sympathetic to the Respondent's position, we believe that the meaning of Clause 3.8.2.1.(1)(k) is clear. It does not require a barrier-free path of travel within a suite of residential occupancy. In our interpretation, the exemption, which employs the word "within",

refers to the design of the interior of the residential suite. This, we believe, also includes the layout of the interior approach hallway leading to the egress door on the inside of the suite.

9. **Recommendation**

The Building Code Commission recommends that the Housing Development and Buildings Branch review these aspects of the Ontario Building Code to examine the possibility of amending such provisions to allow for greater ease of barrier-free egress with respect to hotels and similar use buildings that provide short term accommodation where the occupants may not be familiar with their surroundings.

RULING

1. The Applicant

?Mr. Gary Leblanc, 340268 Ontario Limited, Kitchener, Ontario, has received a building permit under the Building Code Act, 1992 to construct a wholesale warehouse known as Patene Building Supplies, 641 Speedvale Avenue West, Guelph, Ontario.

2. Description of Construction

The Applicant has constructed a building to serve as a wholesale warehouse for construction materials. The building consists of two main parts, a one storey warehouse portion which covers an area of 2119 m2 and a two storey administrative and sales portion with a building area of 558 m2. The building is described as having a Group F, Division 3 - Low Hazard Industrial major occupancy as well as a Group D - Business and Personal Services occupancy, which is subsidiary to the warehouse. The entire building is 2677 m2 in building area, two storeys in building height, and of noncombustible construction. The structure is equipped with a fire detection system, but not a sprinkler system nor a standpipe and hose system.

The subject building is rectangular in shape and has dimensions of 36.5 m by 73 m with its length constructed along the western property line. The property is also rectangular with dimensions of 114 by 242 m. The building is situated in the south-west corner of the property and is set back 4.4 m and 23.5 m

from the west and south property lines respectively. There is a 1060 m2 drive through canopy attached to the warehouse portion of the building's eastern exposing face. A parking lot adjacent to the street occupies the entire southern end of the property. The remainder of the site, to the north of the building and east of the canopy, is a material storage yard. The property is considered to face two streets and there are two fire hydrants near the property, one is located 6.4 m to the west of the building (on the adjacent property) and the other is 26 m from the front of the building (on its south side).

The structure is served by a total of six exit doors, with at least one on each exposing building face. As well, there are four large shipping doors, three on the east side and one on the north. There are 19 fire extinguishers located within the facility, four of which are on the exterior side of the building's east wall. The fire detection system includes thirty-four monitored detectors installed throughout the building, 31 of which are in the two floors of the office area and 3 are in the warehouse. It is ULC approved, provides zone indication and is centrally monitored with notification at the fire department. The occupant load of the building is 16, according to the Applicant.

The construction in dispute involves the omission of the standpipe and hose system. At 2677 m2, the subject building is required to be fitted with such a system. The Applicant describes the wall assembly separating the warehouse and office areas as being firestopped with a minimum fire resistance rating of 1.5 hours and equipped with doors with closing devices. (Between such occupancies, the OBC does not require a fire separation. Nevertheless, it is not considered a firewall that would create two smaller buildings for Code purposes.) This wall also has several wired glass window openings between the shipping office on the ground floor, the lunchroom on the second floor and the warehouse. It also has three doors to allow access between the two areas.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the various compensating construction measures, offered in lieu of a standpipe and hose system, provide sufficiency of compliance with Sentence 3.2.9.1.(1) of the Ontario Building Code. This provision requires that every building (with a few exceptions that are not applicable here), which is more than three storeys in building height, 14 m in height (measured between grade and the ceiling of the top storey), or of a certain building area if the building is unsprinklered, to be equipped with a standpipe system. If the final situation is applicable, the building area thresholds are set out in Table 3.2.9.1.

Table 3.2.9.1.

Occupancy Classification	*Building Area*, m^2 (ft^2)		
1 *Storey*	2 *Storeys*	3 *Storeys*	
A C D F, Division 2 F, Division 3	2 500 (24,200) 2 000 (21,500) 4 000 (43,100) 2 000 (21,500) 3 000 (32,300)	2 000 (21,500) 1 500 (16,100) 3 000 (32,300) 1 500 (16,100) 2 000 (21,500)	1 500 (16,100) 1 000 (10,800) 2 000 (21,500) 1 000 (10,800) 1 000 (10,800)
Column 1	2	3	4

According to this Table, an F3 building two storeys in building height may have a maximum area of 2000 m2 or less in order to be exempted from the requirement to install a standpipe and hose system. The subject building is considered two storeys in building height and has an area of 2675 m2. As noted, however, the Applicant is offering certain compensating measures in lieu of providing the standpipe system. At issue then, is whether subject measures are adequate to achieve the same level of safety offered by a standpipe system and thereby provide sufficiency of compliance with Sentence 3.2.9.1.(1).

4. Provisions of the Ontario Building Code

Article 3.2.9.1. **Standpipe Systems - Where Required**

1. Except as provided in Sentences (4) to (7), a standpipe system shall be installed in every building that
   a. is more than 3 storeys in building height,
   b. is more than 14 m (45 ft 11 in) high measured between grade and the ceiling of the top storey, or
   c. is not more than 14 m (45 ft 11 in) high measured between grade and the ceiling of the top storey but has a building area exceeding the area shown in Table 3.2.9.1. for the applicable building height if the building is not sprinklered.

5. Applicant's Position

The Applicant submitted that the five principle measures they are offering in lieu of the required standpipe system provide adequate compensation to meet the fire safety standards intended under Article 3.2.9.1. These compensatory measures are:

- A fire separation with a 1.5 hr fire resistance rating between the warehouse and the office portions of the building;
- A monitored fire detection system and numerous fire extinguishers throughout the building;
- Proximity to the fire fighting department;
- Proximity to two hydrants and good fire fighting access to 90 % of the building; and,
- Extremely low fire load.

The Applicant noted that no separation is required under the Code between the warehouse and the office building, and as a result he argued that the as-built 1.5 hour wall can be considered as a significant compensating measure.

The Applicant then noted that the fire detection system, with a total of 34 monitored detectors, will provide a comprehensive and interconnected level of fire detection throughout the building. The as-installed fire detection system, he argued, also provides a higher level of early warning than is required by Code for such a building. As well, the 19 fire extinguishers that are strategically placed around the structure will provide a good level of protection in the early stages of a fire emergency. Moreover, the staff have been trained by the fire department in terms of the use of the extinguishers, he added.

Regarding the proximity to the fire department, the Applicant stated that the building is located only 4 km from the nearest municipal fire station which means that their response time to his facility is less than five minutes. As far as the proximity of hydrants is concerned, he noted that there are two hydrants, one to the west and one to the front, of the building at an approximate distance of 6.4 m and 29 m respectively. As a result, the building is well served by hydrants.

The Applicant also indicated that because the building is of entirely noncombustible construction and is used as a wholesale facility for mainly noncombustible building materials, such as drywall and masonry, the fire load of the building and its contents is extremely low. He noted that materials such as roofing products are stored outside.

The Applicant concluded that the compensating measures provided, combined with the low occupant load of 16, is sufficient to achieve the same level of safety offered by a standpipe and hose system.

6. Respondent's Position

The Respondent submitted that the building area of the Patene Building Supplies facility is in excess of the area specified in Table 3.2.9.1 by 33%. As a result, he stated that the building is required to be equipped with a standpipe and hose system.

The Respondent argued that no relief from the standpipe system can be obtain as a result of the 1.5 hour fire rated wall separating the office and warehouse areas. This wall, he noted, is not a firewall that would serve to divide the building into two separate ones. Moreover, the subject fire separation has been breached by several penetrations. As well, the Code does not offer specific allowances providing relief from a standpipe system with the provision of such compartmentalization, he added.

The Respondent indicated that while the fire detection could be construed as above minimum Code requirements, it is not a full fledged system that would provide a substantial compensating measure. For example, the fire detection system does not have pull stations.

The Respondent stated that to his knowledge the hydrant to the west of the building is a private one on the adjacent property, thus making it uncertain whether it can be used for the building under dispute, if necessary. Besides, even if the hydrant can be used for the Applicant’s property, there are few openings in the west wall of the building to offer a decent level of accessibility into the structure.

Finally, the Respondent argued that while the building is currently used as a facility that stores and supplies mainly noncombustible building material, the situation may not remain that way. The Applicant, or a future purchaser, may decide at a later date to supply combustible materials instead. When, or if, this occurs the building department would have no control or input to require a standpipe system at that time, the Respondent said.

In conclusion, the Respondent acknowledged that certain levels of compensation were being offered, however, he indicated that, in his view, they were not sufficient to offset the need for the required standpipe system.

7. Commission Ruling

It is the decision of the Building Code Commission that the various proposed compensating construction measures, offered in lieu of a standpipe and hose system, do not provide sufficiency of compliance with Sentence 3.2.9.1.(1) of the Ontario Building Code at Patene Building Supplies, 641 Speedvale Avenue West, Guelph, Ontario.

8. Reasons

a. The measures offered to achieve sufficiency of compliance were not commensurate with the substantial amount of building area found in the existing structure over the threshold of allowable building area in Table 3.2.9.1.
b. Some of the measures offered as compensation such as occupant or fuel loads may be transitory and could change significantly and quickly.
c. The use of the building, as Group D and F3 occupancies, is not one such as a steel plant or heavy industry that may create a hazard if a standpipe and hose system is introduced to the structure.

RULING

1. **The Applicant**

   Mr. D. J. Thomas Dutton, Vice-President, Renaissance (Villa Giardino) Community Corporation, Toronto, Ontario, has applied for a building permit under the *Building Code Act, 1992*, to construct a retirement home known as Villa Giardino, at 7365 Martin Grove Road, Vaughan, Ontario.

2. **Description of Constrution**

   The Applicant is proposing to construct a new, L-shaped, retirement facility intended as a residence for elderly people of European background. The building is to contain a total of 124 suites, a few of which may have dual occupancy at times, thus resulting in a maximum number of residents of approximately 130 persons. The operating philosophy, as described by the Applicant, is to encourage an independent lifestyle for the residents with most suites containing small kitchenettes thereby resembling apartments. As well, so that some degree of "age in place"

flexibility is provided in the building, an entire floor has been designed as an assisted living area where food is prepared and a level of nursing service is offered.

The proposed building is described as five storeys in building height, 1,756 m^2 in building area, and is of noncombustible construction. It will be equipped with a full sprinkler system with quick response sprinkler heads, a fire alarm system and a standpipe and hose system. The structure will be connected at two levels to an existing retirement facility on the adjacent lot to the east.

The Applicant and Respondent have apparently agreed that the subject building should be classified as having Group A - Division 2, Group B - Division 3 and Group C occupancies. The Applicant has elected to construct the subject building according to the occupancy with the most stringent standards, in this case the B3 occupancy. Because of the height of the building, the specific provision involved is Article 3.2.2.38., "Group B, Division 2 or Division 3, Any Height, Any Area, Sprinklered". A floor by floor description of the building follows below:

Due to the moderate slope at the site, the ground floor is proposed as having two levels (referred to as the lower main floor and the upper main floor). As designed, the lower main floor is to be entirely below grade at the north end of the building, whereas at the south it would be at grade. The proposed connection to the adjacent six storey existing building to the east would be provided at both the upper and lower main floor levels. On the upper main floor a vestibule-type walkway is proposed to be constructed onto the east end of the new building. The punch out panel on this level in the exterior west wall of the existing building would be removed to create the passageway into that building. The exposing wall construction proposed at either end of the vestibule includes a new masonry or concrete partition wall with wired glass screen in the new building which is rated as providing a 2 hour separation from the walkway and a solid masonry wall in the existing building offering a 2 hour separation. The vestibule itself will be built with a 2 hour rated concrete roof supported by 2 hour rated construction and enclosed with glass partition walls on the north and south.

Below the walkway area, however, at the lower main floor, the new building is to be extended to the existing one, with the space presently proposed as storage. As such, at this level the existing building's punch out panel would remain. Three of the storage room's four walls would be in the new building and would be constructed with 2 hour rated concrete and masonry. The west facing 2 hour rated exposing wall of the existing building would comprise the fourth wall of this room. This area will also be capped by a 2 hour concrete slab. No east facing exposing wall is to be

constructed in the new building's connecting storage room that would abut the existing building's west wall.

The east-west wing of the main levels is to contain the A2 occupancy. Included in this area is a lounge, lobby, wellness centre, chapel, wine tasting room, hair salon and a pool on the lower main floor and a library, gallery, crafts room and dining and kitchen facilities on the upper main floor. (This area contains some administrative and utility space as well.) Also contained within the A2 occupancy is a large opening in the floor area connecting the two levels of the main floor. The opening occurs in the north-west corner of the building where the principal entrance is located. A large curved stair connects the two levels of the opening. As a result of this floor penetration, the entire A2 area is considered to be an interconnected floor space.

The north-south wing of the main floors is proposed as having a Group C occupancy and is intended for independent, ambulatory residents. A total of 16 units will be provided on the two levels, nine of which will be studios and seven as one bedroom suites. This area will be separated from the adjoining A2 space by a 2 hour fire separation. Exiting on the lower main floor is by an exit door directly to the exterior at the south end of the corridor. As well, all suites on this level are provided with an exit door to patio areas at grade. Occupants of the upper main floor are served by two exit stairs (No. 3 and 4) leading directly to the exterior, one at the north end and one at the south end of the corridor.

The second floor is proposed as the B3 care occupancy area. It is to consist of 32 units, an assisted dining room, a nurse's station with medical room, amenity space and a linen area. This floor will be separated by a 2 hour separation from the A2 and C occupancies below. Two corridors will serve the units on this floor, one is to run east/west while the other north/south. The exiting will be provided by three exit stairs; Stair No. 1 at the east end of the east/west corridor, Stair No. 3 at the south end of the north/south corridor, and Stair No. 2 located where the two wings of the building converge. While the occupants of this floor will be provided with a level of care, including their own dining facilities, they will not be prevented from visiting other areas of the building. To do so, however, they may require assistance.

The east/west corridor on the second floor will not terminate precisely where the north/south corridors begins, it is to extend approximately 1.8 m to the west beyond the intersection point with the north/south corridor. In this area the east/west corridor also widens to form a rectangular space to which access is provided to four suite doors.

Floors three to five are classified as having a Group C occupancy and are also for independent, ambulatory occupants. The third and fourth floors will have the same L-shaped configuration as the second floor. These floors will include 31 units each (a mix of studio and one bedroom suites), laundry facilities and amenity areas. The fire resistance rating of the separation between the third floor and the B3 occupancy below will also be 2 hours. The exiting arrangement on this floor will be identical to that of the second floor. These two floors have the same corridor configuration as the second floor, except that in the area where the east/west corridor extends beyond the intersection point of the north/south corridor only three suite doors are proposed. The corridor design, however, is not an issue on the Group C floors.

The building is proposed to extend to a fifth floor in the eastern portion of the east/west wing only. This floor will contain 14 units, most of them one bedroom suites, as well as the laundry and amenity areas found on other floors. The exiting for this floor will be via Stairs No. 1 and 2 at the east and west ends respectively of the corridor.

The proposed construction in dispute involves three areas; the interconnected floor space in the A2 occupancy, the second floor corridor design, and the connection between the new and old buildings.

3. **Dispute**

There are three issues at dispute between the Applicant and the Respondent. On the first issue the primary question is whether, in a building containing a B3 occupancy, an interconnected floor space is permitted when considering Sentence 3.2.8.1.(3) of the Ontario Building Code. This provision prohibits floor areas containing sleeping rooms to be built as a part of an interconnected floor space in a building that contains a B2 or B3 major occupancy. As noted, the proposed building will contain a B3 occupancy on the second floor and the Group C areas on the upper and lower main floor will be on the same level as the interconnected floor space to be located in the A2 area. A 2 hour separation, however, will divide these three occupancies. At issue therefore is whether Sentence 3.2.8.1.(3) is applicable to the subject building and whether it can be read as preventing the construction of the interconnected floor space.

If the answer to the first question is that an interconnected floor space is allowed in the Villa Giardino building, the subsequent question then becomes whether the proposed design of the floor penetration complies with the conditions (see below) set out in OBC Sentence 3.2.8.2.(6)

and, if so, thereby may be exempt from the construction requirements for buildings with an interconnected floor space as determined in Articles 3.2.8.3. to 3.2.8.11. While the first two conditions, (a) and (b), in Sentence 3.2.8.2.(6) clearly seem to be met in the proposed structure, the fulfilment of condition (c), which excludes certain occupancies from being in an interconnected floor space area, causes dispute. Since the common activity rooms located in the A2 interconnected floor space area may, through the provision of assistance and/or supervision, be used by residents from the B3 floor, the issue then becomes whether the restrictions of the B3 classification should be extended into the A2 zone.

The second issue is whether the proposed design for the second floor B3 occupancy corridor that includes a roughly 1.8 m extension of the east/west corridor past the connection point of the north/south corridor is considered a dead end corridor and thus contravenes Sentence 3.3.3.3.(1) of the OBC. This provision stipulates that corridors used by the public or serving patients or residents must not have a dead-end portion unless that part of the building is provided with a second and separate means of egress. The layout of the east/west corridor on the second floor does continue beyond the intersection point with the north/south corridor. Further, this part of the building is not served with a separate means of egress. Nevertheless, the length of corridor in question is only approximately 1.8 m. Moreover, the Code does not define when a certain corridor configuration for this occupancy must be considered a dead-end situation.

The third dispute involves the design of the proposed two level connection to the existing building on the adjacent site. Regarding the upper main floor, the question is whether the connection may be considered a walkway and would therefore be permitted to comply with Article 3.2.3.18. of the OBC. This Article dictates the construction requirements (see below) for walkways connecting two adjacent buildings. Pertinent to this discussion are the requirements that the walkway must be noncombustible when the two connected buildings are noncombustible construction and that at least a 45 minute separation be provided at both ends of the walkway when it is closed.

The walkway referred to in OBC 3.2.3.18. is defined in Article 1.1.3.2. as "a covered or roofed pedestrian thoroughfare used to connect 2 or more buildings". As stated in the March 20, 2000 Technical Background Information memo issued for this dispute by the Housing Development and Buildings Branch, " (t)his definition implies that a *walkway* [original emphasis] is a separate entity that is used to connect 2 or more buildings. As such, it should not be part of any of the buildings that it connects to". We agree. And while the proposed upper main floor building connection, or walkway, appears that it will be separated from the new and existing structures at

this level, the entire walkway, however, runs directly on top of the storage room below. In our view, this contravenes the meaning of walkway as envisaged by the Code.

Thus, as two physically connected buildings with a doorway penetration, the issue then becomes whether the current design provides sufficiency of compliance with either of the ways the OBC permits a separate building to be contiguous or closely spaced with another building. The relevant provisions are Subsection 3.1.10., "Firewalls", or Articles 3.2.3.1., "Limiting Distance and Area of Unprotected Openings", and 3.2.3.7., "Construction of Exposing Building Face." The difference in terms of construction in order to conform with these provisions is that for the subject building a 2 hour rated wall would be required to achieve a firewall, whereas a 1 hour rated wall is necessary in the case of an exposing building face with 0 m limiting distance.

Regarding the storage room, the issue is the same. As noted, there is no exposing wall of the new building proposed at the east end of the storage room that would face or abut the west wall of the existing building. Essentially, one of the four walls in the new building's storage room is comprised of the west-facing wall of the existing building.

4. **Provision of the Building Code**

Sentence 3.2.8.1. - Mezzanines and Openings through Floor Assemblies

1. ,
2. ,
3. A floor area containing sleeping rooms in a building of Group B, Division 2 or 3 major occupancy shall not be constructed as part of an interconnected floor space.

Sentence 3.2.8.2. - Exceptions to Special Protection

6. A interconnected floor space need not conform to the requirements of Articles 3.2.8.3. to 3.2.8.11. provided:

d. the interconnected floor space consists of the first storey and the storey next above or below it, but not both,
e. the interconnected floor space is sprinklered, and
f. the interconnected floor space contains only Group A, Division 1, 2 or 3, Group D, Group E, or Group F, Division 3 occupancies. (See Appendix A.)

Sentence 3.3.3.3. - Corridors

7. A corridor used by the public or serving patients or residents shall have no dead-end portion unless the area served by the dead-end portion has a second and separate means of egress.

Article 3.2.3.18. - Walkway between Buildings

8. Except as required by Sentence 3.2.3.19.(2), if buildings are connected by a walkway, each building shall be separated from the walkway by a fire separation with a fire-resistance rating not less than 45 min.
9. Except as permitted by Sentence (3), a walkway connected to a building required to be of non-combustible construction shall also be of non-combustible construction.
10. A walkway connected to a building required to be of non-combustible construction is permitted to be of heavy timber construction provided:
    a. not less than 50% of the area of any enclosing perimeter walls is open to the outdoors, and
    b. the walkway is at ground level.
11. A walkway of noncombustible construction used only as a pedestrian thoroughfare need not conform to the requirements of Articles 3.2.3.13. and 3.2.3.14.
12. A walkway between buildings shall be not more than 9 m (29 ft 6 in) wide.

Subsection 3.1.10. - Firewalls

(REFER TO OBC)

Clause 3.2.3.1. - Limiting Distance and Area of Unprotected Openings

13. Except as permitted by Articles 3.2.3.9. to 3.2.3.11., the area of unprotected openings in an exposing building face for the applicable limiting distance shall not be more than the value determined in accordance with:

n. ,
o. Table 3.2.3.1.C. or Table 3.2.3.1.D. for an exposing building face conforming to Article 3.2.3.2. of a sprinklered fire compartment that is part of a building which is sprinklered in conformance with Section 3.2.

(See A-3, Fire Fighting Assumptions in Appendix A.) (See also Section 3.13.)

Sentence 3.2.3.7. - Construction of Exposing Building Face

16. Except as permitted by Articles 3.2.3.9. and 3.2.3.10., if a limiting distance shown in Table 3.2.3.1.A. or Table 3.2.3.1.C. for Group A, B, C, D or Group F, Division 3 occupancy classification permits an exposing building face to have unprotected openings not more than 10% of the exposing building face, the exposing building face shall be:

q. of non-combustible construction having a fire-resistance rating not less than 1 h, and

r. clad with non-combustible cladding.

5. **Applicant's Position**

Regarding the issue of whether an interconnected floor space is permitted in a building that contains a B3 occupancy, the Agent for the Applicant submitted that Sentence 3.2.8.1.(3) makes no such prohibition. In his view, this provision simply seeks to prevent an interconnected floor space from being located in a B3 occupancy and does not preclude the possibility that one may be constructed in a building that houses somewhere within a B3 occupancy. OBC 3.2.8.1.(3) is not applicable to the subject design, he argued, because it proposes that the B3 be located wholly on the second floor and the interconnected floor space only on the upper and lower main floors, thereby completely separating the occupancies. Moreover, the only dwelling units on the main floor levels are classified as Group C occupancies and they are also separate from the A2 area. As he noted, the A2 area containing the interconnected floor space, the main floor Group C and the second floor B3 are all separated from each other by two hour separations.

In so far as the question of whether the interconnected floor space requirements of Articles 3.2.8.3. to 3.2.8.11. must be met, due to the fact that the B3 residents, with assistance, may occasionally use the amenity area found in the A2 space, the Agent argued that the presence of B3 occupants in the A2 area does not change the A2 into a B3 occupancy. "This (the Agent stated) is consistent with long established means of regulating hospital (B2) occupancy design. Patient care areas which are considered to be B2 occupancies are typically patient sleeping rooms and medical treatment facilities where patients are immobilized or unconscious, such as operating theatres. Portions of hospital buildings containing examination rooms, clinics or facilities such as physiotherapy treatment areas are considered to be Group D business and personal services occupancies and are not required to be designed to the requirements applicable

to B2 occupancies. If this is the approach to the assigning of occupancy classification in hospitals, it does not make sense that a more restrictive approach should apply to a building containing a B3 occupancy on one floor level.

"In the context of hospital and nursing home design, OBC Subsection 3.3.3. has always been understood as applying to patient sleeping or medical treatment areas and not to other portions of the building where patients or residents may happen to visit for consultation, eating, recreation or even some forms of treatment.

"OBC 3.2.8.1.(3) has been cited as a basis to deny the design of the interconnected floor space. The argument would seem to be that any floor area containing sleeping rooms - even if the entire floor area was to be regarded as Group C occupancy - could not have a portion of the floor area (not including the sleeping rooms) designed as an interconnected floor space because somewhere else in a portion of the building remote from the interconnected floor space there was a B3 occupancy. This does not appear to be reasonable; our interpretation of this sentence is that the sleeping rooms in question are B2 or B3 sleeping rooms in which case the portion of floor area containing such sleeping rooms is not to be constructed as part of an interconnected floor space.

"This argument is reinforced by OBC 3.2.8.6. which applies to B occupancy sleeping rooms in a larger atrium building where configurational and smoke control restrictions are imposed on the atrium design. In such case(s) (sic) it is clearly recognized that Group B sleeping rooms can be in a floor area which is, in part, within an interconnected floor space, as long as the portion of floor area containing the B sleeping rooms is not within the interconnected floor space.

"OBC 3.2.8.6.(1) is not referenced as an exception to OBC 3.2.8.1.(3); this strongly supports the notion that the intent of OBC 3.2.8.1.(3) is to preclude a portion of a floor area containing B occupancy sleeping room from being within an interconnected floor space and that other portions of the same floor area could be within an interconnected floor space."

Regarding whether the interconnected floor space construction requirements are applicable, the Agent stated:

"There is no application to OBC Articles 3.2.8.3. to 3.2.8.11. for the case at hand. The design is intended to comply with OBC 3.2.8.2.(6) which concerns a 2-storey interconnected floor space where one of the storeys is the first storey.

"All three conditions in 3.2.8.2.(6) are met; the occupancies in the interconnected floor space are Group A2 or D (not Group B); the interconnected floor space consists of portions of the first two storeys of the building; the interconnected floor space is sprinklered.

"It is worth noting that OBC 3.2.8.2.(6) now only refers to "occupancies" in terms of those uses which are permitted within the interconnected floor space. Previous editions of the Code referred to "major occupancies" which occasionally resulted in problems when a very literal-minded building official was applying the Code sentence. For example, 2-storey interconnected floor spaces containing recreational facilities in a Group C major occupancy apartment building were sometimes questioned because the reference was to major occupancies and not occupancies in general. If amenity spaces which are subsidiary components of a Group C occupancy apartment building are permitted to be in an interconnected floor space, even though they are held by some to be subsidiary components of the major Group C occupancy, then the same principle should apply to amenity areas in an interconnected floor space in a building which contains Group C and B3 major occupancies."

On the issue of the second floor corridor design, the Agent disputed that it represented a dead-end situation and instead likened it to an alcove. He noted that since there is no Code definition for a dead-end corridor for such a building, then it is up to common sense interpretation to determine whether such a condition applies. In his view, "a dead-end condition occurs when someone in that portion of corridor has no choice of travel in different directions" and "travel is constrained in one direction for some distance before a choice of direction of travel is available". This is not the case in the present situation, he argued.

The Agent then described how in the past the opinion of the Housing Development and Building Branch was that if there was a niche or alcove in a corridor design where the width of the space did not exceed its depth then it need not be considered as a dead-end. He argued that such an interpretation represented a functional common sense application as to what construes a dead-end situation and would clearly exempt the Villa Giardino example.

To ameliorate the potential for any practical or Code compliance issues regarding this corridor, the Agent offered two solutions. The first involved reconfiguring the partition walls in the corridor so that the alcove becomes part of a U-shaped corridor design. The second was to add additional exit signs providing direction at the intersection point of the corridors.

With respect to the issue of the connection to the adjacent building, the Agent maintained that the proposed walkway on the upper main floor does comply with the definition thereof in the

OBC. He argued that the Code definition does not impose any restrictions on design, it simply describes what a walkway is. And this description, in his view, encompasses the subject Villa Giardino design.

Regardless of whether the Commission accepts the proposed design as a walkway, the Agent argued that the intended construction at both the upper and lower main levels would provide an adequate level of fire safety. In describing the storage room, he reiterated that there is no passageway between the two buildings and that the room is surrounded by 2 hour rated walls and ceiling. The walls at either end of the walkway (especially the existing building's wall) would provide more than a 45 minute separation as required by Article 3.2.3.18. and the concrete roof is to be 2 hour rated. The Agent did, however, offer to upgrade the new building's walkway wall to a 1.5 or 2 hour separation.

6. **Respondent's Position**

At the outset, the Respondent indicated that the proposed retirement home was a facility that caused him some concern for several reasons. For example, while the Code views the structure as being five stories in reality it is six levels. It is also to be built very close to the neighbouring building. Moreover, he indicated that he was not entirely comfortable with the classification of the building. As a result, he argued that it was important to consider the three disputed areas seriously. Any further concession might be quite detrimental to the safety of the building.

On the issue of whether an interconnected floor space is allowed in the subject building, the Respondent submitted that his reading of Sentence 3.2.8.1.(3) is that it prohibits such a floor penetration in a building that houses a B3 occupancy. This, he noted, clearly creates a non-compliant situation with respect to the proposed A2 interconnected floor space area. He continued by stating that if only Group C occupancies existed outside of the A2 area, then conformance with Sentence 3.2.8.1.(3) would be achieved.

The Respondent then argued that if an interconnected floor space were to be allowed, it should have to meet the construction requirements of Articles 3.2.8.3. to 3.2.8.11. In his view, these provisions must be met because condition (c) of Sentence 3.2.8.2.(6) has not been met. This Clause sets out what occupancies can be found in an interconnected floor space and Group C and B3 uses are not among them. As he argued, since the residents of especially the B3 floor, through supervision or assistance, have access to the amenity areas on the A2 floor space, then the level

of protection provided in the B3 area should be extended into the A2 zone. This should result in the omitting of the interconnected floor space entirely from the building's design, but at a minimum the floor penetration should be compensated for by complying with OBC 3.2.8.3. to 3.2.8.11.

With respect to the corridor design issue, the Respondent stated that the current layout contains a dead end situation. Sentence 3.3.3.3.(1) does not permit such a condition. Unlike other occupancies, no dead end corridors of any length are allowed in the proposed structure.

Regarding the building connections, the Respondent noted that the walkway is to sit on top of part of the new building, i.e., the storage room. As a result, he argued that the walkway does not meet the Code definition of being a structure between two buildings and thus must meet either the firewall standards or the exposing building wall at 0 m limiting distance requirements. The design of the storage room, he submitted, makes it clear that the new building is being extended directly to the old, and the fact that no fourth wall facing the old building was to be constructed concerned him. He also indicated concern about the potential storage of combustible materials in this room. The Respondent thought that compromises should not be made on the building connections because the proposed work involves new construction.

7. **Commission Ruling**

It is the decision of the Building Code Commission (BCC) that the proposed building, which is to contain a B3 occupancy on a remote and separated floor from an interconnected floor space within the structure, complies with Sentence 3.2.8.1.(3) of the Ontario Building Code and the location of separated Group C occupancies that are to occupy a portion of the same floors containing the interconnected floor space are also in compliance with the Ontario Building Code.

It is also the decision of the BCC that the subject interconnected floor space complies with Sentence 3.2.8.2.(6) and need not meet the construction requirements of Articles 3.2.8.3. to 3.2.8.11. of the OBC.

It is also the decision of the BCC that the "alcove" located in the public corridor at the north-east corner of the second floor is not considered to be a dead end situation provided two exit signs are installed to define the direction of egress in the area of the alcove.

And it is also the decision of the BCC that the connections between the adjacent existing building meets the intent of the Code provided a vertical fire separation conforming to either Subsection 3.1.10. or Clause 3.2.3.1.(1)(b) and Sentence 3.2.3.7.(1) be incorporated into its design.

8. **Reasons**

. The occupancies are separated from the interconnected floor space by 2 hour fire separations that are equal to the rating of the floor slab and therefore are deemed to be not within the interconnected floor space.

a. The interconnected floor space is located entirely within an area considered to be an A2 occupancy.

b. The length of dead end corridor is minimal and the width of the alcove exceeds its depth.

c. The area proposed as a walkway does not conform to the OBC's definition since it is placed directly upon a portion of the new building.

d. The new building at both the upper and lower main floor levels does not have an exposing building wall at the property line.

BCC Ruling No. 00-14-746

BUILDING CODE COMMISSION DECISION ON B.C.C. #00-14-746

IN THE MATTER OF Subsection 24 (1) of the Building Code Act, 1992.

AND IN THE MATTER OF Sentences 9.8.4.1.(1), 9.8.7.1.(1), (2) and 9.8.7.2.(2) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99, 278/99, 593/99 and 597/99 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Gordon Naismith, Project Manager, Van Lagen Homes, Norwich, Ontario, for the resolution of a dispute with Mr. Doug Robertson, Chief Building Official, Town of Tillsonburg, Ontario, to determine whether the as-built stair landing that measures 1093 by 915 mm and serves a stair 1093 mm in width, the lack of a second handrail in a 1093 mm wide stair and the absence of a railing at the lower flight (comprised of two risers) in the stair between the ground and second floor provide sufficiency of compliance with Sentences 9.8.4.1.(1), 9.8.7.1.(1) and 9.8.7.2.(2) respectively of the Ontario Building Code at the Robinson residence, 2 Eden Place, Tillsonburg, Ontario.

The Respondent

RULING

1. The Applicant

Mr. Gordon Naismith, Project Manager, Van Lagen Homes, Norwich, Ontario, has received a building permit under the Building Code Act, 1992 and has recently constructed a single, detached dwelling at 2 Eden Place, Tillsonburg, Ontario.

2. Description of Construction

The Applicant has recently constructed a new single, detached Group C residential occupancy. The building is described as 167.3 m^2 in building area and two storeys in building height.

As part of the construction the Applicant built an access to egress stair between the ground floor and the second floors. The stair is "L-shaped" and consists of two flights and a landing. The lower flight has two risers and is 915 mm (36") in width and the upper flight has twelve risers and is 1093 mm (43") wide.

The construction in dispute involves the width of the stair landing. The landing measures 1093 by 915 mm, while the width of the stairs in which the landing occurs is 1015 mm. As well, the upper flight of the stair is equipped with a single handrail and the lower flight has no handrails on either side.

3. Dispute

There are three issues in dispute between the Applicant and the Respondent. The first is whether the as-built stair landing that measures 1093 by 915 mm and serves a stair 1093 mm in width provides sufficiency of compliance with Sentence 9.8.4.1.(1) of the Ontario Building Code. This provision requires a landing to be as wide and as long as the width of the stairs in which it occurs. The as-built landing is as wide as the width of the subject stairs, however, the length of the landing is less than the width of stairs.

The second issue is whether the subject stair, which measures 1093 mm (3' 7") in width but which has only one handrail, provides sufficiency of compliance with Sentence 9.8.7.1.(1). Specifically, this provision stipulates that handrails must be installed on at least one side of stairs less than 1093 mm in width and on both sides of stairs 1093 mm in width or greater. As noted, the stairs in question are 1093 mm in width but have only one handrail.

The third issue pertains to whether the absence of a railing at the lower flight (comprised of two risers) provides sufficiency of compliance with Sentence 9.8.7.2.(2) of the Ontario Building Code. Sentence 9.8.7.2.(2) mandates that a continuous handrail must be installed throughout the length of a stairway, including landings. The stair in question does not have a continuous handrail throughout its entire length.

4. Provisions of the Ontario Building Code

Sentence 9.8.4.1. Dimensions of Landings

(1) Landings hall be at least as wide and as long as the width of stairs in which they occur, except that

(a) the length of landing for exterior stairs serving not more than 1 dwelling unit need not exceed 900 mm (2 ft 11 in), and

(b) the length of landing for all other stairs in a straight run need not exceed 1,100 mm (3 ft 7 in).

Sentence 9.8.7.1. Required Handrails

(1) Except as permitted in Sentences (2) and (3), a handrail shall be provided on

- at least one side of stairs less than 1 100 mm (3 ft 7 in) in width,
- two sides of stairs 1 100 mm (3 ft 7 in) in width or greater, and
- two sides of a curved stair used as an exit.

(2) Handrails are not required for stairs within dwelling units having not more than 2 risers, or for exterior
stairs having not more than 3 risers and serving not more than one dwelling unit.

Sentence 9.8.7.2. Continuous Handrail

(2) Except as provided in Sentence (2), at least one handrail shall be continuous throughout the length of the stairway, including landings, except where interrupted by

(a) doorways, or

(b) newel posts at changes in direction.

5. Applicant's Position

The Applicant submitted that there are two ways to make the present situation comply with Sentence 9.8.4.1.(1). The first would be to reduce the width of the stair and the second would be to increase the length of the landing by reducing the depth of the stair run. He argued that "reducing the width of the stair to match the depth of the landing does not serve any reasonable purpose." The applicant felt that because of the constraints at the top and bottom of the stairway, it would not be possible to alter the size of the landing. Moreover, the option of reducing the depth of the stair run would not result in a safer solution, he argued.

In addition, the Applicant stated that the current size of the landing provided superior appearance and functionality and thus he indicated that increasing the size of the landing would not be necessary. He

argued that this situation was "minor," as the width difference of the stairs involved was only a few inches. It was further noted that the stairs in question have a "90 degree" turn in the landing which adds to their safety. Full compliance with Sentence 9.8.4.1.(1) is more essential, he asserted, when considering a straight stair.

Regarding the issue of the second handrail, the Applicant conceded that an extra railing on the opposite side could be required and was willing to comply if necessary. However, he noted that the stairs were exactly at the 1093 mm (3' 7") threshold.

On the issue of the continuous handrail, the Applicant argued that since the lower flight consisted of only two stairs Sentence 9.8.7.1.(2) allowed the handrail requirements to be waived. However, he also acknowledged that the two flights together constituted one continuous stair.

6. Respondent's Position

The Respondent submitted that not only does the size of the landing not comply with requirements of the Ontario Building Code (OBC), but the handrails provided also are not in conformance with Code.

He noted that the OBC clearly states that the length and width of a landing shall be equal to the width of the stair in which it occurs. Therefore, either the landing length or the stair width must be adjusted such that the requirements of Sentence 9.8.4.1 (1) are satisfied.

In reference to Sentence 9.8.7.1.(1), the Respondent argued that since the subject stairs are 1093 mm (3' 7") in width, handrails are required on both sides, and not just one as has been built. As well, he indicated that a handrail continuing from the landing newel post to the ground floor was necessary as per Sentence 9.8.7.2.(2). He noted that the exemption for handrails in OBC 9.8.7.1.(2) was for entire stairs within a dwelling unit with two risers or less, and not for flights within a stair.

Lastly, the Respondent stated that he would be satisfied if a solution could be reached, but indicated that he felt he did not have the authority to approve the constructed stairs.

7. Commission Ruling

It is the decision of the Building Code Commission that the as-built stair landing measuring 1093 by 915 mm and serving a stair 1093 mm in width provides sufficiency of compliance with Sentence 9.8.4.1.(1) of the Ontario Building Code.

It is also the decision of the Building Code Commission that a second handrail is not required in the subject stairs, as the said construction provides sufficiency of compliance with Sentence 9.8.7.1.(1) of the Ontario Building Code.

It is also the decision of the Building Code Commission that the existing handrail, which is omitted at the lower flight (comprised of two risers) in the stair between the ground and second floor does not provide sufficiency of compliance with Sentence 9.8.7.2.(2) of the Ontario Building Code.

8. Reasons

1. The width of the stairwell and the smallest dimension of the landing both exceed minimum requirements in the Code.
2. The existing construction of the landing is within accepted tolerances, therefore, the second handrail is not necessary.
3. The handrail must be continuous throughout the entire length of the stair as required in Sentence 9.8.7.2.(2).

RULING

1. The Applicant

Mr. David Scott, Vice-President, Grand Shores Realty Development Corporation, Toronto, Ontario, has received a building permit under the Building Code Act, 1992 and is currently constructing a condominium building located at 2-4 Toronto Street, Barrie, Ontario.

2. Description of Construction

The Applicant is constructing a 16-storey residential condominium building. The structure has a Group C - residential occupancy classification and a building area of 1251 m^2. It is of noncombustible construction and equipped with a partial sprinkler system. In addition, the building is provided with a fire alarm system and a standpipe and hose system.

The construction in dispute involves the proposed changes to the design of the exterior walls of the residential units. The changes include the reconfiguration of one-hour rated fire walls that would separate two adjacent suits; a total of eight suits on each floor are affected.

The exterior fire walls separating adjoining units of the building are to be subtended at an angle of 90°, 135°, or 180°. It is the exposing unprotected openings of the exterior walls with a subtended angle of 90° which are the subject of this dispute. Under the proposed design, the exterior wall of the building is, when viewed in plan, to have a saw-tooth pattern. Specifically, in this configuration, the narrower wall of one suite will consist entirely of window (i.e., the ratio of total wall area to unprotected opening will be one to one (1:1)) and will be set at 90^0 to the adjacent wall of the next door suite. The adjacent wall, on the other hand, will have a window constituting 38 percent of the wall (i.e., the ratio of total wall area to the unprotected opening will be 2.6:1). The window on this wall is to be located 1,500 mm from the intersection point of two walls. As a result, the distance between two windows, as measured on the exterior of the building, will be 1,500 mm.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed construction of exterior walls and window locations, whereby an unprotected exterior wall/window opening is exposed to an unprotected exterior wall/window opening in another fire compartment, provides sufficiency of compliance with Sentence 3.2.3.13.(1) of the Ontario Building Code (OBC).

Sentence 3.2.3.13.(1) identifies the formula that calculates the required distance between unprotected openings of two exterior adjacent walls which are parallel or at an angle of less than 135° to one another. (This provision also stipulates that in no case is this distance permitted to be less than 1000 mm. In the current situation, however, the prescribed formula is applicable.) The formula mandates that the minimum distance between openings of exterior walls is a function of the greater of the two limiting distances required to be maintained between the exposed building faces and the angle between these two faces. The required distance for the exposing building faces in residential occupancies with unsprinklered fire compartments (here the adjacent suits) is set out in Table 3.2.3.1.A. When the distances from the Table are applied to the Sentence 3.2.3.13.(1) formula, the calculated required distance becomes 5 metres between the unprotected openings under dispute. As noted, the Applicant is proposing a distance of a 1,500 mm between two windows.

4. Provisions of the Ontario Building Code

Article 3.2.3.13. Wall Exposed to Another Wall

(1) Except as required by Sentences (3) and 3.2.3.12.(1) or as permitted by Sentence 3.2.3.18.(4), if an *unprotected opening* in an exterior wall of a *fire compartment* is exposed to an *unprotected opening* in the exterior wall of another *fire compartment*, and the planes of the 2 walls are parallel or at an angle less than 135˚, measured from the exterior of the *building*, the *unprotected openings* in the 2 *fire compartments* shall be separated by a distance not less than D◦ where D◦ = 2D - {(q/90) x D} but in no case less than 1 000 mm (3 ft 3 in), and

D = the greater required *limiting distance* for the *exposing building faces* of the 2 *fire compartments*, and
q = the angle made by the intersecting planes of the *exposing building faces* of the 2 *fire compartments* (in the case where the exterior walls are parallel and face each other, q = 0˚).

5. Applicant's Position

The Agent for the Applicant submitted that the method of calculation they have used to determine the exterior wall intersection angle and location of windows from suite to suite creates no greater hazard than if the exterior windows/walls intersected at an angle of 135°. The windows in adjoining suites are separated by a distance of at least 1,500 mm and the exterior walls in between are provided with a one hour fire resistance rating. In his opinion the radiant heat effect of fires between suites will be reduced by this proposed configuration. To construct in compliance with OBC requirements, in this instance, would provide less safety than the proposed design.

The Applicant stated, that this proposal complies with the intent of the Building Code despite a 90° wall intersection, "there are no unprotected openings beyond the line of 135 degrees, (the line to which the exterior walls could have intersected at and still be considered to not expose each other to thermal radiation). He suggested that , "(w)hen the two exterior walls intersect at an angle of 135 degrees or more, the two windows are not considered to be exposing each other and they can be right adjacent to each other." This, he argues, would be less safe than the proposal for which they are seeking approval, where the exposing windows are separated by a distance of at least 1,500 mm.

In summation, the Applicant submitted that, by adopting this method of calculation the intent of the Code is clearly maintained and there is no additional, unacceptable risk from fire spreading between compartments.

6. Respondent's Position

The Designate for the Respondent submitted that Article 3.2.3.13. does not allow this proposal as the subject walls intersect at a 90° angle. He argued that the Applicant was seeking approval of a design that "would result in an unprotected opening in one fire compartment to be exposed to an unprotected opening in another fire compartment without providing the minimum distance between openings." In terms of the subject building, the minimum distance has been calculated at 5 m, using the standard method of calculation.

The Designate submitted that the minimum distance has not been achieved when measuring the limiting distance at right angles to the exposing building face. In addition, the design of the structure could easily incorporate reductions in the unprotected openings that would comply with the OBC

requirements. He acknowledged that the residential suites had already been sold and suggested that, if the Commission did not rule that the proposal has sufficiency of compliance, the Applicant would have the option of exploring other alternatives such as providing shutters, to create protected openings, or sprinklering the units and windows.

In summation, the Designate reiterated that the proposed wall construction exposed to another wall does not comply with strict wording of the provisions set out in the Building Code.

7. Commission Ruling

It is the decision of the Building Code Commission that the proposed construction of exterior walls and the location of windows provides sufficiency of compliance with Sentence 3.2.3.13.(1) of the Ontario Building Code at the Toronto Street Condominium, 2-4 Toronto Street, Barrie, Ontario.

8. Reasons

i) The proposed window arrangements and one-hour fire rated exterior wall construction meet the intent of Sentence 3.2.3.13.(1) of the Ontario Building Code for a wall exposed to another wall.

ii) The unprotected wall openings are outside the 135° angle and, despite the wall intersection at a lesser degree, heat radiation resulting from a fire within one suite, where the exterior walls have a one hour fire-resistance rating, will pose no greater risk to another suite than would a configuration designed in accordance with OBC 3.2.3.13.(1).

Dated at Toronto this **5th** day in the month of **October** in the year **2000** for application number **2000-57**.

RULING

1. The Applicant

Mr. Christiaan Wingelaar, President, 762429 Ontario Inc., Waterloo, Ontario, has received an order to comply under the Building Code Act, 1992 to remedy certain alleged deficiencies at 694 Glasgow Street West, Kitchener, Ontario.

2. Description of Construction

The Applicant completed construction of a new, detached Group C - residential building three years ago. The dwelling is described as two stories in building height (plus a finished basement), 600 m2 in building area and is of combustible construction.

As part of the construction, the Applicant built three sets of access to egress stairs. All of the subject stairs were custom built of solid ash. Each stair has open treads, i.e., there are no risers and all of the stairs have carpeting applied to the upper surface of the treads. The design of the stairs was not on the original plan approved by the municipal building department. The present design was a revision made

during construction. (For the sake of clarity, each of the three sets of stairs will be referred to as stair A, B or C and each individual stair will be numbered commencing from the bottom.)

The main stair (referred to as stair A) is located on the ground floor in the front foyer at the centre of the house and leads to the basement. This stair, comprised of 16 risers and consisting of two curved flights separated by a nearly rectangular landing [considered stair number 6], is elliptical in shape when viewed in plan. The ten stairs [stair numbers 7 to 16] on the upper flight have straight nosings with a 35 mm (1 3/8 in) overhang and a uniform run of 270 mm (10 5/8 in) at the midpoint of the stair.

Four stairs on the lower flight [numbers 2 to 5] have forward curving nosings with a 35 mm (1 3/8 in) overhang and differing run lengths (measured at the midpoint) for each stair. The run length increases during descent, ranging from 292 mm (11 in) for the highest stair to 348 mm (13 11/16 in) for the lowest. There is a large, oval-shaped stair [number 1] at the bottom of the lower flight, however, since it has a run of approximately 930 mm (3 ft, 5/8 in) it is considered as a second landing. All stairs have an inside run of 203 mm (7 15/16 in). As well, this stair has a uniform stair rise of 189 mm (7 7/16 in) and has been provided with handrails on both sides throughout its entire length.

The second stair (stair B), located on the west side of the house, has a total of 15 risers and is a secondary stair that also leads from the main floor to the basement. This stair, starting from the top, has a straight run of seven steps [stairs 15 to 9] and then turns 450 to the right between stairs 7 and 6. Whereas the stairwell itself is comprised of straight walls with a precise 450 turn, stairs 8 through 5, however, have been designed to negotiate this change of direction in a gradual fashion.

The upper stairs [down to and including stair 9] have a run of 208 mm (8 3/16 in). Stairs 8, 7, 6, and 5 have runs at their midpoints of 212 mm (8 3/8 in), 247 mm (9 3/4 in), 305 mm (12 in) and 212 mm (8 3/8 in) respectively. (The minimum runs on the inside of the stair also vary, but with the smallest being 162 mm (6 3/8 in) they all exceed the OBC's minimum inside run requirement of 150 mm (5 7/8 in).) The run lengths for stairs 4, 3 and 2 are all 208 mm (8 3/16 in). The bottom stair is similar in design to the lowest stair in stair A, and it too has such a long run, at 1,000 mm (3 ft, 3 in), that it is considered as

a landing. This stair has a uniform rise of 190 mm (7 in) and each stair has a 35 mm (1 3/8 in) nosing. There is a continuous handrail on the left side (when descending) and a second handrail on the right side, but only on the lower portion after the 450 turn.

Stair C, leading from the main floor to a room above the garage area, is located directly above stair B and as a result navigates the same 450 right turn. This stair, however, is divided into two flights and provides a landing at the turn. There are a total of 14 risers, each measured at 186 mm (7 5/16 in). The upper flight has 9 stairs [numbers 14 to 6], each with a consistent run of 212 mm (8 3/8 in). The landing [considered stair number 5] has an irregular shape and is curved on the inside and has straight walls (with the 450 turn) on the outside. It does not, however, provide the full 450 rotation throughout its turn.

The remainder of this turn, approximately 5 to 100, has been built into the remaining four stairs [4 to 1] of the lower flight, which are contained within a straight stairwell (as articulated by the handrail on the inside and the opposing wall on the outside). To achieve this turn, these stairs are similar in design to curved stairs with narrower runs on the inside. All inside runs exceed the minimum requirement of 150 mm (5 7/8 in) as set out in the OBC, and despite the difference in shape between each of these stairs, the midpoint run length is consistent at 212 mm (8 3/8 in). Stair C has a single handrail on the inside and the tread nosing is uniform at 35 mm (1 3/8 in).

The construction in dispute involves the lower flight of stair A, stairs 5, 6, 7 and 8 of stair B and the lower flight of stair C.

3. Dispute

The dispute between the Applicant and the Respondent is whether the three as-built separate and irregular stairs, specifically the lower flight of stair A, stairs 5, 6, 7 and 8 of stair B and the lower flight of stair C, provide sufficiency of compliance with Sentences 9.8.2.1.(1) and 9.8.3.1.(1) and Article 9.8.5.2. of the 1990 Ontario Building Code. The first provision stipulates that all treads and risers must have a uniform run and rise within each flight of a stair. While the riser height is uniform in all three sets of stairs, the runs, in the portion of the stairs identified, vary.

Article 9.8.5.2., the last provision, governs minimum and maximum dimensions for the run and rise of curved stairs not serving as exit stairs. According to this provision the average run for such stairs must be at least 200 mm and the minimum run at least 150 mm. Although the average stair runs are not consistent, they appear to fall within the dimensions set out in Article 9.8.5.2. As well, there seems to be no issue concerning minimum run.

In terms of the standards for risers, OBC 9.8.5.2. states that they must conform to those set out in Article 9.8.3.1. Sentence (1) of this provision limits stairs on the interior and exterior of a dwelling unit to a maximum rise of 200 mm. The riser heights are different between each of the stairs A, B and C, but, as indicated, are consistent within each stair. Based on information submitted by the Applicant (stair A - 189 mm, stair B - 190 mm, stair C - 186 mm), it appears that all risers are less than 200 mm.

Other OBC provisions have been cited by the parties as also being a matter of dispute. In the opinion of the Commission, however, these articles are not relevant. For example, Articles 9.8.5.1., which deals with curved stairs in exits, and 9.9.2.9., which requires exit or access to exit stair nosings to be at right angles to the direction of travel, are not applicable because these are not exit nor access to stairs as envisaged in the Code. All three are egress stairs. Moreover, the Commission does not consider the subject stairs as containing winders. It views the intended design of each stair as a curved stair that has been constructed in stairwells that contain straight demising walls. As a result, the provisions of the OBC relating to winders such as Article 9.8.5.3. do not apply.

At issue, therefore, is whether the irregular stair runs sufficiently comply with the OBC stair requirements for uniformity.

4. Provisions of the Ontario Building Code

Sentence 9.8.2.1. Uniform Treads and Risers

(1) Treads and risers shall have uniform rise and run in any one flight.

Sentence 9.8.3.1. Rise and Run of Stairs

(1) Except for stairs to areas used only as service rooms, interior stair within dwelling units and exterior stairs within dwelling units and exterior stairs serving dwelling units shall have a maximum rise

of 200 mm (7 7/8 in), a minimum run of 210 mm (8 1/4 in) and a minimum tread width of 235 mm (9 1/4 in).

Article 9.8.5.2. Curved Stairs not in Exits

Except as permitted in Article 9.8.5.3., a curved stair not required as an exit shall have an average run of not less than 200 mm (77/8 in) and a minimum run of 150 mm (57/8 in) and shall have risers conforming to Article 9.8.3.1.

5. Applicant's Position

At the outset, the Applicant stated that the current stair design was a revision to the original approved plan. He explained that stairs A and B, both leading to the basement, had to be modified because the level of the basement floor was made lower during construction. And as a consequence of maintaining adequate headroom on the modified stair B, stair C above it also had to be changed. The net result for all three stairs was that two additional risers were added to each, yet the stair openings remained the same size. Since the stairs had to be redesigned, further revisions were made to enhance their aesthetic appeal, the Applicant stated.

The Agent for the Applicant then acknowledged that the changes to the stairs were done without consultation nor approval of the Building Department. Nevertheless, he submitted that the stairs in dispute are a high quality custom built product made by a master stair builder. He argued that despite the alterations to the approved stairs, the as-built ones "provide safe and comfortable travel in both directions and do not constitute a hazard to any user." The Agent asserted that while the stairs may not meet all the prescriptive requirements of the OBC, they certainly meet the intent of the various safety standards.

By way of general comments, the Agent noted that all of the individual steps within the three sets of stairs adhere to the minimum and maximum rise and run criteria found in the Code. And while the average run (measured at the midpoint of the stair width) is not consistent in the disputed areas, the stair runs are uniform within each flight at what he described as the "walking line". The walking line, he explained, is where a person would actually walk on the stairs and is located 305 mm (12 in) from the

inside handrail. As a concept, the walking line makes more ergonomic sense than the Code's average run because users almost never walk down the middle of a stair. Providing uniformity at the walking line, he argued, makes the subject stairs safer.

Turning specifically to each set of stairs, the Agent asserted that the lower flight of stair A, with its stair runs increasing in length as one descends, incorporates another ergonomic design principle: deceleration. As he indicated, slightly longer runs during descent of a stair provides more generous step sizes that are better able to allow descending users to slow down, if necessary. The large bottom step, which is more akin to a landing, is the culmination of the decelerator principle. He added that the outward curved nosings of these stairs does not reduce its performance in terms of uniformity in the walking line and providing for deceleration.

In the case of stair B, the Agent described the lower portion as a curved stair in a stairwell with straight walls. As a result, in his view, the disputed stairs (5, 6, 7 and 8), should not be regarded as winders, nor regulated as such. He noted that as curved stairs they meet the Code's dimensional rise and run criteria. And while stairs 5, 6, 7 and 8 are not consistent with each other in terms of average run, they too are uniform at the walking line. The Applicant offered to improve the negotiability of the stair by modifying the outside handrail so that it follows the intended curve of the stair instead of the straight lines articulated by its demising walls. He also proposed to continue the inner handrail on through the upper portion to the top of the stair. With the extensive run of the bottom stair (1)/landing, the decelerator principle has been incorporated into the design of stair B as well, the Agent noted.

Regarding stair C, the Agent indicated that the walking line principle has also been employed in its design. As a result, the lower flight has a uniform run measured at 305 mm from the inside handrail. The Agent reiterated the arguments concerning the benefits of the walking line principle with respect to stair C.

In conclusion, the Agent stated that while they may not comply fully with all of the prescriptive requirements of the OBC, the finished stairs have not compromised the safety of the users. This was

supported by the homeowner, who stated that in the three years since the stairs have been built they and their many guests have used them without incident. Lastly, the Applicant stated that extensive modification at this point would be very disruptive in terms of using the house and would be costly. He expressed hope that the Commission would allow the as-constructed stairs to remain.

6. Respondent's Position

The Respondent submitted that since, in his view, stair A or B and stair C "serve as a required means of egress and are considered as access to an exit, their designs must fully comply with requirements of Sections 9.8 and 9.9, respectively." He then listed the following as, in his view, the deficiencies or potential deficiencies of the subject stairs.

Assuming that stair A is a curved access to exit stair, the lower portion has steps that do not radiate from a common point, the Respondent stated. This situation, he noted, does not comply with Article 9.8.5.1. Or, if it were assumed that these stairs represent a winder, then they would violate the requirement in Article 9.8.5.3., specifically Sentence (1) that requires winders to turn 300. Moreover, as a winder, the stairs of the lower flight have elliptical shaped nosings which contravenes Article 9.9.2.9. Regardless of whether they are curved stairs or winders, their runs are irregular and do not comply with Subclause 9.8.5.1.(2)(c)(iii), he argued.

Regarding stair B (assuming for the sake of discussion that this and not Stair A is the access to exit stair), the Respondent stated that he does not believe it is a curved stair because the curving steps do not radiate from a common point, and like stair A it has a "floating reference point". Instead, he views it as having a winder, specifically at stair # 6. As a winder however, stair # 6 does not rotate 300 and therefore does not comply with OBC 9.8.5.3.(1). The requirement in Article 9.9.2.9. that the nosings of stairs be at right angles to the direction of travel is also not satisfied. As well, this stair lacks a uniform run stipulated as per Subclause 9.8.5.1.(2)(c)(iii).

As for stair C, the Respondent offered the same arguments as he did for stair B.

In summation, the Respondent stated that the stairs are well built and would be difficult to modify now. Nevertheless, he felt that he had little choice under the Code but to reject their design. Lastly, he stated that he hoped the Commission decision would clarify some of the provisions of the Building Code in dispute.

7. Commission Ruling

It is the decision of the Building Code Commission that the three separate and irregular stairs, specifically the lower flight of stair A, stairs 5, 6, 7 and 8 of stair B and the lower flight of stair C, provide sufficiency of compliance with Sentences 9.8.2.1.(1) and 9.8.3.1.(1) and Article 9.8.5.2. of the 1990 Ontario Building Code at 684 Glasgow Street West, Kitchener, Ontario on condition that:

a) A second handrail is installed in the lower flight of "stair C";

b) Signs are posted at the top and bottom of the disputed stairs ("stairs A, B and C") warning users of their irregularity; and,

c) The existence of irregular stairs in the dwelling and the requirement to maintain the above referenced warning signs as long as the stairs exist are registered on title of the subject property.

8. Reasons

a) The home has been occupied for three plus years without problems associated with the stairs and there have been no relevant insurance related claims submitted.

b) The average run is uniform at the "walking line" (305 mm from the inside handrail).

c) The stairs will be equipped with handrails on both sides of the disputed flights.

d) The stairs are provided with more than adequate lighting.

e) The required signage will provide warning to infrequent or first time users of the stairs.

RULING

1. **The Applicant**

   Mr. Warren Brent, Brent Systems Ltd., Port Carling, Ontario, has applied for a building permit under the *Building Code Act, 1992*, to construct a as-constructed sewage system at the Wells Cottage, Lot 27, Concession 8, Sub-lot 6, Plan 42R-9075, Seguin/Humphrey Township, Ontario.

2. **Description of Constrution**

   The Applicant has recently installed a new Class 4 fully raised septic system to serve a newly constructed Group C occupancy. The building is described as a two storey, detached structure and will be used as a seasonal dwelling. The building contains four bedrooms, 21.5 fixture units and has total finished area of 236 m^2. The calculated daily design sewage flow is 2400 L/day and the water supply for the building is provided by a drilled well.

   The site is a 2.7 ha cottage property located on Lake Joseph that is covered with brush and some hardwood and pine trees. It has a moderate five to 15° slope that covers most of the lot, including where the cottage sits and all of the portion to the rear, or roadside, of the building. In front of the cottage, at the lakeside, there is a steep 45° slope to the water. A substantial, large granite

boulder retaining wall was constructed in front of the cottage to stabilize the steep slope in that area. The soil at the site is thin with the depth to bedrock being only 0.33 m. The profile of the natural soils on the property is silty brown sand with a percolation time of 14 min/cm.

The as-installed septic system includes a 5000 L plastic septic tank, a pump chamber with pump, and a 35 m^2 fully raised sand filter bed consisting of 4 runs located at 1.2 m on centres and mantle. The septic tank, installed on the lakeside of the cottage between the building and retaining wall, will receive sewage by means of gravity disposal from the dwelling. When the effluent reaches the pump chamber it will be pumped uphill to the filter bed located approximately 50 m away to the rear of the cottage.

The construction in dispute involves the clearance distance between one corner of the septic tank and a corner of the building located in the facade facing the lake. The clearance distance from the septic tank to the structure at this point is 0.76 m. (The corner in the building is created by a set back in the lakeside wall of the structure. Without this set back, the 0.76 m clearance distance would continue along the entire building-facing length of the septic tank.)

3. **Dispute**

The dispute between the Applicant and the Respondent is whether the as-constructed sewage system, with a clearance of only 0.76 m between the nearest point of the septic tank and the foundation wall of the building, provides sufficiency of compliance with Sentence 8.2.1.6.(1) of the OBC.

This provision sets out the clearance distances required between the treatment unit component of a Class 4 or 5 septic system and structural or environmental foundations. According to this provision, the minimum horizontal clearance distance, as set out in Table 8.2.1.6.A., between a treatment unit, in this case a septic tank, and a building, i.e., the "structure", must be at least 1.5 m. The subject septic tank has a clearance distance of only 0.76 m at its nearest point to the foundation wall of the building.

4. **Provision of the Building Code**

Sentence 8.2.1.6. - Clearances for a Class 4 or 5 Sewage System

1. Except as provided in Sentences 8.2.1.4.(1) and (2), a treatment unit shall not be located closer than the minimum horizontal distances as set out in Table 8.2.1.6.A.

5. **Applicant's Position**

The Agent for the Applicant submitted that the as-installed septic tank provides sufficiency of compliance with Sentence 8.2.1.6.(1) of the Code.

The Agent acknowledged that the placement of the tank, at 0.76 m from the cottage, does not meet the minimum clearance distances set out in table 8.2.1.6.A. He explained, however, that this discrepancy was caused by construction difficulties experienced at the site. Specifically, he mentioned that underlying bedrock meant that blasting would be necessary to position the tank 1.5 m away from the cottage. (This is why it was not possible to rotate the tank as the Respondent suggested.) Nevertheless, blasting was impossible at the time since both the cottage and retaining wall had already been built when the sewage system installation occurred.

The Agent then argued that the subject installation was acceptable. He noted that from a structural standpoint neither the building nor the retaining wall would be adversely affected. In fact, due to the sound construction methods of these structures they do not rely on the infill sand for lateral support. (The entire cottage and retaining wall area was excavated down to bedrock and was backfilled with clean sand.) The cottage foundations are especially strong, he continued. It consists of a poured concrete footing pinned to the bedrock with seven courses of 250 mm concrete block reinforced internally with steel wire and core filled concrete and externally with clean compacted sand on both sides of the foundation wall.

The Agent also argued that the tank installation was environmentally safe. He pointed out that apart from the proximity to the building, the system's construction met Code. Further, he noted that the tank was placed in new, clean sand fill, thereby protecting the tank from the underlying bedrock. In addition, there is no weeping tile located along the entire front of the building where the tank is placed. As such, no effluent can migrate into the stormwater system.

Lastly, the Agent noted that the tank, in his view, could easily be maintained or even replaced without problem.

For these reasons, the Agent concluded that the present tank installation posed "no risk of structural or environmental damage" to the building, the retaining wall, the property or its vicinity.

6. **Respondent's Position**

The Respondent submitted that the as-installed septic tank, situated only 0.76 m away from the cottage, does not comply with the 1.5 m minimum setback requirement as determined in the OBC.

By way of background, the Respondent noted that a 1.5 m separation was shown on the plans submitted for approval. During an inspection, however, she discovered that the tank was too close. She suggested at the time that by placing the tank at an angle to the building it might be possible to provide the required separation.

The Respondent then stated that the Code "outlines 'minimum' clearances and does not allow discrepancy for new construction".

She concluded by indicating that she does not have the authority to waive OBC requirements and allow a reduced clearance distance due to the construction difficulties encountered by the Applicant.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the as-constructed sewage system, with a clearance of only 0.76 m between the nearest point of the septic tank and the foundation wall of the building, provides sufficiency of compliance with Sentence 8.2.1.6.(1) of the Ontario Building Code.

8. **Reasons**

a) The elevation of the septic tank with respect to the lowest floor level in the building is such that potential for structural and environmental damage is reduced.

b) The foundation of the cottage is sound.

c) Maintenance or replacement of the tank will not be a problem.

d) The Commission is of the opinion that the subject installation will not cause environmental or structural damage to the building or surrounding area.

RULING

1. **The Applicant**

   Mr. Joe Goodbaum, representing Clearnet Communications of Scarborough, Ontario, has applied for a building permit under the *Building Code Act, 1992*, to construct a kiosk structure at Masonville Place Mall, 1680 Richmond St. N, London, Ontario.

2. **Description of Constrution**

   The Applicant is proposing to construct a kiosk as a phone retail outlet in one of the public corridors serving the second floor of Masonville Place Mall located in London, Ontario. The newly renovated mall is classified as having a Group-E mercantile major occupancy. The mall is 81 641 m^2 in building area, two storeys in building height, of non-combustible construction, and equipped with sprinkler and fire alarm systems.

   The proposed kiosk will have an overall area of 13.5 m^2 (3m by 4.5m). It will be constructed in the middle of a 9 m wide public corridor which connects the north-west wing of the Masonville Place Mall with its south-west wing.

The kiosk's structure, as proposed by the applicant, consists of a 1.2 m^2 (2m by 0.6m) central island containing a cash area in order to incorporate two cashier counters. It will also include two L-shape counter assemblies (that will surround the central island) each comprised of five connected cabinets to be used as accessory showcases and phone counters. The L-shape counters are .45 m in width and will be arranged so that the long and short portions run parallel to each other. The counters will be placed far enough apart to allow an opening to the interior area at the north-west and south-east corners. The distance between central island and surrounding cabinetry will be 810 mm. The width of each entrance opening will be 651 mm. The clearance distance between the exterior boundaries of the kiosk on both east and west sides and the adjacent shops will be 3m.

The construction in dispute involves the design of the subject kiosk which, as proposed, does not provide a barrier-free path of travel within the kiosk area and does not meet the minimum width requirements mandated by the Ontario Building Code (OBC) for barrier-free entrances and corridors.

3. **Dispute**

The dispute between the Applicant and the Respondent is whether the proposed 3 m by 4.5 m kiosk structure, located in a 9 m wide public corridor, is required to provide barrier-free accessibility in accordance with Sentences 3.8.2.1.(1) and 3.8.1.3.(1) of the Ontario Building Code.

The first provision, Sentence 3.8.2.1.(1), defines areas where a barrier-free path of travel is required based on the type of occupancy. According to this provision, except where essential obstructions that would exist in the "work areas" that would make a barrier-free path of travel dangerous, and except for provisions of Sentences (2), (3), and (4) of the same Article that provide lists of spaces and occupancies which are exempted from the provision of barrier-free paths of travel, all entrance storeys and occupied floor areas equipped with a passenger elevating device that are required to have barrier-free entrances are also required to provide barrier-free paths of travel. The exceptions defined and listed in Sentences 3.8.2.1.(1), (2), (3), and (4) do not apply to kiosks.

Thus, if an area is deemed to require a barrier-free path of travel then certain construction requirements apply. Among these is Sentence 3.8.1.3.(1) which stipulates that a barrier-free path

of travel must have an unobstructed width of at least 1060 mm for the passage of mobility challenged people. The kiosk will be located in a 9 m wide public corridor. Keeping the structural parameters of the kiosk as proposed by the applicant means any increase in the width of the interior corridor of the kiosk will affect the width of the public corridor where the kiosk is located (Sentence 3.3.1.9.(6)(a) of the OBC requires a public corridor under such circumstances to have "an unobstructed width of not less than 3 m at all times adjacent and parallel to all rooms and suites that front onto" it). Thus, increasing the internal dimensions of the kiosk would either violate Clause 3.3.1.9.(6)(a) or require the reduction in the dimensions of the kiosk cabinetry.

Therefore, the specific issue before the Commission is whether under the Ontario Building Code the proposed kiosk is required to be barrier-free and meet minimum width requirements for barrier-free paths of travel.

4. **Provision of the Building Code**

Sentence 3.8.1.3.(1) - Barrier-Free Path of Travel

1. Except as required in Sentence (4) and except as permitted in Subsection 3.8.3., every barrier-free path of travel shall provide an unobstructed width of at least 1 060 mm (3 ft 6 in) for the passage of wheelchairs.

Sentence 3.8.2.1.(1) - Areas Requiring Barrier-Free Path of Travel

2. Except where essential obstructions in the work area would make a barrier-free path of travel hazardous, and except as provided in Sentences (2), (3) and (4), a barrier-free path of travel from the entrances required by Sentences 3.8.1.2.(1) and (2) to be barrier-free shall be provided throughout the entrance storey and within all normally occupied floor areas served by a passenger type elevator or other platform equipped passenger elevating device.

5. **Applicant's Position**

The Agent for the Applicant submitted that the minimum width requirement to make the interior corridor of the proposed kiosk barrier-free "conflicts with the fire safety requirements of a 10' [3

m] wide corridor clearance which bounds the kiosk on either side and restricts the kiosk expansion beyond the allocated boundary."

The Agent argued that providing a barrier-free path of travel within the kiosk area would cause them to increase width of the interior corridor by 250 mm [from 810 mm to 1060 mm]. He added that this expansion, which could only benefit one disabled person at a time, will affect the width of the public corridor that serves many people at all times.

Regarding the Respondent's proposals, the Agent argued that the relocation of the centre island (cashier counters) is not feasible for security reasons and decreasing the width of the cabinetry will make them too narrow and operationally unuseable.

The Agent stated that the requirement of the minimum corridor clearance of 3 m on either side of the kiosk is for fire safety reasons. Thus, they believe in this particular case that the fire safety concerns that will affect many people should take precedence over the "general welfare" of one individual and they should be allowed to proceed with their construction.

6. **Respondent's Position**

The Respondent chose not to attend the hearing. The commission, therefore, relied only upon his written submission.

The Respondent submitted that in order for a building permit to be issued, the Applicant must verify that the proposed kiosk will not interfere with the minimum width of the mall corridor and also ensure other relevant sections of the OBC (in this case barrier-free accessibility) are complied with. He argued that the interior floor surface within the proposed kiosk does not meet the minimum width requirement of 1060 mm for barrier-free accessibility as specified in Sentence 3.8.1.3.(1). For this width to be met without interfering with the width of the public corridor, the Respondent has proposed that the Applicant consider one of the following options:

(1) To remove the centre island,

(2) To reduce the size of the cabinetry (perimeter units and centre island) in order to provide the required 1060 mm clearance, or

(3) To relocate the kiosk to another location within the mall which would have a corridor width with a minimum dimension of 9708 mm (31'-10") and would allow the kiosk with the present fixture sizes to be expanded to 3708 mm without interfering with the minimum clear corridor width of 3 m (9'-10") (OBC 3.3.1.9.(6).(a)) on each side of the kiosk .

7. **Commission Ruling**

It is the decision of the Building Code Commission that the proposed 3 m by 4.5 m kiosk structure, located in a 9 m wide public corridor is required to provide barrier-free accessibility in accordance with Sentence 3.8.1.3.(1) and 3.8.2.1.(1) of the Ontario Building Code at the Clearnet Kiosk, Masonville Place Mall, 1680 Richmond Street North, London, Ontario.

8. **Reasons**

Kiosks are not listed as one of the areas in terms of providing a barrier-free path of travel as determined in Article 3.8.2.1., therefore a barrier-free path of travel of the appropriate width is required.

RULING

1. **The Applicant**

   Mr. Patrick Corvetti, Director of Store Planning, Grafton-Fraser Inc., Toronto, Ontario, has received an order to comply under the *Building Code Act, 1992,* to remedy certain alleged deficiencies at a retail clothing store known as the Suit Exchange at Colossus, located at 7601 Weston Road, Unit 102, Woodbridge, Ontario.

2. **Description of Constrution**

   The Applicant has recently constructed a Group E - (clothing) mercantile occupancy in a retail plaza described as one storey in building height and 4,747 m^2 in building area. The subject suite has an approximate area of 530 m^2, with dimensions of roughly 11 by 48 m. The building is constructed of noncombustible materials and is equipped with a sprinkler system, but not a standpipe and hose system nor a fire alarm system.

   The retail suite is provided with two separate doors, one at the front and one at the rear. The front exit door is the principal entrance used by customers and staff. The door at the rear accesses an

interior public corridor that runs behind the clothing store that serves as a service lane. This door is used as a shipping and receiving area.

The construction in dispute involves the installation of a second door on the interior side of the rear access to exit door. This door is described as a vertical, rolling security grill that measures approximately 1.2 by 2.1 m. It is manually opened and closed by a chain mechanism and is equipped with a keyed locking device.

The Applicant installed the roll-down door to enhance the security of the premises.

3. **Dispute**

The dispute between the Applicant and the Respondent is whether the as-installed roll down security door that is closed only during non-business hours provides sufficiency of compliance with Sentences 3.3.1.10.(1) and 3.3.1.12.(2) of the Ontario Building Code. Sentence 3.3.1.10.(1) requires (with limited exceptions which are not applicable in this case) that access to exit doors must swing on a vertical axis. As a roll-down device, this door does not operate by swinging on a vertical axis. The latter provision, Sentence 3.3.1.12.(2), requires that a door in an access to exit be readily openable without requiring keys or any specialized knowledge to open it. The subject door requires both keys and specialized knowledge to operate.

Since the roll-down security door does not meet these provisions, the issue in dispute, therefore, is whether there are adequate measures provided in the suite to compensate for the reduction in performance of the rear access to exit door.

4. **Provision of the Building Code**

Sentence 3.3.1.10. - Door Swing

1. Except as permitted by Article 3.3.1.11., a door that opens into a corridor or other facility providing access to exit from a suite, or a room not located within a suite, shall swing on a vertical axis.

Sentence 3.3.1.12. - Doors and Door Hardware

2. ,

3. A door in an access to exit shall be readily openable in travelling to an exit without requiring keys, special devices or specialized knowledge of the door opening mechanism, except that this requirement does not apply to a door serving a contained use area, or an impeded egress zone, provided the locking devices conform to Sentence (6).

5. **Applicant's Position**

The Applicant submitted that the roll-down security door provides sufficiency of compliance with Sentences 3.3.1.10.(1) and 3.3.1.12.(2) of the building code because the door is always open during business hours and when anyone is in the store. As a result, the door cannot pose a hazard to any occupants due to the fact that no one will be inside when the door is shut. He noted that the door is even open when the overnight security guard inspects the premises. Further, there is no concern about night cleaning staff because the store is cleaned immediately after closing by sales staff, during which the subject door is still open.

The Applicant indicated that he hoped there could be a way to retain the present roll-down door and still comply with the Code. He indicated that safety was their highest concern, but that they would like to achieve a certain level of security as well. The door, he argued, was necessary to enhance the security of the store, which sells high-end men's clothing. He stated that the door would be extremely valuable in preventing the type of theft they have experienced at some of their other locations. As a secondary barrier to entry, the roll-down door would delay thieves from gaining entry into the store until the police would have a chance to respond, he argued.

6. **Respondent's Position**

The Respondent submitted that the subject suite is large enough that two Code complying exits are required. He stated that Sentence 3.3.1.10.(1), which requires that a door into an access to exit shall swing on a vertical axis, and Sentence 3.3.1.13.(2), which requires a door in an access to exit be readily openable without requiring keys, special devices or special knowledge, are applicable and must therefore be met. He argued that the current situation did not meet these provisions.

In the Respondent's view, the installation of the steel shutter door creates a hazardous situation by erecting a physical barrier blocking the exit. He also expressed concern about the fact that the subject door significantly complicates what would normally be a passive life safety (exit) system with an active device that relies on additional mechanical elements and on human behaviour to open and shut the door at the appropriate times. The roll down door, as the Respondent indicated, certainly requires keys and specialized knowledge to operate.

The Respondent also argued that the combustible load was high due to the nature of the retail operation.

Lastly, the Respondent asked that if banks and other higher risk businesses can achieve a good level of security as well as comply with the Code, why not this facility? He concluded by stating that if the Commission were to approve this door it would send out the wrong message to users of the OBC.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the as-installed roll-down security door that is closed only during non-business hours does not provide sufficiency of compliance with Sentences 3.3.1.10.(1) and 3.3.1.12.(2) of the Ontario Building Code at Grafton-Fraser Inc., Suit Exchange at Colossus, 7601 Weston Road, Unit 102, Woodbridge (Vaughan), Ontario.

8. **Reasons**

a) The roll-down door does not comply with Sentences 3.3.1.10.(1) and 3.3.1.12.(2) in that it does not swing on a vertical axis and it requires keys and special knowledge to operate.
b) Sufficiency of compliance was not demonstrated.
c) Other alternatives are available.

Dated at **Toronto** this **2nd** day in the month of **March**, in the year **2000**, for application number **1999-89**.

RULING

1. **The Applicant**

   Mr. Doug Dean, President, Bricker Building Ltd., Oakville, Ontario, has received a building permit under the *Building Code Act, 1992,* to construct a single detached dwelling at 76 Chancery Lane, Oakville, Ontario.

2. **Description of Constrution**

   The Applicant has recently constructed a Group C residential building which is described as two storeys in building height and 313.2 m^2 in building area.

   The construction in dispute involves the wrought iron guards installed on both sides of the stairs leading to the second floor and in the open second floor hallway. The Applicant, upon request of the home owner, has used a customized, decorative design for the subject guards. The guard contains two distinct patterns. The predominant one consists of a scroll design that is repeated in sections measuring approximately 1.22 m in width. (There is apparently no space in between the scrolling metal members that would accommodate a spherical object 100 mm in diameter.) Separating the scroll panels are a series of vertical 13 mm thick cylindrical balusters each with

several sets of decorative cast iron knobs. These knobs extend the picket's width by 9 mm on each side, thereby increasing its total width at these locations to 31 mm. The decorative knobs are placed in an alternating pattern on each picket, and thus the protrusions on each picket caused by the knobs do not coincide with the knobs on adjacent pickets on a horizontal level.

Both the scrolling pattern and the balusters are supported throughout the entire length of the guard by a bottom and top rail, which runs below and parallel to the handrail. On the horizontal surfaces, the bottom rail is located below 100 mm in height, as measured from the walking surface. The top (supporting) rail is roughly 800 mm in height. (The handrail is measured at 900 mm to its top.) On the stairs, the rail at the bottom forms one side of a triangle with the stair tread and riser comprising the other two sides. These openings are large enough to insert a 146 mm diameter spherical object.

3. **Dispute**

The issue at dispute between the Applicant and the Respondent is wether the as-installed ornamental metal guards and rails, that include pickets ranging in thickness from 13 mm to 31 mm and sections of scroll pattern, and that have triangular openings (large enough to insert a spherical object 100 mm in diameter) formed by the stair tread and riser and the bottom cord of the railing provides sufficiency of compliance with Article 9.8.8.5. and Sentence 9.8.8.4.(1) respectively of the Ontario Building Code.

The former provision stipulates that guards must not be designed in such a way as to facilitate climbing between 100 mm and 900 mm above the floor level. At issue, therefore, is whether the design of the guard facilitates climbing within this range. Among the specific aspects of the guard's design that must be examined in order to address this question is whether the scroll pattern within the subject guard produces a ladder effect that could facilitate climbing and whether the 9 mm protrusion on the pickets also contributes to their climbability.

Sentence 9.8.8.4.(1), regulates the size of openings in required guards. According to this provision the size of the guard openings must be small enough to prevent passage of a spherical object having a diameter of more than 100 mm, unless such openings can be shown that they are not a hazard. Since the subject triangular openings permit the passage of a 146 mm sphere the issue to be determined is whether they represent a hazard.

4. **Provision of the Building Code**

Sentence 9.8.8.4.(1) - Openings in Guards

1. Except as provided in sentence (2), openings through any guard which is required by Article 9.8.8.1. shall be of a size which will prevent the passage of a spherical object having a diameter of more than 100 mm (4 in) unles sit can be shown tha tthe location and size of penings which exceed this limit do not represent a hazard. (See A-9.8.8.4.(1) and (2) in Appendix A.)

Article 9.8.8.5. - Design to Prevent Climbing

2. Guards required by Article 9.8.8.1. and serving buildingsof residential occupancy shall be designed so that no member, attachment or opening located between 100 mm (4 in) and 900 mm (2 ft 11 in) above the floor or walking surface protected by the guard will facilitate climbing.

5. **Applicant's Position**

At the outset the Applicant offered an explanation as to how the disputes arose. In his opinion, he felt that there had been an understanding reached between himself and the building inspector regarding conformity of the guard (which the homeowners had a hand in designing). This agreement was based on an examination of a sample section prior to installation. During subsequent inspections, however, the Respondent then took the view that the guard was deficient.

On the issue of a climbability, the Applicant acknowledged that the sections containing the scrolling pattern could facilitate climbing. He offered that those areas could be covered with plexiglass. He submitted, however, that the vertical balusters with their ornamentation should not be considered as facilitating climbing. He argued that if the subject balusters were seen as climbable "then every tuned wood spindle with any type of contour along its shaft with any type of staggered pattern would then be in dispute".

The Applicant stated that some common sense was necessary when applying the Building Code. For example, he noted that on some stairs (including the present one) it is possible to climb all the way up on the outside of the railing by standing on the tread overhang or that a small child could fall through open risers in other stairs. However, these two issues which he argued could be more hazardous than balusters with ornamentation are not prevent by the Code.

Regarding the issue of the triangular opening, the Applicant submitted that the space looks larger than it actually is. He noted that any spherical objects with a diameter of 146 mm or less could fit in the triangular opening. Further, he argued that the location of the opening, tucked into the rigid confines of a right angle corner, make the space quite difficult for a child to actually get their head into. Moreover, the opening is made even less accessible due to the 18 mm thick carpet on the stairs.

For the above reasons, the Applicant concluded by stating that, in his view, the as-built guard and railing are not a hazard and provide sufficiency of compliance with the Ontario Building Code.

6. **Respondent's Position**

The Respondent submitted that the scrolling pattern is very tempting to climb and the balusters could also be climbed. Therefore, in his view, the guard does not conform with Sentence 9.8.8.4.(1). He stated that the climbability of the guard concerned him especially since the vertical drop is approximately 3 m. He also expressed concern about the proposal to put plexiglass on the guard since, as he argued, it could easily be removed and is not a permanent solution.

The Respondent also stated the triangular openings represent a hazard because they are large enough to insert a 146 mm in diameter spherical object, well in excess of the 100 mm maximum set out in Article 9.8.8.5.

Lastly, the Respondent stated that he hoped the Building Code Commission could offer the parties some guidance on these issues.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the as-installed ornamental guards and rails do not comply with Sentence 9.8.8.4.(1) and Article 9.8.8.5. of the Ontario Building Code at 76 Chancery Lane, Oakville, Ontario.

8. **Reasons**

a) The triangular openings on the stairs exceeds the 100 mm criteria.

b) The scroll pattern facilitates climbing.

c) The rail beneath and parallel to the top rail is within 900 mm of the walking surface.

Dated at **Toronto** this **17th** day in the month of **February**, in the year **2000**, for application number **2000-08**.

RULING

1. **The Applicant**

   Mr. Mike Godawa, Principal, Keen Engineering Co. Ltd., Toronto, Ontario, has received an order to comply under the *Building Code Act, 1992*, to remedy certain alleged deficiencies at the Southern Crop Protection and Food Research Centre, 93/95 Stone Road West, Guelph, Ontario.

2. **Description of Constrution**

   The Applicant has recently completed a partial renovation of, and construction of a new addition onto, an existing building known as the Southern Crop Protection and Food Research Centre. The addition is described as one storey in building height, approximately 9,796 m^2 in building area and is classified as a Group F, Division 2 occupancy. The building is of noncombustible construction and is equipped with a sprinkler system and a fire alarm system, but not a standpipe and hose system.

   The addition is intended as a research facility and has been designed to contain ten separate laboratory areas. Each laboratory is equipped with several plumbing fixtures. The entire new addition is leased by a single tenant, Agriculture and Agri-Food Canada. All laboratories are supervised by a single director of operations.

The construction in dispute involves the as-constructed acid waste vent system. This system, which is entirely separate from the sanitary drainage venting, has been designed and installed so that the ten laboratories are served by a venting network that terminates in four openings to the exterior. Thus, the four connections to the open air in the as-built acid waste vent system each serve multiple plumbing fixtures in multiple laboratory rooms.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the as-constructed acid vents serving plumbing fixtures of more than one laboratory room comply with Sentence 7.5.4.4.(1) of the OBC. According to this provision, vent piping serving a corrosive waste drainage system or dilution tank must extend separately to the open air. At issue is whether Sentence 7.5.4.4.(1) simply requires that the vents serving a corrosive waste drainage system be separate from the sanitary drainage venting, as is the case in the Southern Crop Protection and Food Research Centre, or whether each vent serving an acid waste plumbing fixture must extend independently of other such vents to the exterior.

4. **Provision of the Building Code**

Sentence 7.5.4.4.(1) - Venting of Corrosive Drain Piping and Dilution Tanks

1. Vents connecting to the corrosive drain piping or dilution tank shall extend independently to and terminate in open air.

5. **Applicant's Position**

The Agent for the Applicant submitted that his interpretation of Sentence 7.5.4.4.(1) is that it only requires that the acid waste venting system be separate from that of the sanitary drainage vents. He argued that the intent of this Code provision is to prevent corrosive fumes from entering the sanitary plumbing venting system, thereby eliminating a potentially hazardous mix of gases. In his opinion, this Sentence does not, in any way, require that each and every plumbing fixture designed to handle corrosive substances is to be separately vented to the

exterior from all other like vents. In fact, he argued that since the Code is silent on how many acid waste vents are required to extend to the exterior, it would be permissible to interconnect all corrosive plumbing fixtures to one single vent terminating in the open air.

To support his position, the Agent referenced a letter he received from the National Research Council's Canadian Codes Centre in Ottawa stating the intent of National Plumbing Code provision 5.5.3.(1), which is identical to OBC 7.5.4.4.(1). It states that "to prevent corrosive fumes from entering the sanitary venting system, vents serving corrosive drains, should be independent of sanitary venting system." It does not make any mention of extending the individual acid vents to the exterior, he noted. The Agent also quoted from a letter submitted to the Applicant by Peter Hughes, a Principal at Keen Engineering, the mechanical engineers for the project, which he indicated articulated their position well. Referring to the wording in Sentence 7.5.4.4.(1) the letter states:

"This means that acid vents, the word "vents" is plural not singular connected to drain piping (the word "piping" is plural not singular) indicates the entire system independent from the regular sanitary vent system [original emphasis] not each fixture vent shall terminate to open air.

"There is no way or has it ever to my knowledge meant taking each and every single vent from each and every fixture separately piped to atmosphere, just think about how ridiculous this would be if you had a multi-storeyed building with hundreds of fixtures, there would be a maze of vertical vent pipes looking like a salt shaker top building with the hundreds of vent pipes sticking through the roof [sic].

"If any building in North America has a [sic] acid waste vent system installed this way then the Engineers and building officials in my opinion would likely be open to legal action due to the additional costs that they have placed on the owner without justification or code requirements.

"An example of how wrong it is to interpret the code the way you have mentioned is as follows:

"If each fixture vent must be separate to the roof and atmosphere then why would not each fixture waste not be separate to the acid neutralizer chamber.

"I have been designing plumbing systems for over thirty years and have sat in so many plumbing code committees and plumbing task forces, never have I heard of such a [sic] interpretation.

"In conclusion the wording in the code is similar wording used in most North American codes and is meant to tell the designers that acid vent systems must be independently piped up to atmosphere and not connected to the regular sanitary vent system, that's all the wording means. Perhaps it's not a well-worded clause but there is no other meaning intended."

The Agent then focussed his arguments on the safety of the as-built acid venting system in the Southern Crop Protection and Food Research Centre. He argued the system is very safe primarily because the separation between the sanitary and corrosive plumbing venting systems, as required in Sentence 7.5.4.4.(1), has been achieved. The dilution tank is also separately vented. As a result, no volatile mixture of gases will occur between these systems.

Furthermore, he noted that in accordance with the Industrial Health and Safety Act there was a single director responsible for the entire facility, its staff and laboratory activities. The director's responsibilities include purchasing of all substances, monitoring the use of chemicals during experiments and disposal of waste products, including discharge into the plumbing fixtures. The Agent submitted a letter from this director indicating that due to the nature of the experiments conducted in the labs, the materials discharged into the corrosive fixtures will be compatible in vapour and liquid form and will thereby not create a hazardous condition. Thus, the Agent concluded by stating that the interconnecting of corrosive vents serving these subject labs will provide perfectly safe venting.

6. **Respondent's Position**

The Respondent submitted that Sentence 7.5.4.4.(1) of the OBC could be read that each trap serving every fixture requires separate and individual venting to exterior. However, as a Code provision, the Sentence, he noted, lacks clarity. As he explained, since Sentence 7.5.4.4.(1) was introduced into the OBC in its 1997 version, he and his colleagues have had some doubt as to its intent, specifically how it is to be applied. In an effort to gain an understanding of this issue, the building department obtained a verbal interpretation from the Ontario Plumbing Inspectors Association in 1998. The interpretation of that body was that "each trap serving a fixture, which handles corrosive waste, was to be individually vented to the open air."

The Respondent also indicated that previous correspondence with the technical staff in the Ministry's Housing Development and Buildings Branch supported a similar view in that all fixture traps in a single lab may, under the right conditions, be safely interconnected. Moreover,

any interconnection between separate labs depends on good design, good engineering practice and appropriate supervised use.

For these reasons, and because of past experience with other labs, the municipality took the position that they were prepared to accept that all the fixtures in a single lab could be collectively vented. However, interconnecting venting among different labs creates a hazardous situation due to the fact that scientists in different rooms will have little idea what is being poured into a sink in another lab. The municipality, the Respondent noted, does not have the authority nor the staff and expertise to control what chemicals are used and how they are mixed. In fact, they have no control over the operation of the building. Their responsibility ends with occupancy. And if a lab were to be leased to another similar tenant there would be no change of use triggered. Because of this, the Respondent argued that he would prefer to see a passive life safety system built under the OBC, i.e. adequate venting to the exterior, that does not rely on regulating the behaviour of individuals now and into the future.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the acid vents serving plumbing fixtures of more than one laboratory room complies with Sentence 7.5.4.4.(1) of the Ontario Building Code at the Guelph Food Research Project, 93/95 Stone Road West, Guelph, Ontario, provided:

a) That no hazardous chemical interaction occurs in the subject corrosive waste venting system.

8. **Reasons**

a) It is our interpretation that Sentence 7.5.4.4.(1) of the Ontario Building Code does not require each trap serving a plumbing fixture capable of handling corrosive waste to be separately and individually vented to the exterior. It simply requires that the acid waste venting system be separate from that of the sanitary venting and that it extend to the exterior.

b) The Code is silent regarding the number of exterior termination points required of an acid waste venting system.

Dated at **Toronto** this **17th** day in the month of **February**, in the year **2000**, for application number **1999-90**.

Designate for the Respondent

RULING

1. **The Applicant**

   Mr. Steve Thurlow, Fire Chief, City of Burlington Fire Department, Burlington, Ontario, has applied for a building permit under the *Building Code Act, 1992*, to construct a new fire station known as Burlington Fire Station #7, located at 4100 Dundas Street, Burlington, Ontario.

2. **Description of Constrution**

   The Applicant is proposing to construct a new fire station facility. The building is described as one storey in building height, 658 m^2 in building area and is to be constructed of combustible construction. The building will not be equipped with a fire alarm system nor a standpipe and hose system. A partial sprinkler system, however, will be installed in the residential portion of the structure, an area dedicated for the living space of the fire fighting crews.

   The proposed fire station may be considered as having three major occupancies; Group C for the crew living space, Group D for the administrative offices, and Group F, Division 3 for the fire hall containing the vehicles and equipment. (The construction requirements, as determined in Subsection 3.2.2., for all three occupancies in the subject building are identical. The separations

required between the occupancies varies, however.) Fire separations with a fire resistance rating of 1.5 hours will be provided between the vehicle storage area and the remainder of the building. Between the administrative area and the residential a 1 hour rated separation will be constructed.

The construction in dispute involves the proposed sprinkler system intended for the residential portion of the fire station. The Applicant proposes that this system be built according to NFPA 13R, "Standard for the Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height". The sprinklers are being provided as a demonstration model to promote their use in residential buildings.

3. **Dispute**

There are two issues in dispute between the Applicant and Respondent. The first is whether the proposed sprinklering of only the residential portion of the new fire station (a facility not required to be sprinklered) provides sufficiency of compliance with Sentence 3.2.5.13.(1) of the Ontario Building Code. The second is whether the proposed sprinkler system, designed in accordance with NFPA 13R, also provides sufficiency of compliance with Sentence 3.2.5.13.(1). This provision requires, with certain exceptions, that a sprinkler system be designed, constructed, installed and tested according to NFPA 13, "Standard for the Installation of Sprinkler Systems". This Sentence applies even if a sprinkler system is not required in a building, i.e., elective or voluntary sprinkler systems - as is the case here - must also conform with Sentence 3.2.5.13.(1) and thereby NFPA 13.

In particular, NFPA 13 requires that the entire building be sprinklered. Moreover, NFPA 13 mandates a higher level of sprinkler protection than NFPA 13R in that all concealed spaces must also be provided with sprinkler protection. As mentioned above, however, the subject building is not required under the OBC to be sprinklered.

It should be noted that the exception found in Sentence 3.2.5.13.(2) does not apply to the case at hand. This provision permits *buildings* of residential occupancy that are less than four stories in height to comply with the more relaxed sprinkler standards found in NFPA 13R, "Standard for the Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height". This standard, however, is intended for buildings where residential is the only occupancy or at least the principal occupancy. This cannot be said of the subject building.

4. **Provision of the Building Code**

Sentence 3.2.5.13.(1) - Automatic Sprinkler Systems

1. Except as permitted by Sentences (2), (3) and (4), an automatic sprinkler system shall be designed, constructed, installed and tested in conformance with NFPA 13, "Standard for the Installation of Sprinkler Systems". (See Appendix A.)

5. **Applicant's Position**

The Agent for the Applicant submitted that: "The building in question is community based satellite Fire Station that is being constructed in a predominantly residential area of the city that is undergoing substantial development. This station will also house the Departments Public Education Office and this being the case this partial system will be used as an educational tool to promote Residential Sprinkler Installations which are endorsed by the Burlington Fire Department for enhanced life safety and property protection. It is acknowledged that there have been no design or construction concessions or the waiving of any code mandated requirements as the result of the implementation of this partial system.

"Sentence 3.2.5.13.(1) of the Building code would normally apply to a Fire Station if required to be protected with sprinklers, thus mandating compliance with the more stringent NFPA #13 Standard that would require protection throughout the building. Although this proposal doesn't comply fully it does however offer an enhanced level of protection in the residential area of the building which is separated from the Apparatus Bays and the remainder of the Station by a 1 ? hour fire separation. It is also believed that the "residential" area of the building could be equated to nothing more hazardous than a normal residential setting with a home occupation. This being the case it is argued that NFPA #13R would provide adequate protection for this area as covered under Sentence 3.2.5.13.(2).

"In summary, acceptance of this proposal will enhance the level of protection in living quarters area of the building and would also provide a valuable teaching tool for the Department in the educational promotion of similar residential systems. The Fire Department wants to be perceived by the public as practising what we preach while being fiscally responsible. By allowing the

installation of the proposed system, it will in no way be detrimental to the life and fire safety function or protection of this building."

6. **Respondent's Position**

The Designate for the Respondent submitted that: "Sentence 3.2.5.13.(1) of the Ontario Building Code 1997 edition requires automatic sprinkler systems to be designed, constructed and installed in accordance with NFPA-13, "Installation of Sprinkler Systems". While the same Sentence in previous editions of the OBC only required compliance with NFPA-13 when the sprinkler system was a required system, the 1997 edition was changed to require all sprinkler systems to meet the NFPA-13 standard.

"In NFPA-13, paragraph 1-6.1 states that a building containing an automatic sprinkler system must be protected with sprinklers in all areas. The Building Department does not have the authority to permit the installation of the sprinkler system within only a part of the facility.

"In addition, Sentence 3.2.5.13.(13) [sic] of the OBC 1997 edition states that NFPA-13R may be used in lieu of NFPA-13 where dealing with buildings of residential occupancies not exceeding 4 storeys in building height. While there is a residential component to this building, the major occupancy is deemed to be Group F, Division 2 [sic] with the storage of the fire fighting and rescue vehicles and therefore, the Building Department does not have the authority to accept a design not in conformance with NFPA-13."

7. **Commission Ruling**

It is the decision of the Building Code Commission the proposed sprinklering of the residential portion of the new fire station (a facility not required to be sprinklered) with a sprinkler system designed in accordance with NFPA 13R provides sufficiency of compliance with Sentence 3.2.5.13.(1) of the Ontario Building Code at Burlington Fire Station #7, 4100 Dundas Street, Burlington, Ontario.

8. **Reasons**

(i) The installation complies to NFPA 13R.
(ii) The facility is not required to be sprinklered.

Agent for the Applicant

RULING

1. **The Applicant**

   Mr. Christopher Boyd, Project Architect, Rebanks Architects Inc., Toronto, Ontario, has applied for a building permit under the *Building Code Act, 1992,* to construct a new Loblaws Supermarket, at the intersection of Princess Street and Bath Road, Kingston, Ontario.

2. **Description of Constrution**

   The Applicant is proposing to construct an addition to an existing mall that will serve as a Loblaws supermarket. The mall is 23 180 m^2 in building area excluding the Sears store, which is to be demolished and will be replaced by the proposed Loblaws facility. The addition is described as a two storey, non-combustible structure with a building area of 7,432 m^2, that is classified as having a Group E - (retail) mercantile major occupancy. The building is to be equipped with a sprinkler system and a fire alarm system, but not a standpipe and hose system.

   The roof assembly, as proposed by the Applicant, consists of Class A shingles and roofing felt nailed to 13 mm thick exterior grade fire-retardant treated plywood sheathing that is fastened to 18 gauge galvanized Z-shaped metal girts (spaced at 24 in. on centres) which are, in turn, mounted on 38 mm thick fluted metal decking on steel framing. Directly underneath the plywood sheathing will be a 25 mm air space below which will be (in descending order in the roof assembly) RSI 3.25 mineral fibre insulation sitting on 6 mm poly vapour barrier that rests directly on the metal decking. The majority of the proposed roof will be at an angle of approximately 30^0 to the horizontal.

The construction in dispute involves the intended use of combustible plywood sheathing in the proposed roof assembly of a building that is required to be constructed of non-combustible construction.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the proposed roof assembly that includes fire-retardant treated plywood sheathing intended for a building that is required to be noncombustible according to Article 3.2.2.57. provides sufficiency of compliance with Sentence 3.1.5.3.(2) of the Ontario Building Code. This provision allows a combustible roof under certain conditions but only if it is constructed above a concrete roof deck. The Applicant's proposed roof deck, however, is steel not concrete. Further, the OBC does not set out specific conditions which would permit a combustible roof over a metal roof deck.

4. **Provision of the Building Code**

Sentence 3.1.5.3.(2) - Combustible Roofing Materials

1. ,

2. Combustible roof sheathing and roof sheathing supports installed above a concrete deck are permitted on a building required to be of noncombustible construction provided:

c. the concrete deck is not less than 50 mm (2 in) thick;

d. the height of the roof space above the deck is not more than 1000 mm (3 ft 3 in);

e. the roof space is divided into compartments by fire stops in conformance with Article 3.1.11.5.;

f. openings through the concrete deck other than for non-combustible roof drains and plumbing piping are protected by masonry or concrete shafts:

   i. constructed as fire separations having a fire-resistance rating not less than 1 h; and

   ii. extending from the concrete deck to not less than 150 mm ($5^{7/8}$ in) above the adjacent roof sheathing;

g. the perimeter of the roof is protected by a noncombustible parapet extending from the concrete deck to not less than 150 mm ($5^{7/8}$ in) above the adjacent sheathing; and

h. except as permitted by Clause (d), the roof space does not contain any building services.

5. **Applicant's Position**

The Agent for the Applicant submitted that the proposed roof assembly which includes a fire-retardant plywood sheathing and rigid fibreglass insulation provides an equivalent level of safety to that intended in the OBC. As he argued, Sentence 3.1.5.11.(5) and Clause 3.1.14.2.(2)(b) allow the use of foam plastic insulation above a roof deck if the building is sprinklered. In his view, the plywood sheathing is less hazardous than the permitted foam plastic insulation because it has been treated with a fire-retardant thereby giving it a maximum flame-spread rating of 25. Moreover, since the proposed air space in the assembly is small, at 25 mm or less, flames will not propagate throughout such a restricted space regardless of the flame-spread rating, the Agent argued. He indicated that there were test results on wall assemblies to support this position.

The Applicant added that the treated plywood only chars, it does not propagate flame. Only continuous exposure to flame will cause the material to burn, he stated. Since the material is located between Class A shingles and metal roof decking it would therefore not be readily exposed to any exterior source of flame.

As well, since the building is being sprinklered (which allows the roof assembly to be unrated) the resulting ceiling temperature of 295^0C combined with an ambient temperature of 22^0C for a total temperature of 317^0C allows the use of the foamed plastic insulation in the roof assembly. The same principle of sprinkler protection, the Agent asserted, could also apply to the combustible plywood sheathing proposed for the roof assembly. As he argued, wood not treated with fire retardant protection has an ignition point of between 330^0C to 600^0C, but since this wood is treated it would not ignite unless exposed to a much higher temperature. (The proposed plywood is treated throughout, not just surface coated.) In other words, in the event of a fire the sprinkler system would actuate and keep the temperature in the ceiling and roof areas low enough that the combustible elements, specifically the plywood, would not ignite.

The Agent also argued that using treated plywood as the nailing surface has advantages over the permitted combustible cant strips. Plywood creates fewer voids in the roof assembly than the wood strips. As well, the untreated wood strips, if used, add significantly to the allowable combustible load in a roof assembly.

Lastly, the Agent noted that this exact same issue had been addressed in a previous BCC ruling (No. 99-57-713) also in Kingston. He indicated that in the earlier ruling, the Commission found

that the proposed roof assembly with fire-retardant treated plywood provided sufficiency of compliance with Sentence 3.1.5.3.(2) of the Code. He stated that he had asked that the municipality consider the present dispute with regard to the previous BCC ruling and approve the proposed roof assembly using their powers of "equivalency" in Section 2.7. of the Code. They refused.

For these reasons, the Agent argued that the proposed roof assembly provides sufficiency of compliance with Sentence 3.1.5.3.(2) of the OBC.

6. **Respondent's Position**

The Respondent chose not to attend the hearing. The Commission therefore relied upon his written submission only.

The Respondent stated that the proposed use of combustible plywood, albeit treated with a fire-retardant, in a roof assembly of a building required to be of non-combustible construction does not provide sufficiency of compliance with Sentence 3.1.5.3.(2) of the OBC. He noted that Sentence 3.1.5.3.(2) specifically permits a combustible roof sheathing under certain conditions but only if the roof deck is constructed of concrete. He indicated, however, that in the subject dispute the decking is to be steel, not concrete. As a result, he argued that the proposal does not comply with OBC Sentence 3.1.5.3.(2).

7. **Commission Ruling**

It is the decision of the Building Code Commission that the proposed roof assembly that includes fire-retardant plywood sheathing on Z-girts with a 25 mm air space and RSI 3.25 mineral fibre insulation mounted on a 38 mm decking provides sufficiency of compliance with Sentence 3.1.5.3.(2) of the Ontario Building Code at the Loblaws supermarket located at Princess Street and Bath Road, Kingston, Ontario.

8. **Reasons**

(i) Class A shingles will be used;
(ii) For Trent treated plywood, when the flame source is removed, the treated plywood ceases to char and since it will not support combustion the flame will not spread;
(iii) The treated lumber is considered equal or better than the permitted combustible nailing strips and foam insulation;
(iv) Mineral fibre insulation will be used.

Agent for the Applicant

RULING

1. **The Applicant**

   Mr. Tony Demakos, President, Holy Trinity Greek Community of London and Vicinity, London, Ontario, has applied for a building permit under the *Building Code Act, 1992,* to construct a new church facility known as the Holy Trinity Greek Orthodox Church, located at 131 Southdale Road, London, Ontario.

2. **Description of Constrution**

   The Applicant is proposing to construct a new one storey (plus partial basement) church building classified as having a Group A - Division 2 assembly occupancy. The church is proposed to be 1,176 m^2 in building area and will be of mainly noncombustible construction. The building will be equipped with a fire alarm system, but not a sprinkler system nor a standpipe and hose system.

   The construction in dispute involves the Applicant's intention to omit a standpipe and hose system from the church. While the building is only one storey, it has been designed with a large dome centred over the nave that measures approximately 18.3 m in height at its interior peak from grade level. The building height threshold for when a standpipe and hose system must be installed, however, is 14 m.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the church, proposed without a standpipe and hose system, but with a dome measuring approximately 18.3 m in height to the ceiling, provides sufficiency of compliance with Sentence 3.2.9.1.(1) of the Ontario Building Code. This provision sets out some of the conditions which require the installation of a standpipe and hose system in a building. In particular, Clause (b) of this Sentence requires a standpipe and hose system in buildings greater than 14 m in building height as measured to the ceiling of the top storey. The proposed dome of the church, which represents seven percent of the total building area, exceeds this height.

4. **Provision of the Building Code**

Article 3.2.9.1. - Standpipe Systems - Where Require

1. Except as provided in Sentences (4) to (7), a standpipe system shall be installed in every building that:
    a. is more than 3 storeys in building height;
    b. is more than 14 m (45 ft 11 in) high measured between grade and the ceiling of the top storey; or
    c. is not more than 14 m (45 ft 11 in) high measured between grade and the ceiling of the top storey but has a building area exceeding the area shown in Table 3.2.9.1. for the applicable building height if the building is not sprinklered.

5. **Applicant's Position**

The Agent for the Applicant submitted that the design of the subject church, proposed without a standpipe and hose system, provides sufficiency of compliance with Sentence 3.2.9.1.(1) of the OBC. He offered the following arguments to support this assertion.

The Agent argued that a standpipe and hose system would not be effective in terms of fighting fire in the upper portion of the structure's interior, especially in the dome. The building will contain no other access to the ceiling space of the dome that one could use to fight fire if a standpipe system was installed. As the Agent argued, the only access for fire fighting purposes

from the interior of the building is from the ground floor. However, from here, he noted, there is a clear view of the dome space to observe if a fire were to occur and the floor area would act as a suitable location from which to fight a fire.

In addition, the Agent argued that whereas the church is allowed to be combustible construction according to Article 3.2.2.25. it has been built with mostly noncombustible materials. All of the structural elements of the church including the dome are noncombustible construction, he noted. The wood sheathing is the only combustible element of the dome.

The Agent added that the dome, at approximately 74 m^2, represents only seven percent of the church's total building area and the average ceiling height of the entire structure is roughly 10.7 m. Moreover, the building area of the church is well below the threshold that would require a standpipe system, he added.

Lastly, the Agent noted that there is no occupied space above the ground floor therefore the present issue is not one of life safety.

In conclusion, based on the above arguments the Agent requested that the Commission consider that the disputed standpipe and hose system be waived for the subject building.

6. **Respondent's Position**

The Respondent chose not to attend the hearing. The Commission therefore relied upon his written submission only.

He submitted that a portion of the building has a height greater than 14 m above grade, thus a standpipe and hose system is required as per Clause 3.2.9.1.(1)(b) of the OBC. He stated that, in his view, the design of the building, without provision for a standpipe system, does not comply with requirements of the Code for new construction.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the design of the church, that includes a large central dome measured at a height in excess of 14 m, proposed without a standpipe and

hose system provides sufficiency of compliance with Sentence 3.2.9.1.(1) of the Ontario Building Code at the Holy Trinity Greek Orthodox Church, 131 Southdale Road, London, Ontario.

8. **Reasons**

(i) No occupancy in upper level;
(ii) Open floor space;
(iii) Access available at seven locations;
(iv) Non-combustible construction.

Dated at **Toronto** this **3rd** day in the month of **February**, in the year **2000**, for application number **2000-01**.

RULING

1. **The Applicant**

   Mr. Simon Ng, Architect, Simon Ng Architects, Toronto, Ontario, has received a building permit under the *Building Code Act, 1992,* and is currently constructing a church building known as the Toronto Chinese Community Church, located at 100 Acadia Avenue, Markham, Ontario.

2. **Description of Constrution**

   The Applicant is currently constructing a new church structure classified as a Group A, Division 2 assembly occupancy. The building is described as three storeys in building height, 2,868 m^2 in building area and of noncombustible construction. It will be equipped with a fire alarm system and a sprinkler system. The subject project is the last phase of a three building, 3.035 ha site that initially commenced development in 1987.

   As part of his overall strategy to manage surface water on the site, the Applicant is also proposing to slow the discharge rate of rain from the roof of the proposed church by using six (Zurn Control-Flo) flow control hoppers. A total of 15 intake slots will be provided among the six roof control hoppers. Through their design and positioning on the roof, these devices would

permit a maximum accumulation of water measured at 57 mm deep. At this depth the roof would hold a total of 158 m^3 of water for delayed run off purposes. Drainage from the flow control hoppers will be provided by a connected piping system that will ultimately flow to a 200 mm pvc pipe to be located 1.2 m below grade and which will extend under the west side of the building to an over-sized storm sewer that the Applicant is proposing to construct on the west and south of the building that will provide at least 78.5 m^3 of extra capacity.

The construction in dispute involves the design of the roof structure with respect to its support of live loads. In terms of structure, the roof has been designed only to support snow load plus the Subsection 2.5.1. 24 hour rain fall. The proposed roof is described as flat and has several different levels. A parapet of varying heights surrounds the roof. The framing construction of the building is structural steel.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the proposed roof, designed to delay the run off of rainwater but which is engineered to support either snow or rain load but not both, complies with Sentence 4.1.7.3.(3) of the Ontario Building Code. This provision stipulates that a roof, with certain exceptions such as where it is "intended to provide rain water retention", need not be designed based on the consideration that rain loads will "act simultaneously with" snow loads. Put simply, unless a roof is intended to store water, it does not need to be capable of structurally supporting snow as well as rain load.

Rain water retention provided on the roof of a building is done as a method of storing and managing stormwater on some properties. In such cases, rain water is held on the roof for a certain period and is released over time through devices such as flow control roof drains. It is these stormwater storage roofs to which Sentence 4.1.7.3.(3) is meant to apply. In the dispute at hand, the Applicant has indicated that the proposed roof is not a stormwater retention facility as intended in the OBC, but he has included flow control drains in his roof design and he does intend to slow the drain off of rain water from the roof so that it takes approximately 4 to 6 hours.

The OBC, however, offers no clarification regarding rain water retention, specifically how long water must be held before it is considered stored or retained and what the roof design implications are of storing water. To address this issue, the Housing Development and Buildings

Branch of the Ministry of Municipal Affairs and Housing issued a formal Branch Opinion on April 28, 1999 stating that if certain conditions were met in the roof design, the structure would not need to be considered as providing retention of rain water and would not have to be engineered as such.

The issue at dispute then is whether, through an interpretation of Sentence 4.1.7.3.(3), and by considering the intent of this provision as stated in the Branch Opinion and its attached conditions, the proposed roof, as designed, should be regarded as providing retention for rain water and thus must be designed for the combined live loads of snow and rain.

4. **Provision of the Building Code**

Sentence 4.1.7.3.(3) - Specified Rain Load

(3) Except as provided for in Sentence 4.1.7.1.(1) and except where a roof is intended to provide rain water

retention, loads due to rain need not be considered to act simultaneously with loads due to snow.

5. **Applicant's Position**

The Applicant submitted that the proposed roof complies with Sentence 4.1.7.3.(3) of the OBC. He based this assertion on the premise that their rain water control strategy proposed for the roof is only a 4 to 6 hour temporary delaying of run off and is not retention for the purposes of stormwater management, as the officials from Markham argue. He indicated that their stormwater management plan utilizes the existing unused capacity on the rest of the site as well as constructing an over-sized sewer as part of the current work for the exclusive use of the church. The plan does not rely upon any assumed storage of water on the church's roof. As a result, since the roof is not intended to store water, the building does not need to be constructed to support snow and rain live loads.

The Applicant argued that the Opinion released by the Housing Development and Buildings Branch on April 28th, 1999 supports his position. He indicated that the proposed church will fulfill the four conditions set out in the Branch Opinion. As he noted, the drain down time will be

far less than 24 hours, scuppers will be installed and the roof water depth will not exceed 57 mm, the roof drains will be closer than 15 m to the edge of the roof and less than 30 m to each other, and there will be six drains serving a total roof area of 2,790 m^2.

The Applicant also noted that he has made direct inquiries with the Canadian Institute of Steel Construction and the Housing Development and Building Branch regarding the intent of Sentence 4.1.7.3.(3) and its application with respect to the structural design of a building.

In conclusion, he stated that the current interpretation of the Markham Building Department regarding the use of roof control flow hoppers forces unnecessary and additional construction costs on project proponents in the form of enhanced structural support in the building or extra capacity in underground storage tanks.

6. **Respondent's Position**

The Respondent submitted that he interprets Sentence 4.1.7.3.(3) of the Code as requiring that both snow and rain loads be considered when the proposed roof is intended to retain water. As he stated; "the stormwater management consultant for the subject project has designed a stormwater drainage system that intentionally relies upon the storage (actual wording used by the consultant) of 158 m^3 of stormwater on the roof of the subject building. This quantity has been calculated using a 1 in 100 year storm event as required by the Town of Markham Engineering Department. It is the opinion of the chief building official therefore that the roof must be designed to support the simultaneous loading of rain and snow as required by Sentence 4.1.7.3.(3)."

The Respondent argued that "the branch opinion issued in April of 1998 addressed the general use of flow control roof drains and their effect on the design of roof structures." This opinion, he added, "which was based on provisions contained in the 1995 National Pluming Code, was intended to clarify that where flow control roof drains are routinely utilized outside the scope of a stormwater management design, loads due to rain need not be added to loads due to snow." The Respondent continued by noting that the opinion, however, concludes by stating that "where the roof drainage system exceeds the limitations (set out in the conditions) contained above or where the roof is designed for permanent storage of stormwater, the potential for additional structural loading of rain and snow has to be considered." He argued that this was the case in the present proposal since, in his view, the roof has been designed with the intention of storing water.

To support his interpretation, the Respondent then presented arguments about the development of this provision and in particular its recent amendment in the current version of the Building Code. He argued that the change was included to clarify that roofs that are to retain water must be built for snow and rain load. It did not provide any relaxation for roofs that are to temporarily hold water.

For the above reasons, the Respondent concluded by stating that the requirements of Sentence 4.1.7.3.(3) applies to this application and both loads should be considered in the design and construction of the church.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the proposed roof, designed to delay the run off of rainwater but which is engineered to support either snow or rain load but not both, complies with the requirements of Sentence 4.1.7.3.(3) of the Ontario Building Code for the Toronto Chinese Community Church at 100 Acadia Avenue, Markham, Ontario, provided:

a) The maximum drain down time does not exceed 24 hours;
b) Scuppers are installed so that the maximum depth of water on the roof cannot exceed 150 mm;
c) Drains are located not more than 15 m from the edge of the roof and not more than 30 m from adjacent drains; and,
d) There is at least one drain for each 900 m^2 of roof.

8. **Reasons**

1) The structural design of a roof incorporating flow control roof drains need not be treated any differently from a conventionally drained roof if the roof drainage system conforms to the conditions listed as a), b), c) and d); and,
2) The roof system is designed as part of a stormwater management system for delaying discharge of rainwater and is not designed as a storage facility.

RULING

1. **The Applicant**

   Mr. Al Evans, Project Manager, David J. Cupido Construction Limited, Kingston, Ontario, has received a building permit under the *Building Code Act, 1992* and is currently constructing a care facility for deaf and blind persons known as the McInnes House at 170 Henry Street, Kingston, Ontario.

2. **Description of Constrution**

   The Applicant is currently constructing a new care facility intended as a residence for 14 deaf and blind persons. The building is described as one storey in building height, 665.53 m^2 in building area, and is of combustible construction. The structure is slab on grade construction (with in-floor hydronic heating) and therefore has no crawl space or basement. The building is classified as having a Group B, Division 3 (care) occupancy under the 1997 Ontario Building Code.

   The building is to have a total of six independent suites, each with their own livingroom and diningroom areas and kitchen and bathroom facilities. Four of the suites are to have three bedrooms, while the other two will be single bedroom units for a total of 14 bedrooms. All of the suites are provided with at least one barrier-free accessible washroom. The suites are arranged three per side along a central corridor that is equipped with exit doors at each end.

Administrative offices, staff washrooms, an activity room and mechanical and electrical rooms are located off either side of the central corridor as well. There will also be a mechanical room located in the central portion of the attic space that will house the air conditioning equipment. Beyond the two exits that will lead directly to the exterior at grade level, each suite and the activity room will contain an inward swinging, access door that will also lead directly to the exterior.

Fire separations with a 3/4 hour fire-resistance rating are to be provided in the wall assemblies between the suites (as well as the administrative areas) and between the suites and the corridor. The same fire-resistance rating will be provided in the separation between the ceiling and attic space. The mechanical room in the attic will also be enclosed with 3/4 hour rated walls.

The structure will be equipped with a computerized, centrally controlled and monitored motion sensor and fire alarm system as well as a sprinkler system. The alarm system will be equipped with pull stations, strobe lights (corridor only) and sirens and will be interconnected with the smoke detectors. Smoke detection will be provided throughout the floor area, but only in the mechanical room of the attic. There is also a fire hydrant on the property.

Staff will be present in the facility 24 hours a day to provide supervision and assistance for the residents. The staffing level will be at its lowest overnight when a minimum of three persons will be present. The motion sensor will enable staff to determine when residents are moving about within their rooms and/or suites. This will give staff the opportunity to visit the resident to ascertain if they need assistance. All 14 of the residents are ambulatory. This may change with time, however. The construction in dispute involves the proposed sprinkler system. The Applicant is proposing that the sprinkler system be designed and installed in accordance with the requirements of NFPA 13R, "Standard for the Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height."

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the proposed sprinkler system, designed according to NFPA 13R, and intended for use in a Group B, Division 2 occupancy provides sufficiency of compliance with Article 3.2.2.40. and Sentence 3.2.5.13.(1) of the Ontario Building Code.

Article 3.2.2.40. requires that a B2 occupancy must be sprinklered even though it may be of combustible construction. Sentence 3.2.5.13.(1) states that a required sprinkler system must meet NFPA 13, whereas Sentence 3.2.5.13.(2), provides an exception to Sentence (1) by allowing low rise (four stories or less) residential occupancies to comply with the more relaxed sprinkler standards found in NFPA 13R. The basic difference between these sprinkler systems is that the NFPA 13 standard requires that all spaces of a building be protected with sprinklering. This includes unoccupied areas such as closets and concealed spaces such as attics and crawl spaces. The NFPA 13R standard, on the other hand, stipulates that a sprinkler system need only be designed and installed for all occupied rooms.

In such an application in order to ascertain the sprinkler requirements it is therefore essential to determine whether the subject building can be considered residential due to its use and occupancy. Article 3.1.2.5. permits certain buildings classified as having a Group B occupancy to be considered residential occupancies in the appropriate circumstances and under various conditions. The conditions set out in this provision are that the occupants operate as a single housekeeping unit, that there is sleeping accommodation for no more than ten persons and that no more than two persons would require assistance to evacuate in case of an emergency.

The subject proposal does not meet any of the conditions stipulated in Article 3.1.2.5. With six separate suites, the residents would not operate as a single housekeeping unit. Sleeping accommodation is provided for 14 persons. As well, due to the fact that the residents will possess certain degrees of blindness and deafness obviously more than two persons would require assistance to evacuate in an emergency. As a result, the subject building cannot be considered as residential as per Article 3.1.2.5. and as a Group B occupancy is thus required under the OBC to install a sprinkler system as per NFPA 13.

At issue therefore, is whether the proposed B3 building offers any compensating measures to achieve sufficiency of compliance with Article 3.2.2.40. and Sentence 3.2.5.13.(1), which require that the sprinkler system be built according to NFPA 13.

4. **Provision of the Building Code**

Article 3.2.2.40. - Group B, Division 2 or Division 3, up to 2 Storeys, Sprinklered

1. A building classified as Group B, Division 2 or Division 3 is permitted to conform to Sentence (2) provided:
    a. except as permitted by Sentence 3.2.2.7.(1), the building is sprinklered;
    b. it is not more than 2 storeys in building height; and
    c. it has a building area not more than:
        i.) 2,400 m^2 (25,800 ft^2) if 1 storey in building height; or
        ii. 1,600 m^2 (17,200 ft^2) if 2 storeys in building height.
2. The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and:
    a. floor assemblies shall be fire separations with a fire-resistance rating not less than 45 min,
    b. mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min, and
    c. loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

Sentences 3.2.5.13.(1) and (2) - Automatic Sprinkler Systems

3. Except as permitted by Sentences (2), (3) and (4), an automatic sprinkler system shall be designed, constructed, installed and tested in conformance with NFPA 13, "Standard for the Installation of Sprinkler Systems". (See Appendix A.)
4. Instead of the requirements of Sentence (1), NFPA 13R, "Standard for the Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height", is permitted to be used for the design, construction, installation and testing of an automatic sprinkler system installed in a building of residential occupancy that is not more than 4 storeys in building height.

Article 3.1.2.5. - Group B, Division 3 Occupancies

5. Group B, Division 3 occupancies are permitted to be classified as Group C major occupancies provided:
    a. the occupants live as a single housekeeping unit in a dwelling unit with sleeping accommodation for not more than 10 persons; and
    b. not more than 2 occupants require assistance in evacuation in case of an emergency.

5. **Applicant's Position**

The Applicant submitted that the proposed design of the building provides a similar level of life safety to that intended in the OBC and thereby provides sufficiency of compliance with Article 3.2.2.40. and Sentence 3.2.5.13.(1). In addition to the fire safety features shown on plan, he indicated that he was also prepared to supply the entire floor area of the building with sprinkler protection conforming to NFPA 13, which would include concealed spaces such as closets and all washrooms (even those less than 5.1 m^2) as well as adding smoke detection in rest of attic. This would leave the attic as the only unsprinklered area, he noted.

The Applicant also argued that although the residents are deaf and blind, due to the nature of their disabilities they become very familiar with their physical surroundings and once advised to evacuate could do so quickly. Also, with a minimum of 3 staff to assist in evacuation and with doors leading directly to the exterior in each suite, the total emergency evacuation process would be prompt and orderly. He indicated that a fire safety plan is being developed in conjunction with the local fire department.

Lastly, the Applicant indicated that, in his view, the primary benefit of installing a fully compliant NFPA 13 sprinkler system would be enhanced property protection. He stated that with respect to the subject care home he believes it has been designed with cost effective, but adequate, life safety features.

6. **Respondent's Position**

The Respondent chose not to attend the hearing. The Commission therefore relied upon his written submission only.

The Respondent submitted that the NFPA 13 standard of sprinklering provides a greater degree of protection than NFPA 13R. Moreover, the building at hand, he argued, would contain more than two people who would require assistance to evacuate in an emergency. As a result, the subject building does not meet the criteria found in Article 3.1.2.5. of the 1997 Ontario Building Code that allows a care facility to be considered as having a residential occupancy. As a care occupancy, therefore, the structure must conform to the NFPA 13 standards for sprinkler design and installation.

No comment was provided as to whether any of the proposed compensating measures were, in his view, adequate.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the proposed sprinkler system in the group home (known as the McInnes House) at 170 Henry Street, Brantford, Ontario, provides sufficiency of compliance with Article 3.2.2.40. and Sentence 3.2.5.13.(1) of the Ontario Building Code on condition that:

i) Smoke and heat detectors are provided throughout the attic spaces including the mechanical room and that these are interconnected with the heat detection system installed in the occupied areas.
ii) The mechanical area in the attic is sprinklered as well as all spaces on the main floor.

8. **Reasons**

(i) The building is a non-smoking facility.
(ii) There are two egress routes from each suite.
(iii) There are pull stations in the common areas as well as at the suite exits and these are interconnected with the smoke/heat detection system.
(iv) There is trained supervision done in conjunction with the fire department.
(v) A building evacuation plan will be developed and the occupants will be trained.
(vi) There is a 100 mm water line and fire hydrant on site.

Dated at **Toronto** this **13th** day in the month of **January**, in the year **2000**, for application number **1999-88**.

RULING

1. **The Applicant**

   Mr. Daniel Teramura, Moriyama and Teshima Architects, Toronto, Ontario, has received a building permit under the *Building Code Act, 1992* and has recently constructed a new YMCA facility - known as the Durham YMCA - at 99 Mary Street North, Oshawa, Ontario.

2. **Description of Constrution**

   The Applicant has recently constructed a new YMCA complex classified as having Group A, Division 2 and 3 major occupancies. The structure is described as two storeys in building height, 5 574 m^2 in building area and is of noncombustible construction. The building has four main areas. On the ground floor there is a gymnasium, pool and licenced daycare centre, and on the second floor there is a conditioning area with a running track. Also found on the ground floor is a child minding area, which is separate from the day care centre.

   The construction in dispute involves the guards surrounding running track and conditioning area and in the gymnasium. At the running track and conditioning area the guards serve to separate second storey spaces that overlook the ground floor. The as-built guards are described as 1 070 mm in total height and are constructed with a single steel rail supported at regular intervals by vertical steel posts. Fastened to the posts and acting as infill between the posts, rail and floor

surface are a series of panels comprised of 50 by 50 mm welded wire mesh sheets attached to a steel frame. The openings surrounding each infill panel are 100 mm to the floor, 50 mm to the vertical posts and 50 mm to the rail above.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the operation of the building compensates for the as-built guards constructed mainly with panels comprised of 50 by 50 mm welded wire mesh and thereby provides sufficiency of compliance with Sentence 3.3.1.17.(5) of the Ontario Building Code. This provision stipulates that unless it can be shown that openings in a guard do not pose a hazard, the guard should be designed so as not to facilitate climbing.

Both parties to this dispute apparently agree that the design of the guard could facilitate climbing. The dispute, however, is whether in this instance, as utilized in the subject supervised YMCA building, the guards constitute a hazard. Specifically at issue therefore is whether the intended supervised use of the building and the limited access to certain areas of the facility compensate for the inherent climbability of the guards.

4. **Provision of the Building Code**

Sentence 3.3.1.17.(5) - Guards

Unless it can be shown that the location and size of openings do not present a hazard, a guard shall be designed so that no member, attachment or opening located between 140 mm and 900 mm above the level protected by the guard will facilitate climbing.

5. **Applicant's Position**

At the outset, the Agent for the Applicant indicated that it was his understanding that the permit application had been made when the previous version of the Ontario Building Code was in effect. As a result, it could be possible to review this situation under the former edition of the OBC, he stated. In this case the guards would be in compliance, he argued, because the previous version of the Code had no requirements regarding climbability of guards in Part 3 buildings.

Nevertheless, the Agent indicated that he would also present arguments regarding sufficiency of compliance with the current version of the OBC. He submitted that used under the present

circumstances in the subject YMCA, the guards, as designed and constructed, do not present a hazard and thereby provide sufficiency of compliance with Sentence 3.3.1.17.(5) of the OBC.

The Agent stated that the disputed guards are located at the running track and conditioning area, which are spaces used primarily by adults and eligible youth. The youth who do utilize these areas of the YMCA are required to pass a proficiency test demonstrating that they understand the hazards of using the conditioning area and its equipment. This upper level of the building, he added, is not open to the general public. As a result, he argued that only persons aware of the guard's potential climbability would be allowed in the area and if they are they would be supervised.

In addition, the Agent argued that beyond limiting the access of the areas served by the guards, the YMCA also provides supervision of young children through its child monitoring area located on the ground floor. This area is offered so that the adults using the YMCA can exercise, etc. while their children play in an attended environment. It also means that children would not be present in the areas served by the guards.

Lastly, the Agent argued that other YMCA facilities in the Greater Toronto Area, such as the ones in Toronto, the former North York and Mississauga, have used the same guards for 10 to 20 years without incident.

In conclusion, the Agent stated that while he agrees the guards could be considered climbable by small children, in the location and circumstances under which they are used, they do not present a hazard.

6. **Respondent's Position**

The Respondent submitted that the location of the guards and size of their openings present a hazard and thus do not meet the requirements of Sentence 3.3.1.17.(5). He indicated that the guards are obviously climbable and consequently pose an inherent danger.

The Respondent rejects the idea that the present issue could be regarded under the previous version of the OBC since the entire building had been reviewed under the 1997 edition. As he stated, it is not possible to pick and choose between versions of the Code.

He noted that the wire mesh guards are not limited to the running track and conditioning area and are used elsewhere in the building, including at the open sides of the stairs, ramps, and second

floor balconies. Due to their widespread use, the likelihood that children will come in contact with the climbable guards is high. He also argued that he was not convinced that the disputed areas of the building would be completely restricted in terms of access by children nor would it receive adequate supervision when children are present. As a result, the Respondent indicated that the as-constructed guards, in his opinion, are not acceptable and he stated that he felt he did not have the authority to allow such a deviation from the Code.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the guards as installed at Durham YMCA, 99 Mary Street North, Oshawa, provide sufficiency of compliance with Sentence 3.3.1.17.(5) of the Ontario Building Code.

8. **Reasons**

(i) There is restricted access to the areas (which contain the guards) by the use of coded entry cards.

(ii) There is a YMCA policy (visibly displayed) which restricts access to children to these areas.

(iii) There is full time supervision in the areas that contain the guards.

iv) Children between the ages of nine and twelve must pass a proficiency test to use the restricted areas.

Dated at **Toronto** this **13th** day in the month of **January**, in the year **2000**, for application number **1999-84**.

RULING

1. The Applicant

Mr. Mark Bodrug, Planner, The TDL Group Ltd., Oakville, Ontario, has applied for a building permit under the *Building Code Act, 1992*, to construct a Tim Hortons drive-through and restaurant facility at 401 Simcoe Street, Highway No. 3, Norfolk, Region of Haldimand, Ontario.

2. Description of Construction

The Applicant is proposing to install a new aerobic Class 4 sewage system to serve a new, drive-through and 61 seat Group A, Division 2 - (food service operation) occupancy located on Highway No. 3. Consistent with the expanded range of food provided at their other outlets, the proposed Tim Hortons facility will offer (beyond the traditional coffee and doughnuts) sandwiches, soups, bagels, muffins, etc. When completed, the subject facility will contain 37.5 fixture units, a total finished floor of 281.5 m^2 and a total daily design flow rate, as calculated by the Applicant, of 9,821 L/d.

The proposed sewage system consists of two septic tanks, a 10,000 L low profile tank to receive wastes directly from the kitchen and a 12,000 L tank which would serve the sanitary sewage from the building.

Effluent would travel by gravity from the smaller through the larger tank and into a 1.8 m diameter pumping chamber equipped with a double pump system and a alarm float. From there the effluent would be sent to three 6,800 L NPS Aerobic CCA 10 secondary treatment units, each fitted with a pump. The secondary quality effluent would then be pumped to three leaching beds each comprised of eight runs of 27 metres for a total bed of 648 m. A 23,000 L surge, or balancing, tank is connected to the outlet end of the three NPS secondary treatment units and receives overflow from those units via gravity.

The site is described as having a variable topography, covered with grass and has a total area of 22,202 m^2. The percolation rate of the native soil (fine sand), as determined from sampling, is approximately 12 minutes per centimetre and the soil has a depth of 16 m. (The clay fill present in one of the proposed leaching bed areas will be removed to the level of the native fine sand.) The highwater table is measured at 15 m below the surface. The site will be served by a new cased well.

The construction in dispute involves the proposed total daily design sanitary sewage flow for the subject structure as determined by its occupancy.

3. Dispute

There are two issues in dispute between the Applicant and Respondent. The primary issue is whether the type of occupancy, proposed as a drive through/sit down restaurant, conforms to an establishment listed in Table 8.2.1.3.B, or should be permitted to comply with Sentence 8.2.1.3.(4) of the Ontario Building Code. This provision allows the total daily design sanitary sewage flow to be calculated based on the highest metered flow of three similar establishments if the occupancy does not fit within the categories set out in Table 8.2.1.3.B. This Table lists numerous "Food Service Operations" and their sewage volume per seat, etc. Doughnut Shops are listed as item "e" and are shown to have a daily flow of 400 L per seat. Using this figure times the number of seats (61) yields a flow of 24,400 L per day, far in excess of the Applicant's claim of 9,821 L per day. However, considering the expanded range of foods now proposed to be dispensed at this facility, the issue at hand is whether subject facility should still be considered a doughnut shop. If so, then due to the 10,000 L/d threshold in the OBC, the calculated daily flow of 24,400 L would mean that the proposed application is not regulated under the Code and therefore the municipality and the Commission would not have jurisdiction over the matter.

Assuming the Commission interprets the subject proposal as being something other than the categories listed under "Food Service Operation", including doughnut shop, as shown in Table 8.2.1.3.B., the secondary issue to be addressed is whether, through the use of balancing tanks, the flow of a sewage

system may be calculated on the basis of the "average daily sanitary sewage flow for the week" as described in A-8.2.1.3.(1) & (2), the Appendix note to Sentences 8.2.1.3.(1) and (2). (These Sentences deal with determining daily design flow.) The Appendix note, as shown below, indicates that flows may be balanced and that the system may be designed (not calculated) using a daily flow that is equal to an average daily flow based over a week. Sentence 8.2.1.3.(4), on the other hand, stipulates that when calculating sewage flow the highest flow rates of other similar establishments must be used. At issue therefore, is whether in calculating the flow rate of a proposed sewage system the peak, or highest, daily flow rate must be used, or whether an average flow is acceptable. Again, based on the figures submitted, if the highest flow rate is the operable figure, the Tim Hortons facility would exceed the 10,000 L limit.

4. Provisions of the Ontario Building Code

8.2.1.3.(1),(2) and (4) - Sewage System Design Flows

(1) For residential occupancies, the total daily design sanitary sewage flow shall be at least the value in Column 2 as determined from Table 8.2.1.3.A. (See Appendix A.)

(2) For all other occupancies, the total daily design sanitary sewage flow shall be at least the value as determined from Table 8.2.1.3.B. (See Appendix A.)

(4) Where an occupancy is not listed in Table 8.2.1.3.B., the highest of metered flow data from at least 3 similar establishments shall be acceptable for determining total daily design sanitary sewage flow.

A-8.2.1.3.(1) & (2) Balancing Tanks

Where variable daily flows or peak flows occur, the flows to the sewage system may be balanced. The sewage system and any pump(s) that are installed to move the sanitary sewage, should be sized to accommodate a daily sanitary sewage flow at least equal to the average daily sanitary sewage flow for the week. Balancing tanks should be sized in accordance with good engineering practice to ensure that peak flows can be accommodated.

5. Applicant's Position

The Applicant submitted that the proposed Tim Hortons facility, with a calculated daily design flow of 9,821 L per day, complies with the technical requirements of the Ontario Building Code. On the issue of whether a Tim Hortons facility be considered as something other than a doughnut shop, he argued that

over the last ten years their corporation has expanded the range of food that they dispense. He noted that only 18 percent of their sales now come from doughnuts. Ten years ago that figure was 75 percent. Aside from coffee, the rest of their sales now come from all the other foods on their menu, such as bagels, sandwiches and soups. In fact, the Applicant described their operation not as a doughnut shop but as a "quick service restaurant".

The Applicant also argued that how they operate their locations is different than it was in the past. For example, many of their outlets are equipped with drive through facilities, which accounts for approximately 40 to 60 percent of a typical store's business. As well, many of their locations, including the present application, are now open 24 hours. As a result, due to their expanded food service and the changed nature of their operation, the Applicant asserted that they no longer fit within the traditional concept of a doughnut shop as contain in the OBC. Consequently, he argued that it was appropriate for them to use Sentence 8.2.1.3.(4), which permits them to use metered data from some of their other locations.

With respect to the issue of whether the highest metered flow must be used, the Applicant argued that the Appendix note A-8.2.1.3.(1) & (2) appears to indicate that a sewage system can be built on the premise of a weekly average flow, if one installs a balancing tank. The Appendix note refers to the "sizing" of a sewage system, which infers the calculation of flows to determine capacity, he stated. He also argued that, in his view, the reason for the inclusion of the subject Appendix note in the OBC was because it recognized that with the use of water saving devices sewage flows can be reduced and therefore offered designers greater flexibility.

Based on this view, the Applicant then explained how he arrived at his figures for the sewage flow of the proposed building. He indicated that he examined ten other Tim Horton locations and chose six of them for a comparison. Of these, the average of the peak flows was 251 L/seat/day, however, based on the average extended over a weekly basis (as per the Appendix note) the calculated flow rate was 161 L/seat/day. Using this latter figure and considering the number of seats (61), he arrived at a design flow of 9,821 L. This, he argued, fell below the 10,000 L threshold and could therefore be reviewed under the OBC.

(The Applicant did not provide any data as to the similarity of the other locations to the proposed restaurant with respect to the traffic patterns or catchment areas.)

6. Respondent's Position

On the first issue, the Respondent submitted that, in his view, the subject facility is a doughnut shop and is therefore listed in Table 8.2.1.3.B. of the OBC. As a result, the daily sewage flow for the building, based on 400 L per day times 61 seats, would be 24,400 L. This, he noted, would clearly take the proposal beyond the limit set out in the Code.

With respect to whether a weekly average can be used to determine sewage flow, he stated that Sentence 8.2.1.3.(4) clearly states that the highest of flows must be used. On this basis, even using the numbers put forward by the Applicant for peak flow (251 L) the proposal would also greatly exceed the 10,000 limit. He argued that the Applicant was using the average of the average to reach his flow figures. In his view, this is not the intent of the Code.

7. Commission Ruling

It is the decision of the Building Code Commission that the occupancy of the proposed

Tim Hortons restaurant with donuts and quick service food and a single drive through does not fully conform to the list of establishments in Table 8.2.1.3.B. It is therefore appropriate to consider the calculation of the total daily design sanitary sewage flow under Sentence 8.2.1.3.(4).

On the basis of the water use data provided, it is the decision of the BCC that the highest metered flows on a per seat basis would result in a total daily design sanitary sewage flow in excess of 10,000 litres per day for the proposed building.

Under Clause (f) of Article 1.1.3.2. (as amended by Ontario Regulation 278-99), this proposed system fails the definition of a sewage system. Accordingly, the approval of the system design is the responsibility of the Ministry of Environment.

8. Reasons

a. The Applicant's proposed flow figures, which include an average of 161 litres per seat for six restaurants over a three year period, demonstrates a trend of annual flow increases.
b. The proposed flow is less than the highest year average shown by the Applicant. Applying this average would result in a calculated flow in excess of 10,000 L.
c. A number of metered flows (shown in three month periods) exceed 10,000 L per day for smaller restaurants.

d. The Code does not permit the use of balancing tanks to reduce the total daily design sanitary sewage flow for the purposes of determining conformity to Article 1.1.3.2.

RULING

1. **The Applicant**

   Mr. Dan Alexander, Superintendent of School Support Services, Near North District School Board, North Bay, Ontario has received a building permit under the *Building Code Act, 1992* to construct an addition onto, and renovate, an existing bleacher facility known as the Trojan Alumni Complex at West Ferris Secondary School, 60 Marshall Park Drive, North Bay, Ontario.

2. **Description of Constrution**

   The Applicant is currently constructing an addition onto, and renovating an existing bleacher structure which is situated in the football field of West Ferris Secondary School. The bleacher building is located approximately 90 m from the school building. The existing bleacher facility is described as one storey in building height and is 262 m^2 in building area. The bleachers are constructed of noncombustible construction consisting of 203 mm thick precast hollow core

slabs as the upper and lower walking surfaces and 102 mm thick precast bleacher slabs as seating supported by load-bearing masonry walls. The space below the bleachers is to be renovated and will be used for dressing rooms, showers and a training room.

The addition, to be built on the west side, or to the rear, of the existing structure, is described as one storey, 288 m^2 in building area (which includes a covered walkway on the addition's west side) and is constructed mostly of combustible (wood) construction but has a steel roof. The addition is to be used mainly for a concession area but will also contain a kitchen, washrooms, and storage and utility rooms.

The proposed expanded bleacher facility is classified as a Group A, Division 4 (open air) assembly occupancy. It will have a total occupant load of 1,034 persons, 580 allocated to the bleachers themselves and 454 persons within the addition and in the renovated space below the bleachers. The completed structure will be equipped with a fire alarm system, but not a sprinkler system.

The construction in dispute is the omission of a sprinkler system in the space directly below the bleachers.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the noncombustible bleachers, with a calculated minimum fire-resistance rating of 1.36 hours, offered in lieu of sprinklering the spaces below, provides sufficiency of compliance with Sentence 3.2.2.35.(4) of the Ontario Building Code. This provision requires that sprinklers must be installed in all spaces below the tiers of seats in a Group A, Division 4 building. By allowing the subject building to be of noncombustible construction, however, it permits the wall, floor and ceiling assemblies to be unrated separations. While the Applicant does not intend to sprinkler the area below the bleachers, he is offering an enhanced fire-resistance rating (at least 1.36 hours according to his own calculations) in terms of the construction of the bleacher building. At issue then, is whether the supplemented minimum fire-resistance rating of the bleachers compensates for the omission of the required sprinkler system and thereby achieves sufficiency of compliance with Sentence 3.2.2.35.(4)

4. **Provision of the Building Code**

Sentence 3.2.2.35.(4) Group A, Division 4

4. Sprinklers shall be installed in all spaces below tiers of seats in a building classified as Group A, Division 4 if those spaces are used for occupancy.
   (See Appendix A.)

5. **Applicant's Position**

The Agent for the Applicant submitted that the enhanced fire separation compensates for the omission of sprinklers below the bleachers and thus provides sufficiency of compliance with Sentence 3.2.2.35.(4). He explained that intent behind the sprinkler requirement was to provide protection for people sitting in the bleachers viewing sporting events. This protection, he argued, was still being provided but through additional fire containment due to the increased fire separation. He noted that the 1.36 hour separation offered in the bleacher seating component was the minimum resistance provided. The other components of the bleacher construction provided even higher fire resistance rating, specifically the reinforced block walls offered a 1.9 hour rating while the hollow core slabs allowed a 2 hour rating.

The Agent also argued that the new use of the space below the bleacher seats, as dressing and training rooms and as a washroom, will not pose an undue fire risk. These rooms will have a low fire load in terms of stored material and will be of noncombustible construction, he added. As well, the activities that are to occur in these spaces are non-fire related.

The Agent stated that based on the fact that the minimum fire-resistance rating of the structure is 1.36 hours and that the combustible load will be low, the users of the bleachers will have more than adequate time to evacuate in an emergency. The new fire alarm system will also provide some early warning to persons in and on the facility.

6. **Respondent's Position**

The Respondent submitted the proposed addition and renovation are regulated by Article 3.2.2.35. and in particular Sentence (4) which requires that the space under the bleachers be sprinklered. Since the Applicant did not intend to sprinkler this area, the Respondent indicated that he felt the proposal did not comply with the Code. He made reference to Appendix A to the OBC which provide further clarification of the requirement to sprinkler such spaces.

The Respondent indicated that he felt he did not have the authority to accept such a proposal.

7. **Commission Ruling:**

It is the decision of the Building Code Commission that the noncombustible bleachers with a minimum calculated fire-resistance rating of 1.36 hours, offered in lieu of the sprinklering the space below, provides sufficiency of compliance with Sentence 3.2.2.35.(4) of the Ontario Building Code at the Trojan Alumni Complex at West Ferris Secondary School, 60 Marshall Park Drive, North Bay, Ontario.

8. **Reasons:**
9. Sufficiency of compliance has been achieved through the provision of the enhanced fire-resistance rating of 1.36 hours in the bleacher construction.

Dated at Toronto, this 9th day, in the month of December, in the year 1999, for application number 1999-80.

RULING

1. **The Applicant**

   Mr. Peter Turner, Principal, Turner Fleischer Architects Inc., Toronto, Ontario has applied for a building permit under the *Building Code Act, 1992*, to construct a townhouse condominium project at 1590 O'Connor Drive, Toronto, Ontario.

2. **Description of Constrution**

   The Applicant is proposing to construct 12 new, Group C (residential) condominium townhouse structures. The buildings are described as three storeys (plus basement) in building height, having various sized building areas (all are Part 9 buildings) and are constructed of combustible construction. A total of 94 units are proposed for the project, with 31 one of these to be built on the concept of live/work spaces.

   All of the live/work units of the project face onto O'Connor Drive, a large commercial street. The work portion of the live/work are proposed to be located at the front of the ground floor only and would have a direct entrance onto O'Connor Drive. Another ground floor entrance, for the residential portion of the units, is to be located at the rear of each unit.

The Applicant is also proposing to separate the work component from the residential area of the units by constructing the walls and ceiling of the work area as a one hour fire separation.

The construction in dispute involves the area of the proposed live/work units. As measured without factoring in the stairs and the unfinished basement, the typical live/work unit will have an area of 146.7 m^2. When the excluded areas, the stairs and basement, however, are added, the calculated area of the live/work units increases to approximately 204 m^2.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the proposed live/work units measuring 146.7 m^2 in area, excluding stairs and unfinished basements, comply with the definition of live/work units provided in Article 1.1.3.2. of the Ontario Building Code. The OBC definition of a live/work unit, as shown below, limits the "area" of such a unit to 150 m^2. The total area of the proposed units, at roughly 204 m^2, exceeds the 150 m^2 limit by 54 m^2, or 36 per cent.

The intention of the 150 m^2 area limit, as stated in the Housing Development and Buildings Branch's Technical Background Information memo, is "to restrict the size, fire load and hazard associated with these special units. The size limit also has the practical effect of helping to ensure live/work units are used as residential units, rather than Group D or Group F, Division 3 occupancies with subsidiary sleeping areas."

The OBC does not contain a definition of area as it pertains specifically to a live/work unit. It does contain a definition of floor area (also shown below) which offers a method of calculating the space on the various storeys of a building, but which excludes certain areas such as exits and the spaces set aside for vertical service shafts. In the present dispute, however, by proposing to exclude the stairs but as well the unfinished basement, the Applicant is seeking relief from more than that set out in the definition of floor area. At issue therefore is whether, in the calculation of the area of a live/work unit, the stairs and unfinished basement can be excluded. If not, the issue to be addressed then is whether the Applicant is proposing adequate compensating measures to achieve sufficiency of compliance with Article 1.1.3.2., in particular, the maximum area limitation set out for live/work units.

4. **Provision of the Building Code**

Article 1.1.3.2. Defined Terms

Live/work unit means a dwelling unit that contains a subsidiary business and personal services occupancy or a subsidiary low hazard industrial occupancy, has an area of not more than 150 m^2, and is used and operated by one or more persons of a single household.

Floor area means the space on any storey of a building between the exterior walls and required firewalls including the space occupied by interior walls and partitions, but not including exits, vertical service spaces, and their enclosing assemblies.

5. **Applicant's Position**

The Applicant acknowledged that a literal interpretation of the Code definition of a live/work unit restricts the maximum area to 150 m^2. He argued, however, that this size limit is arbitrary and originated from the former City of Toronto's policy on live/work units, which was intended for single-storey units in loft-style warehouse conversion projects. The subject proposal, he submitted, were not similar to loft spaces at all. Instead, they are very much like standard, three storey residential townhouse condominiums, which require stairs and normally have basements, some of which include parking. He argued that it was problematic to adapt the current OBC live/work area standards to the proposed uses, including the present one, that are evolving in the market.

The Applicant indicated that when the basement and stairs, which he described as unusable space, are excluded then the total area that can be devoted to live/work purposes is approximately 147 m^2. On this basis, he asserted that the subject units meet the intent of the OBC's definition of live/work in the context of a multi-storey building. He also argued that the additional floor area of each unit will not reduce the performance level of the building.

In terms of compensating measures to provide sufficiency of compliance if the interpretive arguments are not accepted, the Applicant argued that the proposed one hour fire-separation separating the work and residential areas provides a certain degree of compartmentation that would contain any fire that originated in the work area. Such separations are not required for live/work units under the Code, he noted.

In summation, the Agent argued that the subject proposal was safe and, in his opinion, met the spirit of the definition of live/work units.

6. **Respondent's Position**

The Respondent submitted that the definition of live/work unit in the Building Code limits such uses to a maximum area of 150 m^2. He indicated that his calculations of the total area of the unit is 187 m^2. As such, he argued that the proposed live/work units exceed the allowable limit by 37 m^2.

The Respondent rejected the arguments posed by the Applicant regarding the exclusion of certain areas from the total area calculation. He noted that the definition of live/work unit did not explicitly state that such unusable areas should be excluded.

Lastly, the Respondent indicated that the subject units can still get built, but that they must not be sold as live/work units. Instead, they must be sold as residential townhouse units or as mixed residential and commercial developments not containing live/work uses. He indicated that the proposal has not been clear as to how the subject units would actually be used, and as a result, how they will get built.

7. **Commission Ruling:**

It is the decision of the Building Code Commission that the proposed live/work units with areas greater than 150 m^2 (including the basement but not including the stairs and garage) do not comply with the requirements of live/work units provided by Article 1.1.3.2. of the Ontario Building Code.

On the issue of sufficiency of compliance, it is the decision of the Building Code Commission that the proposed one hour fire separation separating the work area from the remainder of the live/work units does not provide sufficiency of compliance with the maximum area requirements contained in Article 1.1.3.2. of the Ontario Building Code.

8. **Reasons:**
    i. It is view of the Building Code Commission that the definition of area as it applies to live/work dwellings provided by the Housing Development and Buildings Branch is appropriate. It states that "'area' is intended to count all spaces on any storey of a building between exterior walls and firewalls including the space occupied by interior walls and partitions, where activities related to residential, business and personal service or low hazard industrial occupancies may occur", and in our opinion this includes the basement as well.

ii. The proposed one hour separation of the work area, as a compensating measure to achieve sufficiency of compliance, does not provide adequate fire containment to the point where that space may subtracted from the overall area of live/work.

Dated at Toronto, this 9th day, in the month of December, in the year 1999, for application number 1999-77.

RULING

1. **The Applicant**

   Mr. Brian Crann, President, 1115572 Ontario Inc. O/A Southridge Building Company, Tillsonburg, Ontario has received an order to comply under the *Building Code Act, 1992* to remedy an exterior guard at 49 Trillium Drive, Tillsonburg, Ontario.

2. **Description of Construction**

   The Applicant has recently constructed a new, detached single storey Group C - residential occupancy with a building area of 172 m^2.

   The construction in dispute involves the guard located on a deck at the rear of the house. The guard is composed of vertical pickets supported at the top and bottom by a horizontal rail. Specifically at issue is the height of the bottom horizontal rail, the top of which is measured at 138 mm in height from the surface of the deck. The underside of the rail from the deck surface is 100 mm.

   The subject guard is required since the surface of the deck is more than 600 mm above the adjacent grade level.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether a guard with a bottom rail, measured more than 100 mm to its top, complies with the requirements of the Sentence 9.8.8.5.(1) of the Ontario Building Code. The provision stipulates that guards constructed in residential occupancies shall be designed in a way so that no member, attachment or opening located between 100 mm and 900 mm can be used to facilitate climbing. The guard, as constructed, has a height of 100 mm to the bottom of the lower rail and 138 mm to the top of this rail. At issue therefore is whether the horizontal bottom rail, located within the 100 to 900 mm range specified in Sentence 9.8.8.5.(1), can be considered as a climbable feature of the guard.

4. **Provisions of the Ontario Building Code**

Sentence 9.8.8.5.(1) - Design to Prevent Climbing

(1) Guards required by Article 9.8.8.1. and serving buildings of residential occupancy shall be designed so that no member, attachment or opening located between 100 mm (4 in) and 900 mm (2 ft 11 in) above the floor or walking surface protected by the guard will facilitate climbing.

5. **Applicant's Position**

The Applicant submitted that the as-constructed guard, measuring 138 mm in height from the top of the bottom rail to the porch surface below, complies with Sentence 9.8.8.5.(1) of the OBC. He argued that this provision of the Building Code is intended for situations where a guard design includes another member, attachment, etc., found within the 100 to 900 mm range, besides those required to support the pickets, that could be used for climbing. He stated that he does not believe that the Code can be interpreted as to mean that if the thickness of the bottom rail extends into the 100 to 900 mm range then it is considered climbable. In other words, the 100 mm limitation above the deck should apply to the underside of the rail, not the top. He added that, in his view, Sentence 9.8.8.5.(1) is to be applied where optional design features of a guard may create the opportunity for climbing. In the present case, he noted, the bottom rail is not an optional feature, it is essential to hold the pickets in place.

The Applicant explained that he felt two provisions of the Code were at odds with each other. Specifically, he wondered how it can be possible to have a 100 mm opening under the bottom

rail as allowed under the Code, but at the same time not have a climbable member within the 100 to 900 mm range.

The Applicant also argued that he simply assembled the railing as it was manufactured. He indicated that wood railing manufacturers produce railings to meet the required 900 mm guard height and that the factory produced spindle length dictates how far apart the top and bottom rails are constructed. However, since the spindle length is only approximately 825 mm this makes it necessary to raise the bottom rail in order to meet the overall guard height requirement measured at the top rail. He noted that in his experience such railing production is widespread and if proven not to comply with the OBC then he felt that the manufacturers should be so informed.

6. **Respondent's Position**

The Respondent submitted that the as-built guard on the rear porch does not comply with Sentence 9.8.8.5.(1) of the OBC. He argued that the lower rail is clearly within the 100 to 900 mm range specified in Sentence 9.8.8.5.(1). As a result, he stated that in his view the subject guard is climbable.

The Respondent rejected the Applicant's interpretation that this provision of the Code is intended to prevent the design of guards that include another member, attachment, etc., beyond the lower rail necessary to support the pickets, that could be used for climbing from being located in the indicated range. As he noted, Sentence 9.8.8.5.(1) does not make any suggestion of "another member", it simply says "no member" will be located in the 100 to 900 mm range.

On the issue of manufactured products and building materials that do not meet Code, the Respondent submitted that this is not the first time he has this experience. He stated that railing manufacturers should make their pickets longer so that this situation does not occur.

Lastly, the Respondent indicated that Articles 9.8.8.4. and 9.8.8.5. are critical for life safety in the home. He has sought clarity on these issues over the years. He noted that Appendix A and the Illustrated Guide to the 1997 OBC have helped in this regard. He hoped that the subject hearing would also provide an interpretation on Sentence 9.8.8.5.(1).

7. **Commission Ruling**

It is the decision of the Building Code Commission that the guard with a bottom rail, measured at approximately 138 mm to its top, does not comply with the requirements of Sentence 9.8.8.5.(1) of the Ontario Building Code.

8. **Reasons**

(1) The Ontario Building Code states that a guard shall have no climbable member between 100 mm and 900 mm from the floor surface. A horizontal bottom rail within that range could be used for the purposes of climbing the guard.

RULING

1. **The Applicant**

   Mr. Peter Moy, Peter Moy Architect, Nepean, Ontario has received a building permit under the *Building Code Act, 1992* to renovate an existing structure known as the Carlton Place District Hospital, 211 Lake Avenue East, Carlton Place, Ontario.

2. **Description of Construction**

   The Applicant has recently constructed a new barrier-free access ramp at the main entrance of the Carleton Place District Hospital. The building is described as two storeys in building height (plus basement) and is classified as having a Group B, Division 2 - care and treatment occupancy.

   The subject ramp is approximately 18 m in running length with two 180^0 double back turns. From grade level at the sidewalk to the top of the ramp the height is 915 mm. Adjacent to the ramp is a set of stairs containing six risers.

   The construction in dispute involves the guard built to serve the ramp. The guard consists of a concrete curb running along the entire edge of the ramp that projects 254 mm above the ramp surface. A tubular metal railing with a total height of 865 mm, as measured vertically from the

ramp surface, runs above the curb. A lower tubular metal rail, parallel to the top one and set at 660 mm, also comprises part of the guard. The two rails are supported by tubular metal posts set approximately 0.9 m on centre that are mounted into the curb.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the as built guard, installed on the exterior barrier-free ramp with a maximum height of 865 mm and which includes a lower, parallel rail 660 mm above the ramp surface, provides sufficiency of compliance with Subclauses 3.8.3.4.(1)(f)(i) and (ii) respectively of the Ontario Building Code. Clause 3.8.3.4.(1)(f) stipulates that ramps located in a barrier-free path of travel must have a wall or guard on both sides. In the case where a guard is provided, Subclauses (i) and (ii) set out the requirements regarding height and climbability. Specifically, the height of the guard must be at least 1070 mm as measured vertically from the ramp surface to the top of the guard and the guard must also not be designed in such a way that any member, attachment, etc. between 140 mm and 900 mm above the ramp could facilitate climbing.

4. **Provisions of the Ontario Building Code**

Clause 3.8.3.4.(1)(f) - Ramps<

(1) Ramps located in a barrier-free path of travel shall:

(f) except as provided in Sentence (2), have a wall or a guard on both sides and where a guard is provided the guard shall
(i) be not less than 1070 mm (3 ft 6 in) measured vertically to the top of the guard from the ramp surface; and
(ii) be designed so that no member, attachment or opening located between 140 mm (5? in) and 900 mm (2 ft 11 in) above the ramp surface being protected by the guard will facilitate climbing.

5. **Applicant's Position**

At the outset, the Applicant acknowledged that the subject railings do not meet the prescriptive requirements for guards found in OBC 3.8.3.4.(1)(f). Nevertheless, the ramp design was not intended to meet these standards because, in his interpretation, a guard is not required under the Building Code. He based this view on the design of the ramp which, when examined in cross-section, shows that between the entrance level at the top, the three differing levels of the ramp (as it doubles back) and the sidewalk level, there is no vertical drop of more than 600 mm. The principle of not requiring a guard where there is less than a 600 mm difference in elevation between a ramp and its adjacent surface is established in Sentence 3.4.6.5.(3), the Applicant noted. The ramp, he argued, serves as an exit, and it was the exit requirements found under OBC Subsection 3.4.6. "Types of Exit Facilities" according to which the ramp was designed.

In addition, the Applicant noted that the CSA Standard, CAN/CSA-B651-95, "Barrier-Free Design" makes no specific mention of guards at ramps, which he argued implies that guards should not be construed as a specific need of physically challenged individuals. Guards as they apply to ramps, he asserted, should be done in accordance with usual exit facility requirements. In the instance at hand a guard is not necessary, only a railing. And in the present design, far more than a railing was included, he noted.

The Applicant also argued, using a previous decision, that the BCC has in the past (1996) allowed a ramp without guards where the difference between the ramp and adjacent surface was less than 100 mm.

Assuming a guard was required, the Applicant then offered arguments regarding the three specific aspects of the disputed construction; penetrability, climbability and height, of which the safety has been questioned. Prior to this, however, he indicated that the as built railing is safe and does not pose a hazard to the public, both able bodied and physically challenged.

On the issue of penetrability, the Applicant noted that between the curb and the lower rail and between the vertical posts there are openings measuring 360 mm by 838 mm respectively. Handicapped individuals, the principle users of the ramp, would not be able to fall through this opening, he argued. Moreover, the vertical drop, if someone were to fall, is not a significant height. In the Applicant's view, therefore, penetrability is not a serious concern.

Regarding the aspect of climbability, the Applicant argued that the guard was not an attractive feature to climb for children. However, any child that has the dexterity to mount the curb and duck under the lower rail has the ability to manage themselves well and do not need legislation to protect them. Certainly, handicapped persons would not attempt climbing, he stated.

The Applicant recognized that, if viewed as a guard, the height does not comply. Nevertheless, he argued that the ramp was not an area where people would linger. They would simply use it to pass through, thereby reducing the danger of a lower guard.

Lastly, the Applicant stated that he thought that the Code is moving away from common sense and has become too rigid. Alternative designs should be allowed and encouraged. The subject ramp, he reiterated, is safe and will benefit the ambulatory and non-ambulatory public.

6. **Respondent's Position**

The Respondent submitted that while the subject ramp, in his view, does not present a danger to the public and complies with the OBC standards for exits, it does not meet the barrier-free path of travel requirements for guards as found in Clause 3.8.3.4.(1)(f). In particular, he noted that the height of the guard, at 865 mm, did not meet the required 1070 mm and that the lower rail, at 660 mm, must be considered a climbable member. He declined to comment on the issue of the penetrability of the guard.

The Respondent concluded by indicating that he hoped to learn from the Commission whether a guard was required in this instance.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the as built guard, installed on the exterior barrier-free ramp with a maximum height of 865 mm and which includes a lower, parallel rail 660 mm above the ramp surface does not provide sufficiency of compliance with Subclauses 3.8.3.4.(1)(f)(i) and (ii) respectively of the Ontario Building Code at the Carleton Place District Hospital, 211 Lake Avenue East, Carleton Place, Ontario.

8. **Reasons**

1) Adequate compensating measures have not been provided.

2) Guards are required for barrier-free ramps regardless of differences in elevation.

3) The guard height of 865 mm does not meet the requirement of 1070 mm.

4) The design of the guard offers opportunities for climbing.

Agent for the Applicant

RULING

1. **The Applicant**

   Mr. Clare Warmsteeker, Manager, Physical Plant, Brantwood Residential Development Centre, Brantford, Ontario, has received a building permit under the *Building Code Act, 1992* and is currently constructing a group home known as the St. Paul Avenue Group Home, 485 St. Paul Avenue, Brantford, Ontario.

2. **Description of Construction**

   The Applicant is currently constructing a new care facility intended as a group home for a maximum of seven persons. The Building is described as one storey (with a partial basement and a separated crawl space) in building height, 363.5 m^2 (excluding carport) in building area, and is of combustible construction. The building is classified as having a Group B, Division 3 - (group home) care occupancy under the 1997 Ontario Building Code. The structure will not be equipped with a fire alarm system, but will be supplied with a hard-wired interconnected smoke detection system complete with two pull stations and a sprinkler system. The group home will also have five means of egress direct to the exterior at grade level.

   The main floor of the subject building is to contain a total of seven bedrooms arranged in a U-shaped configuration on the east, south and west facing walls. Bathroom facilities, a living room, a dining room and a kitchen are to occupy the remainder of the ground floor. The partial basement will contain a storage room and mechanical and electrical equipment room. The separations provided in the floor assembly between the basement (but not the crawl space) and ground floor, and in the wall assemblies between the bedrooms and the rest of the ground floor

and between the individual bedrooms themselves will have a 3/4 hour fire-resistance rating. The floor assembly of the crawl space has not been separated due to the fact that the crawl space is not to be used as a plenum and any flues will be fully ducted.

The seven group home residents are to be supervised 24 hours a day with 3 full time staff members present during working hours and 4 full time employees during the evening. After midnight one awake staff will be on duty throughout the night and will be backed up by a roving supervisor who is to drop in periodically. In case of an emergency, three residents would need assistance to evacuate.

The construction in dispute involves the proposed sprinkler system. The Applicant is proposing that the sprinkler system be designed and installed in accordance with the requirements of NFPA 13R, "Standard for the Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height."

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the proposed sprinkler system, design according to the NFPA 13R standard, and intended for use in a Group B, Division 3 occupancy, achieves sufficiency of compliance with Article 3.2.2.41. and Sentences 3.2.5.13.(1) and 3.2.5.13.(2) of the Ontario Building Code. Article 3.2.2.41. requires that a B3 occupancy must be sprinklered even though it may be of combustible construction. The dispute therefore centres on the type of sprinkler system that is required.

Sentence 3.2.5.13.(1) states that a required sprinkler system must meet NFPA 13, whereas Sentence 3.2.5.13.(2), provides an exception to Sentence (1) by allowing low rise (four stories or less) residential occupancies to comply with the more relaxed sprinkler standards found in NFPA 13R. Specifically, the NFPA 13 standard requires that all spaces of a building be protected with sprinklering. This includes unoccupied areas of the building such as closets and concealed spaces such as attics and crawl spaces. The NFPA 13R standard, however, stipulates that such a sprinkler system need only be designed and installed for all occupied rooms.

Certain buildings classified as having a B3 occupancy are permitted under Article 3.1.2.5. to be considered as residential occupancies with conditions. The first condition is that the occupants operate as a single housekeeping unit and that there is sleeping accommodation for no more than

ten persons. Only seven bedrooms are proposed for the subject building and since the rooms are not equipped with cooking facilities it is conceivable that it may be considered as a single housekeeping unit. The second condition is that not more than two persons would require assistance to evacuate in case of an emergency. As the Applicant has noted, three occupants would require assistance in an emergency. As a result, the subject building cannot be considered as having a residential occupancy as per Article 3.1.2.5.

At issue therefore, is whether the proposed building offers any compensating measures to achieve sufficiency of compliance with Article 3.2.2.41. and Sentence 3.2.5.13.(1), which require that the sprinkler system be built according to NFPA 13.

4. **Provisions of the Ontario Building Code**

Article 3.2.2.41. - Group B Division 2 or Division 3, One Storey, Sprinklered

(1) A building classified as Group B, Division 2 or Division 3 is permitted to be of combustible construction or noncombustible construction used singly or in combination, provided

(a) except as permitted by Sentence 3.2.2.7.(1), the building is sprinklered;
(b) it is not more than 1 storey in building height; and
(c) it has a building area not more than 500 m2 (5,380 ft2).

Article 3.2.5.13. - Automatic Sprinkler Systems

(1) Except as permitted by Sentences (2), (3) and (4), an automatic sprinkler system shall be designated, constructed, installed and tested in conformance with NFPA 13, "Standard for the Installation of Sprinkler Systems".

(2) Instead of the requirements of Sentence(1), NFPA 13R, "Standard for the Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height", is permitted to be used for the design, construction, installation and testing of an automatic sprinkler system installed in a building of residential occupancy that is not more than 4 storeys in building height.

Article 3.1.2.5. - Group B, Division 3 Occupancies

(1) Group B, Division 3 occupancies are permitted to be classified as Group C major occupancies provided: (a) the occupants live as a single housekeeping unit in a dwelling unit with sleeping accommodation for not more than 10 persons; and
(b) not more than 2 occupants require assistance in evacuation in case of an emergency.

5. **Applicant's Position**

At the outset, the Agent for the Applicant indicated that has been to the Building Code Commission numerous times over the past year representing similar projects to the one at hand, and since the dispute centred on the same issue he would be making similar arguments as before.

Prior to discussing the technical issues, however, the Agent indicated that he had some general comments about the issue of determining a B3 occupancy with the fundamental shift of care provision for certain challenged individuals from large institutional settings to smaller home-like environments, providers of such care have found some difficulty in using the B3 occupancy. They are finding it too broad and seems to fit a larger building better. Moreover, there is not definition of group homes in the Ontario Building Code. Adding to the confusion, the Agent noted is that a group home can be interpreted as meeting both the definition of care and residential occupancies. The government's response to the Meadowcroft retirement, i.e., in part, the creation of the BC occupancy home was so wide-sweeping that it caught even very small group homes. The B3 occupancy to date, has not provided much flexibility and seems out of sync with the current trends of this type of care provision. Turning his attention to the technical issues.

The Agent acknowledged that while strictly speaking it was not possible to consider the subject building as a residential facility under Article 3.1.2.5. because more than two residents would require assistance in an emergency, he submitted that the care occupancy currently under construction should still be considered as residential occupancy. The Agent argued that the subject group home will operate as a single house-keeping unit with a family like environment. He also argued that the home physically resembles a house from both the exterior, with its small size, and interior, with its homelike floor plans. He noted that the construction techniques are also residential in nature. In his view, it was not the intent of the 1997 OBC to require the more onerous NFPA 13 sprinkler standard for such small buildings of residential character and function. He suggested that smaller facilities (as measured by their floor area or occupant load) in the B3 classification be allowed to comply with NFPA 13R standard for sprinkler protection.

All occupied rooms would be sprinklered, which, he noted, is far more fire protection than is required of the average house.

In terms of compensating measures to achieve sufficiency of compliance with Sentence 3.2.5.13.(1), the Agent noted that the fire separations to be provided between the common areas and the bedrooms and between the individual bedrooms are not required by Code and would offer a higher level of containment than standard construction. These additional separations would act as a direct compensating measure to offset the lesser sprinkler protection provided under NFPA 13R.

The Agent also argued that the hard-wired interconnected smoke detection system would increase the fire safety of the house. He explained that the smoke detectors would be installed (beyond Code requirements) throughout the house, including in some concealed areas such as the crawl space, i.e., among the areas where sprinklers would be necessary under NFPA 13. The Agent indicated that the presence of additional detection would mean that fire in such areas would not go unnoticed and due to early warning would therefore pose no threat to the occupants. Moreover, he added that two manual pull stations, which are also not required, are to be installed and connected to the smoke detection system.

The last major area in which compensating construction is proposed the Agent noted, is the number of egress facilities. He indicated that the Code requires only two exits for a building of this size. The subject structure, however, is proposed to have five exits that will lead directly to the exterior at grade level. This would provide numerous escape options and would directly compensate for the fact that three residents would require assistance to exit in an emergency. As a result, the Agent argued that the overall exiting time would be comparable to a situation in which there were two residents that needed assistance and only two exits.

In response to questions raised during the hearing, the Applicant also offered to provide a connected heat detector in the attic and sprinkler (as per NFPA 13R standards) in the crawl space.

Finally, the Agent stated that the above compensating measures and the NFPA 13R sprinkler system would offer the same level of fire safety for the residents of the proposed group home without relying upon the more rigorous and expensive NFPA 13 sprinkler requirements.

6. **Respondent's Position**

The Respondent chose not to attend the hearing. The Commission therefore relied upon his written submission only.

The Respondent submitted that the subject care home is not a residential facility and thus the sprinkler system should be designed and installed according to NFPA 13. The building at hand, he argued, would contain more than two people who would require assistance to evacuate in an emergency. As a result, the subject building does not meet the criteria found in Article 3.1.2.5. of the 1997 Ontario Building Code that allows a care facility to be considered as having a residential occupancy. Therefore, in the Respondent's view, a care occupancy must conform with NFPA 13 standards for sprinkler design and installation.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the proposed sprinkler system, designed according to NFPA 13R, provides sufficiency of compliance with Article 3.2.2.41. and Sentences 3.2.5.13.(1) and (2) of the Ontario Building Code at the St. Paul Avenue Group Home, 485 St. Paul Avenue, Brantford, Ontario on the condition that:

i. Fire detectors are provided in the attic, basement, crawl space and carport/garage;
ii. The two pull stations are interconnected with the smoke detection system;
iii. The proposed level of fire separations be constructed;
iv. Five exits are provided; and,
v. Sprinklers, designed according to NFPA 13R, are installed in all occupied areas of the building including closets and the crawl space.

8. **Reasons**

(a) With conformance to the above conditions, the Commission is satisfied that the proposed sprinkler system does not represent an increased hazard to life safety.

(b) The building will be a non-smoking facility.

(c) Staff will receive safety training and fire training, which includes fire drills to be carried out.

(d) Adequate staff will be provided to accommodate the physical condition of the residents.

RULING

1. **The Applicant**

   Mr. John and Shirley Smith, Ontario, have received an order to comply under the *Building Code Act, 1992,* to remedy certain deficiencies concerning the guards at 16 Andrew Street, Arthur, Ontario.

2. **Description of Construction**

   The Applicant's have recently constructed a new, two storey, detached Group C - Residential structure with a building area of approximately 350 m^2. Two separate decks with a total length of approximately 18.3 m have been constructed on the ground floor of the east and south sides of the house.

   The construction in dispute involves the guards built around the perimeter of both decks. The wood guards consist of numerous joined members inclined at 45° supported at the sides, top and bottom by vertical and horizontal rails. The grade level beyond the deck in terms of vertical height varies from approximately 350 mm to 1100 mm as measured from the deck surfaces. While the areas where the grade level is 600 mm or less do not require a guard to be constructed on the deck, the Applicant's have chosen for aesthetic reasons to continue the same guard design for these areas as well.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the as constructed guard, which includes numerous joined diagonal members, provides sufficiency of compliance with Sentence 9.8.8.5.(1) of the Ontario Building Code. This provision stipulates that a required guard be designed so that no member, attachment or opening located between 100 mm and 900 mm above the floor or walking surface, here the surface of the deck, will facilitate climbing. The rationale for this requirement is provided in the Appendix note for Sentence 9.8.8.5.(1) which states that:

"Guards are sometimes constructed with horizontal or near-horizontal members between balusters such that a ladder effect is achieved; this can be very tempting for young children to climb, thus exposing themselves to risk of falling over the guard..."

At issue therefore is whether the design of the as constructed guards facilitates climbing.

4. **Provisions of the Ontario Building Code**

Sentence 9.8.8.5.(1) - Design to Prevent Climbing

(1) Guards required by Article 9.8.8.1. and serving buildings of residential occupancy shall be designed so that no member, attachment or opening located between 100 mm (4 in) and 900 mm (2 ft 11 in) above the floor or walking surface protected by the guard will facilitate climbing.

5. **Applicant's Position**

The Agent for the Applicant submitted that the as built guards do not pose a hazard and should be considered as being in compliance with the requirements of Sentence 9.8.8.5.(1). He noted that the vertical height of the deck above the adjacent grade level was relatively low, in fact, certain portions of the guards are not even required by Code since the vertical drop is less than 600 mm. As well, the surface of the adjacent grade is comprised of soft soil and grass. It is not concrete or some other hard surface. He also noted that there are no children living in the house that would be tempted into climbing the subject guards.

The Agent presented examples of other guards, some located in Ontario and some not. Among the examples of other guards found elsewhere in Ontario were ones at the Elora Gorge and at Niagara Falls. He argued these were far more dangerous and climbable than the one built at the Smith residence. The Agent also offered examples of guards very similar in design to those in

dispute. He noted that these must have been approved by the relevant authority having jurisdiction, and that while some of these guards were located in the US and therefore subject to different building codes, at least one was found in Queenston, Ontario.

The Agent explained that the situation regarding the guards arose due to the following circumstances: Prior to constructing the decks the he took a prototype design of the proposed guards to the municipal building department for review. The officials there allowed that the proposed design would not be deemed to facilitate climbing if the interior (or deck side) of the guards were covered with plexiglass or some other type of screening. However, once constructed the Applicants decided that the guards do not pose a hazard and would be reduced aesthetically if a screening material were to be added.

In conclusion, the Agent stated that the owners of the house have run their own family insurance business for many years and are aware of the legal requirements that have been established for the safety of a household and its residents. Nevertheless, in their opinion, they do not believe the guards pose a safety risk to anyone.

6. **Respondent's Position**

The Respondent choose not to attend the hearing. The Commission therefore relied upon his written submission only.

The Respondent submitted that the Applicant's as constructed guards, in his view, would facilitate climbing. As a result, he argued that Sentence 9.8.8.5.(1) of the Code has not been met. It was for this reason, he indicated, that an order to comply was issued.

The Respondent stated that he offered to take a four year old child to the house to ascertain whether the guard was climbable. The Applicant's declined, but in doing so conceded that the subject guards could be deemed as climbable.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the as constructed guard consisting of numerous joined diagonal members does not provide sufficiency of compliance with Sentence 9.8.8.5.(1) of the Ontario Building Code at 16 Andrew Street, Arthur, Ontario.

8. **Reasons**

(i) No compensating measures to achieve sufficiency of compliance were provided.

Dated at **Toronto** this **18th** day in the month of **November** in the year **1999** for application number **1999-71**.

RULING

1. **The Applicant**

   Mr. Victor Heinrichs, Ontario, has received an order to comply under the *Building Code Act, 1992* to remedy certain deficiencies regarding the as built stairways within three of the recently constructed residential units at Luther Village West - Block A, 1 Sunshine Avenue, Waterloo, Ontario.

2. **Description of Construction**

   The Applicant has recently constructed a townhouse complex consisting of seven buildings (Blocks A to F [Block A contains two buildings separated by a firewall]). Blocks A and B contain model units known as the "Lilac" and "Iris" suites, both of which come in two versions, a one storey unit and a one storey with loft unit. The ground floor area for these units is approximately 150 m^2, with the lofts having roughly 35 m^2 of floor area.

   The construction in dispute involves three of the seven newly constructed, and occupied, two storey Lilac and Iris units in Block A, which is described as combustible construction, two stories in building height, 900m^2 in building area and having a Group C (townhouse condominium) residential occupancy. Specifically at issue is the width of the single stair serving the loft area. The stairs of these three units have a clear width of 813 mm between wall faces,

and only 711 mm between the wall and the projecting handrail. The subject stairs run straight and begin in the foyer of the main floor and terminate to the side of the loft area.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the as constructed single stair serving a second storey loft measuring 813 mm in width between wall faces provides sufficiency of compliance with Sentence 9.8.3.3.(2) of the Ontario Building Code. This provision stipulates that at least one stairway between each floor level in a dwelling unit should have a width of not less than 860 mm between wall faces. Minimum width requirements are established in the Building Code so that stairs will be able to serve the double function of allowing for the movement of people, in particular as a means of egress for occupants if required, and the movement of furniture. The stairways at issue have a clear width of only 813 mm between wall faces, which in turn has been reduced to 711 mm by a handrail fixed on one side of the stair. Sentence 9.8.7.6.(1), it should be noted, allows handrails to project up to 100 mm into the required width of a stair.

4. **Provisions of the Ontario Building Code**

Sentence 9.8.3.3.(2) - Stair Width

(2) At least 1 stairway between each floor level in a dwelling unit shall have a width between wall faces of not less than 860 mm (2 ft 10 in).

5. **Applicant's Position**

The Applicant submitted that the width of the as built stair provides sufficiency of compliance with the minimum stair width of 860 mm as specified in Sentence 9.8.3.3.(2). He argued that the OBC allows an exit stair under Clause 3.4.3.1.(2)(b) to have a minimum width of 900 mm, which can be further reduced to 700 mm by the encroachment of handrails on both sides that are permitted to project into the required width by 100 mm each. Thus, for exit purposes the Code allows a clear width of 700 mm between handrails. In the present situation, the clear width between the single handrail and the opposite wall is 711 mm, he noted. Further, a minimum width of 660 mm is permitted as a means of egress for a spiral stair serving a floor area with an occupant load of not more than five persons under NFPA 101, Section 5-2.2.2.4.

Moreover, the Code also allows doors in the exit path to be narrower than the 860 mm required in Sentence 9.8.3.3.(2).

If one were to examine the situation based on the relationship between occupant load and width of the exit, the stairs would be more than adequate, the Applicant also argued. He indicated that a 700 mm wide exit stair is permitted to serve an occupant load of 76 persons, however the 35 m^2 loft has only 17 m^2 useable space which, based on 0.95 m^2 /p, would equate to an occupant load of 18 people. Nevertheless, he noted that if the loft is classified as a bedroom then the OBC would determine the occupant load to be 2 persons. The Applicant did acknowledge, however, that in most residential suites the width of an interior stair is governed by the occupant load.

The Applicant indicated that it was interesting to note that the wording of Sentence 9.8.3.3.(2) refers to "at least one stairway" and "between wall faces" which is different from the text used in Part 3 which describes width of exits. While he conceded that the as built stair does not meet the prescriptive width requirements of Sentence 9.8.3.3.(2), he argued, based on the above discussion, that if they were viewed as an exit and not as a "stairway" then the width requirements and thus the exit standards have been met. The Applicant therefore indicated that for Sentence 9.8.3.3.(2) at least, the intent of the Code's minimum dimensions relates more to a functional requirement with respect to the movement of furniture and/or equipment and not the egress of people.

Concerning the movement of furniture, he argued that since the subject stairs have a straight run they provide an easier path for the transportation of furniture than stairs that contain a bend. In addition, the Applicant argued that because the lofts overlook the living/dining rooms below this would allow large furniture and equipment to be lifted over the guards through the openings from the floor levels below without using the stairs.

Finally, the Applicant stated that it would be exceedingly difficult to remedy this situation to widen the stairs.

Based on the above considerations, the Applicant concluded by stating that, in his view, the subject stairs provide sufficiency of compliance with Sentence 9.8.8.3.(2).

6. **Respondent's Position**

The Respondent submitted that the stair widths in the subject two storey units do not meet the minimum width of 860 mm from wall face to wall face as required by Sentence 9.8.3.3.(2) of the

Building Code. He noted that the as constructed width is 813 mm. The municipality's position is that it cares not whether the Code standard is for the movement of people or furniture. The Code requirement is clear.

The Respondent also indicated that the plans submitted and approved by the municipality showed a stair width in conformance Sentence 9.8.3.3.(2). The deficient width was only discovered during an inspection in the latter stages of construction.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the single stair serving a second storey loft measuring 813 mm in width between wall faces provides sufficiency of compliance with Sentence 9.8.3.3.(2) of the Ontario Building Code at Block A - Luther West Village, 1 Sunshine Avenue, Waterloo, Ontario.

8. **Reasons**
   - i. The current stair width will not pose a life safety problem.
   - ii. The loft is a small area and if large furniture is required it can be lifted over the openings to the loft.
   - iii. The problem is limited to three units of a 70 unit complex and was corrected as soon as it was made known.

RULING

1. **The Applicant**

   Ms. Sheila O'Donovan, owner, Lisaard House Charitable Foundation, Cambridge, Ontario has applied for a building permit under the *Building Code Act, 1992* to construct a new palliative care facility for cancer patients known as the Lisaard House, at 950 Speedsville Road, Cambridge, Ontario.

2. **Description of Constrution**

   The Applicant is proposing to construct a new care facility intended as a hospice for the use of patients terminally ill with cancer. The building is described as one storey in building height (with a partial basement and two separated crawl spaces), 562 m^2 in building area, and is of combustible construction. The building is classified as having a Group B, Division 2 (care and treatment) occupancy under the 1997 Ontario Building Code. The structure will not be equipped

with a fire alarm system, but will be supplied with a hard-wired interconnected smoke detection system and a sprinkler system.

The building is to have a total of six bedrooms, each with their own bathroom facilities. The bedrooms are arranged on the outer side of a ring corridor, the centre of which contains a nurses station, administrative offices and a bathing facility. The building is also to contain a kitchen/dining area, several lounges and a reception room. Storage space and mechanical and electrical equipment will be located in the partial basement. A total of five exits that lead directly to the exterior at grade level are proposed for the hospice. As well, each of the six bedrooms will have a set of inward swinging, double-leaf doors that also lead directly to the exterior.

The separations provided in the floor assembly between the basement and ground floor, and in the wall assemblies between the individual bedrooms and between the bedrooms and the ring corridor will have a 3/4 hour fire-resistance rating. The floor assembly above the crawl space has not been separated due to the fact that it will not be used as a plenum and any flues will be fully ducted.

The building is intended for six cancer patients. Staff will be present in the facility 24 hours a day. During the day the staffing level will be up to 3 or 4 full time persons, including home care nurses that are to drop by on a periodic basis. This number is to be reduced to two overnight, with one of these being a practical nurse. A senior physician that also acts as a house manager will be present at all times. In case of emergency, some persons (depending on the health of residents at the time of the emergency) would require assistance to evacuate.

Since the residents of the proposed building will be persons in the final stages of life, they would have abandoned most treatment. Some medication will be provided, however, but this would only be to reduce suffering and make the residents more comfortable. In many cases, patients will be equipped with pain pumps in order to administer medication themselves. Staff is available in this regard if needed. The average length of stay for the residents will be approximately three to four weeks.

The construction in dispute involves the proposed sprinkler system. The Applicant is proposing that the sprinkler system be designed and installed in accordance with the requirements of NFPA 13R, "Standard for the Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height." (The Applicant is proposing, however, that the entire ground floor of the building be supplied with sprinkler protection conforming to NFPA 13, which would include concealed spaces such as closets and all washrooms [even those less than 5.1 m^2].)

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the proposed sprinkler system, designed according to NFPA 13R, and intended for use in a Group B, Division 2 occupancy provides sufficiency of compliance with Article 3.2.2.40. and Sentence 3.2.5.13.(1) of the Ontario Building Code.

Article 3.2.2.40. requires that a B2 occupancy must be sprinklered even though it may be of combustible construction. Sentence 3.2.5.13.(1) states that a required sprinkler system must meet NFPA 13, whereas Sentence 3.2.5.13.(2), provides an exception to Sentence (1) by allowing low rise (four stories or less) residential occupancies to comply with the more relaxed sprinkler standards found in NFPA 13R. Specifically, the NFPA 13 standard requires that all spaces of a building be protected with sprinklering. This includes unoccupied areas of the building such as closets and concealed spaces, for example, attics and crawl spaces. The NFPA 13R standard, on the other hand, stipulates that such a sprinkler system need only be designed and installed for all occupied rooms.

Nevertheless, since the subject building is classified as a B2 occupancy under the 1997 OBC the sprinkler system must be installed in accordance with NFPA 13 standard, not NFPA 13R. This is due to the fact that the structure cannot be considered as having a residential occupancy. While certain buildings classified as having a Group B occupancy are permitted to be considered residential occupancies in the appropriate circumstances and under various conditions, this particular building does not qualify as such for several reasons.

First, residential consideration of a Group B occupancy is only available for B3 buildings under certain conditions as set out in Article 3.1.2.5. Because the residents will require treatment, albeit limited, the Commission regards the hospice as classified as a B2 occupancy. Further, some of the treatment at the facility will be administered by qualified medical personnel. Secondly, even if the proposed building were classified as B3, it is doubtful that it would meet the conditions stipulated in Article 3.1.2.5. These conditions are that the occupants operate as a single housekeeping unit, that there is sleeping accommodation for no more than ten persons and that no more than two persons would require assistance to evacuate in case of an emergency.

On the first two items, it is recognized that the hospice, with only six proposed bedrooms, is small, and since these individual sleeping rooms are not to be equipped with cooking facilities it

is conceivable that the facility could operate as a single housekeeping unit. Regarding the issue of assistance in an emergency, however, it is not clear how this condition would be met on a consistent basis, especially considering the deteriorating health of the residents. This is, after all, a cancer hospice for terminally ill patients, and while at times no more than two people would require assistance to evacuate, there would certainly be other occasions where more than two would need help. There would be no way to enforce such a condition either. To do so would be inconsistent with the purpose of the facility, which is to give dying cancer patients the dignity and comfort they deserve. As a result, the subject building, if classified as a B3 occupancy, could not be considered as residential as per Article 3.1.2.5.

At issue therefore, is whether the proposed B2 building offers any compensating measures to achieve sufficiency of compliance with Article 3.2.2.40. and Sentence 3.2.5.13.(1), which require that the sprinkler system be built according to NFPA 13.

4. **Provision of the Building Code**

Article 3.2.2.40. - Group B, Division 2 or Division 3, up to 2 Storeys, Sprinklered

(1) A building classified as Group B, Division 2 or Division 3 is permitted to conform to Sentence (2) provided:
(a) except as permitted by Sentence 3.2.2.7.(1), the building is sprinklered;
(b) it is not more than 2 storeys in building height; and
(c) it has a building area not more than: (i) 2,400 m^2 (25,800 ft^2) if 1 storey in building height; or (ii) 1,600 m^2 (17,200 ft^2) if 2 storeys in building height.**(2)** The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination; and
(a) floor assemblies shall be fire separations with a fire-resistance rating not less than 45 min,
(b) mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min; and
(c) loadbearing walls, columns and arches shall have a fire-resistance rating not less than that required for the supported assembly.

Sentences 3.2.5.13.(1) and (2) - Automatic Sprinkler Systems

(1) Except as permitted by Sentences (2), (3) and (4), an automatic sprinkler system shall be designed, constructed, installed and tested in conformance with NFPA 13, "Standard for the Installation of Sprinkler Systems". (See Appendix A.)

(2) Instead of the requirements of Sentence (1), NFPA 13R, "Standard for the Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height", is permitted to be used for the design, construction, installation and testing of an automatic sprinkler system installed in a building of residential occupancy that is not more than 4 storeys in building height.

Article 3.1.2.5. - Group B, Division 3 Occupancies

(1) Group B, Division 3 occupancies are permitted to be classified as Group C major occupancies provided:
(a) the occupants live as a single housekeeping unit in a dwelling unit with sleeping accommodation for not more than 10 persons; and
(b) not more than 2 occupants require assistance in evacuation in case of an emergency.

5. **Applicant's Position**

Prior to submitting arguments about sufficiency of compliance, the Applicant described the project and its purpose and why in her view it could still be considered residential (and possibly a B3, and not a B2, occupancy). She argued that the building, set on a large rural lot, is designed to create a homelike environment where families would be encouraged to stay as long as they wanted. She noted that the residents would not be "supervised" insofar as the Code uses that concept. As well, there would most likely not be more than two persons requiring assistance to evacuate in an emergency. She also noted that the level of medication that residents would receive would be no more than they would get in their own homes. Anyone needing more treatment than this would have to return to the hospital.

At the outset of his presentation, the Agent for the Applicant indicated that he had recently been to the Building Code Commission on six previous applications regarding similar projects. In his view, the subject building, consistent with his previous BCC applications, could appropriately be considered as a B3 facility (and under Article 3.1.2.5. as having a residential occupancy) under the OBC, thereby allowing the proposed NFPA 13R sprinkler system to be installed. The Agent

argued that the subject group home physically resembles a house from both the exterior, with its small size, and interior, with its homelike floor plans. He noted that the construction techniques are also residential in nature. It was not the intent of the 1997 OBC to require the more onerous NFPA 13 sprinkler standard for such small buildings of residential character and function.

If the proposed hospice could not be considered as a B3 or residential occupancy, however, the Agent offered various compensating measures beyond minimum construction requirements to achieve sufficiency of compliance with the OBC. Specifically, he noted that the interconnected, hard-wired smoke detection system proposed for not only the occupied areas but also areas such as the crawl spaces goes beyond minimum Code requirements. He argued that while there may be no suppression of fire in spaces such as the crawl spaces, there will be a detection system to provide early warning. The Agent also indicated that the proposed wall assembly separations are not required by Code. Such separations, he asserted, would provide a higher level of fire compartmentation than normally found in a building of this size. He argued that the separations provide clear and direct compensation to the omission of sprinklers from certain areas. As well, the Agent noted that the number of exits serving the building, in addition to the six access doors in the bedrooms, provides a level of exiting far in excess of Code requirements.

Considering that the ground floor would be sprinklered (according to NFPA 13), that fire separations would be provided between floors and bedrooms, that hard-wired interconnected smoke detectors would be installed in most areas of the hospice, and that evacuation would be quick, the Agent stated that the life safety of the residents would be adequately protected without relying upon the more rigorous NFPA 13 requirements for the entire building.

Lastly, the Agent indicated that, in his view, the primary benefit of installing a fully compliant NFPA 13 sprinkler system would be enhanced property protection. He stated that with respect to the subject cancer hospice he has tried to focus his design efforts on cost effective life safety features.

6. **Respondent's Position**

The Respondent submitted that the subject cancer hospice should be classified as a B2 - care and treatment - occupancy. As a result, he indicated that, in accordance with Article 3.2.2.40., the proposed hospice was required to be sprinklered in conformance with NFPA 13. He rejected the Applicant's arguments that the building could be viewed as a B3 or even a residential use. As he

noted, the intended purpose of the structure is to provide comfort and treatment to dying cancer patients.

The Respondent also rebuffed the Agent's arguments that the present application to the Building Code Commission was analogous to his previous ones. Those buildings were much smaller in area and were subject to the construction requirements of Article 3.2.2.41. Moreover, as group homes, a credible argument could be made that most of the residents of the Agent's earlier projects were ambulatory. This is not the case in the present situation, the Respondent argued. Regardless, he stated that he was aware that the Commission was not bound by their previous decisions and viewed each issue on a case-by-case basis.

Nevertheless, the Respondent did state that he was sympathetic to the Applicant's proposal and the dilemma facing them with respect to their classification under the OBC. He also added that while he supported the proposed compensating measures, in particular those relating to enhanced early warning and upgraded compartmentation offered by the Agent, he felt he did not have the authority to accept such a deviation from Code.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the proposed sprinkler system intended to serve a B2 occupancy does not provide sufficiency of compliance with Article 3.2.2.40. and Sentence 3.2.5.13.(1) of the Ontario Building Code at the Lisaard House, 950 Speedsville Road, Cambridge, Ontario.

8. **Reasons**

1) As a building of care and treatment, i.e., a B2 occupancy, the sprinkler system must be designed, constructed, installed and tested in conformance with NFPA 13.

2) While certain compensating measures were proposed, they were not adequate to achieve the same level of protection offered by fully sprinklering the building.

RULING

1. **The Applicant**

   Mr. D. W. Durant, Plant Services Controller, District School Board of Niagara, St. Catharines, Ontario has received an order under the *Building Code Act, 1992*, to address certain deficiencies in an addition to the South Lincoln High School, 260 Canborough Road, Smithville, Ontario.

2. **Description of Construction**

   The Applicant has recently constructed an addition onto an existing high school. The addition contains extra classroom space, a gymnasium, staff offices, changerooms and a sound and lighting booth overlooking the gymnasium. The existing building had a building area of 3,300 m^2, and together with the 2,077 m^2 addition, the total building area of the current structure is 5,377 m^2. The building is further described as having a Group A, Division 2 - (high school) assembly occupancy, one storey in building height, and is of noncombustible construction. It is equipped with a sprinkler system and fire alarm system.

   The construction in dispute involves the small (6.5 m^2) sound and lighting booth that overlooks the new gymnasium. In order to function effectively as a room to control sound and lighting for theatre arts productions, the booth was constructed in the opposite wall from the stage and on top

of the single storey phys. ed. staff offices that adjoin the gymnasium. The booth is accessible only through an access hatch complete with a pull down ladder that is located in the phys. ed staff offices. When the booth is not in use, the ladder is pushed up and out of the offices below and the access hatch is closed. (Currently, the access hatch has been removed due to a hardware problem.) A door leading directly to the roof is provided within the booth. The parapet around the building's perimeter extends 750 mm above the level of the roof.

The addition to the building is designed to accommodate a future second floor which would incorporate the recently built sound and lighting booth. When the second floor is constructed, there will be direct access to the sound and lighting booth from the second storey corridor, which in turn will be served by two separate exit stairs.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the second storey sound and lighting booth, as constructed, with a pull down ladder and a lockable access hatch provides sufficiency of compliance with Article 3.4.1.1. and Sentence 3.3.1.13.(1) of the Ontario Building Code.

The first provision stipulates that an exit facility for a floor area intended for occupancy must comply with the exit standards of Section 3.4. of the Building Code, including the dimensional, guards and handrails requirements. Further, Article 3.3.1.13., in particular Sentence (1), states that except under a few circumstances ramps and stairs shall also conform to Section 3.4. Sentence (2) of that Article, however, is an exception. It states that ramps and stairs that serve service rooms and spaces and industrial occupancies and that are used infrequently need not comply with Sentence (1) and thereby Section 3.4.

The definition of a service room as found in Article 1.1.3.2. of the OBC is found below. It indicates that to be considered a service room, a space must contain equipment associated with the building services, such as heating, air conditioning or electrical equipment. It also states that such rooms are usually separated by an increased level of fire separation from the rest of the building. A room dedicated to the control of sound and light of a theatre production cannot be considered as an area devoted to containing building services equipment. Moreover, the booth is not provided with an enhanced or even continuous separation from the gymnasium.

As a result, the as constructed sound and light booth does not qualify for the exemption under Sentence 3.3.1.13.(2) and must therefore meet the requirements of Sentence (1) and Section 3.4.

The as built pull down ladder and access hatch, however, do not conform to this Section. At dispute therefore, is whether the booth, as constructed, provides any compensating measures to achieve sufficiency of compliance with Article 3.4.1.1. and Sentence 3.3.1.13.(1).

4. **Provisions of the Ontario Building Code**

Article 3.4.1.1. - Scope

(1) Exit facilities complying with this Section shall be provided from every floor area which is intended for occupancy.

Article 3.3.1.13. - Ramps and Stairways

(1) Except as permitted by Sentence (2), Article 3.3.4.7., ans Subsection 3.3.2., ramps and stairways shall conform to the dimensional, guard and handrail requirements in Section 3.4. for exit ramps and stairways.

(2) Ramps and stairways that do not conform to the requirements of Sentence (1) are permitted to serve service rooms and service spaces and in industrial occupancies, provided the ramps and stairways are intended only for occasional use for service equipment and machinery.

Article 1.1.3.2. - Definition of Service Room

Service room means a room provided in a building to contain equipment associated with building services. (See Appendix A.)

5. **Applicant's Position**

The Applicant acknowledged at the outset that the pull down ladder and access hatch does not conform to the exit requirements of Section 3.4. He also recognized that the sound and lighting booth does not fit the definition of a service room in the Code. He explained that the situation regarding the ladder and the access hatch came as result of the building official's advice at the plan review stage that the booth was a service room. Nevertheless, he argued that the booth does provides sufficiency of compliance with Article 3.4.1.1. and Sentence 3.3.1.13.(1) and that it should not be considered as a hazardous space. He offered several reasons.

Prior to making any sufficiency of compliance arguments however, the Applicant offered a possible Code interpretation of the situation. He stated that under the NFPA 101B standard,

"Code for Means of Egress from Buildings and Structures", it was plausible to view the booth as a "lighting and access catwalk". Such catwalks are cited in Exception No. 4 to provision 3-4.1, which deals with the number of means of egress from balconies, mezzanines, stories, etc. Specifically, Exception No. 4 states that a second means of egress is not required from a lighting catwalk and that ladders are permitted as a means of escape.

In terms of compensating measures to achieve sufficiency of compliance, the Applicant indicated that the booth will only be used for two or three times a year when the school's drama department stages a theatrical performance. For the rest of the year the booth will not be in use and will not be accessible. In fact, he argued that there are two levels of security ensuring that the booth remains inaccessible except under supervision of a phys. ed. teacher. The first is that the hatch in the ceiling of the phys. ed. office is locked and remains so unless the booth is being used under appropriate supervision. Second, the phys. ed. office is locked at all times when not occupied by a phys. ed teacher. Access to the booth therefore is strictly controlled and monitored, he argued.

The Applicant also argued that the booth itself should be considered a safe space. It is sprinklered and will be tested to ensure audibility of the fire alarm. (If found lacking, an audible device will be installed in the booth, he noted.) The controls for the sound and lighting will utilize electronic and/or solid state controls. There will be no movie projection equipment or spot lights located in the booth. As well, he indicated that there are openable windows between the booth and the gymnasium. The Applicant also added that a door equipped with free egress hardware is also provided from the booth onto the roof of the building. The door will be monitored by the school's security system and will always be unlocked from inside and locked from outside.

The Applicant offered that specific procedures would be added to the fire safety plan to address access and use of booth. He also stated that he would be willing to add emergency lighting to the booth and the phys. ed. office below to ensure sufficient lighting for safe emergency evacuation.

If the use of the booth was prevented, this would force the school to rent temporary scaffolding and platforms, which would require access by ladders, and would not provide the control and safety offered by the existing, permanent booth. The Applicant argued that this would create a more dangerous situation than anything posed by the access ladder.

The installation of an access and egress stair is not possible due to space limitations, the Applicant noted. Moreover, constructing an exterior stair to access the booth is not feasible

because of security concerns. As a result, short of building the future second floor, the Applicant argued that the pull down ladder and lockable hatch are the best possible solutions given the situation.

6. **Respondent's Position**

The Respondent submitted that because the main function of the booth is to operate sound and lighting for theatrical performances in the gymnasium, it does not conform to the definition of a mechanical or service room as found in the OBC. Besides, the use of the equipment within the room will be by students and not service personnel, she added. As a result, the booth cannot be exempted from the requirements of Section 3.4 as permitted in Sentence 3.3.1.13.(2), and must therefore comply with the exit requirements of Section 3.4. She noted that the as constructed ladder and lockable hatch do not meet these requirements.

The Respondent explained that, in their view, the dispute originated because the construction drawings did not label the rooms and indicate their use. Instead, the rooms were numbered and the numbers were listed in a schedule to the drawings.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the second storey sound and lighting booth as constructed, with a pull down ladder and a lockable access hatch, does not provide sufficiency of compliance with Article 3.4.1.1. and Sentence 3.3.1.13.(1) of the Ontario Building Code at South Lincoln High School, 260 Canborough Road, Smithville, Ontario.

8. **Reasons**

1) The sound control room does not fall within the description of a service room.
2) Adequate compensating measures to achieve sufficiency of compliance were not demonstrated.

Dated at **Toronto** this **4th** day in the month of **November** in the year **1999** for application number **1999-66**.

RULING

1. **The Applicant**

   Mr. Andrew Howcroft, Director of Vocation Services, Welland District Association for Community Living, Welland, Ontario has applied for a building permit under the *Building Code Act, 1992*, to install a stair lift into an existing public stair path at the Seaway Mall, 800 Niagara Street, Welland, Ontario.

2. **Description of Construction**

   The Applicant proposes to install a chair lift on the main exit stairs to serve a non-profit agency that provides support and services to adults with a developmental disability known as the Welland District Association for Community Living (WDACL). The WDACL offers a vocational services employment program called "Community Options", which is located in a mezzanine suite in the Seaway Mall. Currently program staff have been meeting clients with limited mobility on the ground floor of the mall, however, this arrangement offers no privacy and does not afford access to the computer link up with the Human Resources Canada Office in the Community Options' office.

   The building is described as two storeys in building height, 54,554 m^2 in building area and is of noncombustible construction. The mall contains some Group A, Division 2 (assembly), Group D (office) business occupancies, but is mostly comprised of Group E (retail) mercantile occupancies. The building is equipped with a sprinkler system, fire alarm system and a standpipe and hose system.

The construction in dispute involves the placement of the proposed stair lift in the principal exit stair serving the subject mezzanine. Currently, the mezzanine, which consists of nine suites (connected by a public corridor), approximately 1,115 m^2, has an occupant load of 83, and is provided with three exit stairs. Only two of these are considered public stairs, since one stair is located entirely within a suite. Of the two public stairs, the proposed stair lift is to be located in the larger, open stairs that front directly onto the public corridor. The Community Options suite is located immediately adjacent to the subject exit stairs.

The Applicant proposes to fix the stair lift measuring 1,220 mm when in operation, into the 1,675 mm width of the existing stair. When not in operation, the stair lift would only reduce the exit stairs minimally because the single steel rail it runs on is set off to one side and the chair platform folds up when not in use. However, while the lift is in operation, it would reduce the stair width to 456 mm.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the stair lift, with a width of 1,220 mm when in operation, proposed to be located in an existing 1,675 mm wide exit stair provides sufficiency of compliance with Sentence 3.4.3.5.(1) and Clause 3.4.3.1.(2)(b) of the Ontario Building Code.

The former provision stipulates that except under certain circumstances (which are not applicable in this instance) no fixture is permitted to reduce the width of an exit. This requirement applies to all fixtures, etc. regardless of whether they are in operation or not.

The latter Clause is the relevant provision in this case that determines the required exit width. It mandates that the subject exit shall have a width of not less than 900 mm for stairs and ramps. If the occupant load of the mezzanine area was higher and if the stair configuration was different, then Article 3.4.3.4. would be applicable. And if Article 3.4.3.4. applied then the required stair width would probably be wider than the minimum of 900 mm. In this instance, however, Article 3.4.3.4. is not relevant.

4. **Provisions of the Ontario Building Code**

Sentence 3.4.3.5.(1) - Exit Width Reduction

(1) Except as permitted by Sentences (2) to (4) , no fixture, turnstile or construction shall project into or be fixed within the required width of an exit.

Clause 3.4.3.1.(2)(b) - Exit Width

(2) The required width of an exit shall not be less than;
(b) 900 mm (2ft 11 in) for stairs and ramps that serve not more than 3 storeys above grade or not more than one storey below grade.

5. **Applicant's Position**

The Applicant submitted that the installation of the stair lift will not reduce the performance level of the existing exit stairs or block the path of travel in an emergency situation. He noted that as part of the lift installation it would be equipped with a device that would connect it to the mall's fire alarm system. This would offer several safety advantages, he argued. First, in an emergency when the fire alarm had been triggered, the lift would automatically shut down (unless in operation) thereby remaining in its folded-up position at the bottom of the stair. Secondly, if in operation and the fire alarm actuated, then the lift would immediately head in the direction of egress, in this case downwards, to the ground floor and fold up. As well, the lift is also equipped with a release mechanism that if for some reason the lift had malfunctioned during an emergency it could be folded up and locked in position at any point in the stair.

The Applicant also argued that even if the lift was in operation when the fire alarm triggered it would not cause delays. As he noted, the maximum time for the lift to travel from the mezzanine to ground floor is approximately 70 seconds. He asserted that if an emergency were to occur with the lift in operation it would be unlikely that the lift would be at the very top of the stair. As a result, he thought that a median time of 35 seconds for descent of the lift was appropriate. Therefore, using 35 seconds as the operative figure, he argued that most of the occupants on the mezzanine level would not have reached the stair yet, or if in the stair, would not be as far down as the lift.

For these reasons, the Applicant concluded by stating that the stair lift, would not reduce the performance level of the main exit stairs and thereby cause a hazardous exiting situation.

Lastly, the Applicant appealed to the Commission to consider how useful the lift would be to the disabled clients of the Community Options program.

6. **Respondent's Position**

The Respondent submitted that although the lift would make the mezzanine barrier-free accessible, it would create a hazardous situation by narrowing the main exit stair. In particular, he noted that the proposal violated Sentence 3.4.3.5.(1) and Clause 3.4.3.1.(2)(b) by installing a fixture that reduced the required exit width. This, he claimed, would reduce the performance level of the building.

The Respondent also expressed concern about the existing mezzanine, which he claimed does not conform to Code. He noted that if it were constructed new it would need to contain a vertical fire separation between the mall and the corridor and a public corridor leading to two enclosed exit stairs. As it stands now, the existing mezzanine is not well served by exits. He indicated that the other public exit stair is difficult to locate, confusing to navigate, and is not equipped with handrails. He feared that the proposed stair lift would further worsen the situation.

In summation, the Respondent noted that the stair lift did not conform to the relevant provisions of the Ontario Building Code and as a result he indicated that he felt he did not have the authority to accept the proposal.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the stair lift with a width of 1,220 mm when in operation proposed to be located in an existing stair 1,675 mm wide does not provide sufficiency of compliance with Sentence 3.4.3.5.(1) and Clause 3.4.3.1.(2)(b) of the Ontario Building Code.

8. **Reasons**

(i) Adequate measures to achieve sufficiency of compliance were not provided.

RULING

1. **The Applicant**

   Mr. Ian Campbell, Executive Vice-President, Lee Valley Tools Ltd., Ottawa, Ontario has received a building permit under the *Building Code Act, 1992* to construct an addition to a warehouse at Lee Valley Tools Ltd., 1090 Morrison Drive, Ottawa, Ontario.

2. **Description of Construction**

   The Applicant is currently constructing a two storey (with mezzanine and an underground parking garage) addition to an existing Group F, Division 3 - (warehouse) low hazard industrial occupancy (plus a small office) that is used to store gardening tools and supplies. The building is described as being three storeys in building height, constructed of noncombustible construction and equipped with a sprinkler system and a fire alarm system. The extension to the building will be a Group F, Division 3 occupancy on the ground floor and a Group D (office) business use on the second floor. It has a building area of 1,719.3 m^2, and together with the existing building at 3,479.5 m^2, the completed structure will have a building area of 5,198.9 m^2.

The construction in dispute involves the level of structural fire protection to which the building is currently being constructed. At present, the Applicant is constructing the wall and floor assemblies of the addition with a 45 minute fire-resistance rating in accordance with Article 3.2.2.77. of the OBC. This classification, however, places a maximum building area of 4,800 m^2 on the structure if it is sprinklered and considered three storeys in building height. At a total building area of 5,198.9 m^2, the Applicant's building exceeds the permitted area for a three storey building under Article 3.2.2.77. by 398.9 m^2. Considering the projected size of the building when completed, the structural fire protection requirements of Article 3.2.2.75. may be more applicable. This provision allows a three storey sprinklered building to have a total building area of 14,400 m^2, but the building must be of noncombustible construction only and have floor and wall assemblies with a fire-resistance rating of 1 hour.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the proposed addition, currently being constructed with fire separations having a 45 minute fire-resistance rating and that will result in a completed structure with a total building area of 5,198.9 m^2, provides sufficiency of compliance with Article 3.2.2.75. of the Ontario Building Code. This provision sets out the structural fire protection requirements for certain Group F, Division 3 buildings, including three storey sprinklered structures with a maximum building area of 14,400 m^2. Among the fundamental construction standards indicated, are requirements that the building must be of noncombustible construction and that the floor and wall assemblies must have a fire-resistance rating of 1 hour. The Applicant's building, however, has been constructed according to Article 3.2.2.77. which, in comparison to Article 3.2.2.75., allows relaxations on whether combustible material is used in construction and permits the fire-resistance rating to be 45 minutes.

While the Applicant's building is of noncombustible construction, the level of fire-resistance rating is only 45 minutes, however. In order to qualify for the construction requirements found in Article 3.2.2.77., the building must be limited to a building area of 4,800 m^2. The Applicant's building exceeds this maximum by 8.3 percent.

4. **Provisions of the Ontario Building Code**

Article 3.2.2.75 - Group F, Division 3, up to 6 Storeys, Sprinklered

(1) A building classified as Group F, Division 3 is permitted to conform to Sentence (2) provided:

a. except as permitted by Sentence 3.2.2.7.(1), the building is sprinklered;
b. it is not more than 6 storeys in building height, and;
c. it has a building area **that**:
    i. is not limited if the building is more than 1 storey in building height;
    ii. is not more than 21,600 m^2 (233,000 ft^2) if 2 storeys in building height;
    iii. is not more than 14,400 m^2 (155,000 ft^2) if 3 storeys in building height;
    iv. is not more than 10,800 m^2 (116,000 ft^2) if 4 storeys in building height;
    v. is not more than 8,640 m^2 (93,000 ft^2) if 5 storeys in building height, or;
    vi. is not more than 7,200 m^2 (77,500 ft^2) if 6 storeys in building height.

(2) Except as permitted by Article 3.2.2.16., the building referred to in Sentence (1) shall be of noncombustible construction, and;

d. floor assemblies shall be fire separations with a fire-resistance rating not less than 1 h;
e. mezzanines shall have a fire-resistance rating not less than 1 h, and;
f. loadbearing walls, columns and aches shall have a fire-resistance rating not less than that required for the supported assembly.

Article 3.2.2.77. - Group F, Division 3, up to 4 Storeys, Sprinklered

(1) A building classified as Group F, Division 3 is permitted to conform to Sentence (2) provided;

g. except as permitted by Sentence 3.2.2.7.(1), the building is sprinklered;
h. it is not more than 4 storeys in building height, and;
i. it has a building are not more than:
    i. 14,400 m^2 (155,000 ft^2) if 1 storey in building height;
    ii. 7,200 m^2 (77,500 ft^2) if 2 storeys in building height;
    iii. 4,800 m^2 (51,700 ft^2) if 3 storeys in building height, or;
    iv. 3,600 m^2 (38,800 ft^2) if 4 storeys in building height.

(2) The building referred to in Sentence (1) is permitted to be of combustible construction or noncombustible construction used singly or in combination, and;

j. floor assemblies shall be fire separations and, if of combustible construction, shall have a fire-resistance rating not less than 45 min;
k. mezzanines shall have, if of combustible construction, a fire-resistance rating not less than 45 min, and;
l. loadbearing walls, columns and arches supporting an assembly required to have a fire-resistance rating shall:
    i. have a fire-resistance rating not less than 45 min, or;
    ii. be of non-combustible construction.

5. **Applicant's Position**

The Applicant acknowledged at the outset that size of the currently constructed building addition exceeds the maximum permitted in Article 3.2.2.77. As a result, the structural fire protection standards of 45 minutes also found in that provision may not be applicable to their building under a literal reading of the OBC. Nevertheless, in his view, the finished building will meet the same level of life safety intended in the Building Code. He indicated that he would present arguments to demonstrate sufficiency of compliance with Article 3.2.2.75.

The Applicant argued that the intent of Subsection 3.2.2. of the OBC is to ensure adequate fire protection and safety for the building occupants. He stated that the subject building provides a sufficient level of safety for the occupants. To demonstrate this, he argued that it is sensible to consider, especially when dealing with occupants and specifically issues of occupant load, the overall floor area of the building as an important factor. He offered two discussions regarding the size of the building in terms of floor area and its level of structural fire protection.

The first discussion was based on an extrapolation of the maximum building area allowed for a 3 storey building under Article 3.2.2.77. The Applicant argued that if the 4,800 m^2 maximum footprint were multiplied by the number of permitted storeys for that area, the total floor area allowed in a building under the more relaxed standards found in Article 3.2.2.77. would be 14,400 m^2. In comparison, the total floor area of his building when the addition is completed, at 9,648.7 m^2, he noted will be far less. In other words, he felt that the design of his building, with the significantly smaller upper floors and the inherent increase of safety that this creates is not recognized by the OBC.

The Applicant also argued that the provision which directly applies to the construction of his building, Article 3.2.2.75., was onerous and is meant for considerably larger structures. At 14,400 m^2 of building area for a 3 storey building, this Article determines the construction

standards for buildings that have considerably more floor area per floor than he has in his entire building.

The second discussion offered by the Applicant was that if the areas of the existing building and new addition that currently meet the fire-resistance rating requirements of OBC 3.2.2.75., such as the small office space, the fire-rated stair enclosures and vehicle ramp, and the lobby were subtracted from the total building area, the net building area remaining is only 4,632 m^2. Well within the maximum building area imposed by Article 3.2.2.77., the Applicant indicated.

Lastly, the Applicant stated that at roughly eight percent over the allowable limit, the building is only marginally over the maximum. Moreover, the structure will have a low occupant load and it has exceptional fire fighting access since it faces three streets and is surrounded by large windows.

In conclusion, the Applicant indicated that in order to achieve sufficiency of compliance they would be willing to restrict the total gross floor area of the building to under 5,200 m^2.

6. **Respondent's Position**

The Respondent submitted that the building's area is too large to be considered under Article 3.2.2.77. As a result, he argued that Article 3.2.2.75. is the applicable construction criteria, and therefore the appropriate fire-resistance rating for the wall and floor assemblies of the subject building is one hour.

The Respondent did indicated that he was sympathetic to the arguments present by the Applicant, nevertheless he felt that the municipality did not have the authority to accept neither the eight percent additional building area nor the arguments based on floor area or subtracting the one hour rated areas from the rest of the ground floor as an equivalent to Article 3.2.2.75.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the addition, currently being built with fire separations having a 45 minutes fire-resistance rating and that will result in a completed structure with a total building area of 5,198.9 m^2, does not provide sufficiency of compliance with Article 3.2.2.75. of the Ontario Building Code at Lee Valley Tools Inc., 1090 Morrison Drive, Ottawa, Ontario.

8. **Reasons**

i. A building constructed to the requirements of Article 3.2.2.77. is limited to a building area of 4,800 m^2. The Applicant's proposed building will have a building area of 5,198.9 m^2.

Dated at **Toronto** this **21st** day in the month of **October** in the year **1999** for application number **1999-73**.

RULING

1. **The Applicant**

   Mr. Eli Swirsky, Brant Plains Holdings Inc., Toronto, Ontario has received an order to comply under the *Building Code Act, 1992,* to remedy certain deficiencies at the Brant Plains Plaza, 1053 Brant Street, Burlington, Ontario.

2. **Description of Construction**

   The Applicant has recently constructed an addition to a Group E - (retail plaza) mercantile occupancy. The completed building is described as an L-shaped structure one storey in building height, having a building area of 2,445.17 m^2 and facing two streets for fire fighting access. The building is constructed of noncombustible construction and is equipped with a sprinkler system and a standpipe and hose system.

   The construction in dispute involves the 1.4 m canopy projecting from the exterior wall. Specifically at issue is the absence of sprinkler protection from the underside of the canopy

covering the area below. The canopy is constructed of metal framing members enclosed with sheathing consisting of exterior grade plywood which has been treated with a fire-retardant coating to provide a flame spread rating of 25 or less. The wall separating the canopy from the from the interior of the building provides a one hour fire separation, but from the interior only.

The building's sprinkler system was also not extended to the space within the canopy itself. This issue was resolved to the satisfaction of the municipality, however, through the application of the fire-retardant material. In their view, since this brought the flame spread rating to 25 or less, NFPA 13, in particular Clause 4-4.1.7.1., has been met. (This provision requires that all concealed spaces enclosed with any combustible construction must be sprinklered. Exceptions are provided to Clause 4-4.1.7.1. Of these, Exception No. 8 states that "when the exposed surfaces have a flame spread rating of 25 or less and the materials have been demonstrated not to propagate fire in the form in which they are installed in the space.")

The addition, including the canopy, was constructed under OBC Article 3.2.2.44., which permitted the structure to be of combustible construction if sprinklered.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is to determine whether the 1.4 m exterior canopy, which has not been provided with sprinkler protection in the area beneath the canopy, provides sufficiency of compliance with Sentence 3.2.5.13.(1) of the 1990 Ontario Building Code. This provision stipulated that a sprinkler system must meet the requirements of NFPA 13-91, "Installations of Sprinkler Systems". In turn NFPA 13, in particular Clause 4-4.1.7.6., specifically 4-4.1.7.6.1. and 4-4.1.7.6.2. respectively, require that sprinklers must be installed in canopies over areas where combustibles are stored and handled and that they must be installed in canopies that extend more than 1.2 m in width. The control over what is placed under a canopy is difficult. As well, the width of the Applicant's as constructed canopy is 1.4 m.

At issue therefore is whether limiting the storage and handling of combustible materials under the canopy is sufficient to compensate for the omission of sprinkler protection below the canopy.

4. **Provisions of the Ontario Building Code**

Sentence 3.2.5.13.(1) - Automatic Sprinkler Systems

(1) Except as provided in Sentences (2) and (3), where a sprinkler system is required, it shall be

designed, constructed, installed and tested in conformance with NFPA 13, "Installation of Sprinkler Systems". (See Appendix A.)

5. **Applicant's Position**

The Applicant acknowledged at the outset that a literal reading of the various applicable Clauses in NFPA 13, as referenced by OBC Sentence 3.2.5.13.(1), for a canopy over 1.2 m in width would require sprinklers to be installed. He indicated, however, that the owners and tenants of the plaza have provided letters stating that they would restrict the storage, handling and vending of combustible material under the canopy and that these have been submitted to the municipality.

By way of compensating measures to achieve sufficiency of compliance, the Applicant argued that there would be no combustible materials under the canopy to contribute to the fuel load. He argued that the letters already provided would bind the owners from doing this. He also offered to post a sign under the canopy to remind tenants, owners and patrons of the plaza regarding the prohibition of combustible materials. Lastly, the Applicant indicated that he was willing to fire stop the canopy between the individual tenancies.

The Applicant concluded by stating that, in his opinion, the above measures would adequately compensate for the lack of sprinkler protection below the disputed canopy.

6. **Respondent's Position**

The Respondent submitted that as per OBC Sentence 3.2.5.13.(1) sprinkler systems must be installed in accordance with and NFPA 13, in particular Clauses 4-4.1.7.6.1. and 4-4.1.7.6.2. These provisions, he argued, both require that sprinkler protection be provided below the as built 1.4 m wide combustible canopy.

The Respondent argued that sprinklering was required below the canopy for two reasons. The first is that although the Applicant has submitted letters agreeing not to display, store or sell combustible material under the canopy, experience has shown that such letters have proved ineffective in preventing such an occurrence. To support this argument, some enforcement files of the Fire Department were presented. He indicated that owners sometimes forget that they have agreed to such a limitation concerning the space underneath the canopy, whereas at other times accidental situations occur, such as a shipment or delivery which gets left under the canopy. Moreover, constant enforcement of the situation by the Fire Department is neither practical nor

possible. The situation is even harder to control in multi-tenant facilities where the turnover of tenants is much higher.

The Respondent also argued that if sprinklers are installed to protect the area under the canopy both parties benefit because owners and tenants are free to use that space as they want and the municipality does not have to waste precious enforcement time fighting a losing battle. For these reasons, his position was that to achieve conformance with NFPA 13 Clause 4-4.1.7.6.1., sprinklers are necessary, but they are also practical.

The second reason is that NFPA 13, Clause 4-4.1.7.6.2., requires sprinklering under combustible canopies wider than 1.2 m. As the Respondent noted, the disputed canopy is 1.4 m in width.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the 1.4 m exterior canopy, which has not been provided with sprinkler protection in the area below the canopy, does not provides sufficiency of compliance with Sentence 3.2.5.13.(1) of the 1990 Ontario Building Code at the Brant Plains Plaza, 1053 Brant Street, Burlington, Ontario.

8. **Reasons**

(1) Sufficiency of compliance was not provided and the canopy does not meet the Ontario Building Code.

Dated at **Toronto** this **21st** day in the month of **October** in the year **1999** for application number **1999-63**.

The Respondent

RULING

1. **The Applicant**

   Mr. Bruce Stanton, Director, Resort Services, Bayview-Wildwood Resort Ltd., Severn Bridge, Ontario has received a building permit under the Building Code Act, 1992 and is currently rebuilding a hotel structure, known as Lakeshore House, at the Bayview-Wildwood Resort Ltd., 1500 Port Stanton Parkway, R. R. 1, Severn Bridge, Ontario.

2. **Description of Constrution**

   The Applicant is currently reconstructing and renovating a hotel building located on a year-round resort property. The subject building, as the second largest on the site, is one of the principal buildings on the resort. The structure was gutted by fire in April of 1999. The reconstruction portion of the project will essentially create an upgraded version of the earlier structure that will include two floors of hotel suites (6 suites per floor) and a pool in the basement. The major

renovation work involved is the construction of an addition to the west of the existing building that will include a squash court, a conference area and a viewing mezzanine. (This portion of the project is not in dispute.) The complete building is therefore classified as having three major occupancies; Group A - Division 2 (conference area, etc.), Group A - Division 3 (swimming pool) and Group C (hotel).

The structure is described as facing one street, of combustible construction, two storeys in building height (plus basement) and 472.8 m^2 in building area. This includes the 269 m^2 of building area of the existing hotel occupancy and the 203.8 m^2 of building area to be added with the construction of the squash court and conference area. All three occupancies in the building will provide, as required, separations with a fire-resistance rating of 45 minutes and a one hour separation between occupancies. The building will also be equipped with a fire alarm system.

The construction in dispute involves the two exit stairs located at either end of the exterior corridors the serve the ground and second floor residential suites. Both exit stairs are covered with roofs and partial walls enclosing the ends and sides of the landing areas. The sides of the stairs themselves, however, are open. In particular, there are also no walls separating the stairs at their access point from the corridors.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the definition of "Exit" as set out in Article 1.1.3.2. and Sentence 3.4.4.1.(1) of the Ontario Building Code require that the proposed exterior stairway serving a second storey exterior walkway be enclosed with a fire separation with an appropriate fire-resistance rating. The definition of exit includes the words "protected from fire exposure from the building". The Respondent is reading this to mean that the exit, in particular the exit stairs, must by definition be protected. The Applicant disagrees with this view.

The second provision, Sentence 3.4.4.1.(1), stipulates, except under certain conditions, that an exit be fire separated to a certain level of fire-resistance rating from the remainder of the building. While the other exceptions listed in this Sentence are not relevant to the dispute at hand, Sentence 3.4.4.3.(1) is germane. This Sentence states that the fire separation requirements for exits found in Sentence 3.4.4.1.(1) and in Sentences (1) and (3) of Article 3.2.3.12., "Protection of Exit Facilities", are not applicable to an exterior exit passageway if at least fifty percent of the exterior side is open and an exit stair is located at either end of the passageway. The subject building meets both of these criteria.

Sentence (2) of Article 3.2.3.13., however, is relevant. This provision requires that if an unenclosed stair may be exposed to fire from openings in the exterior wall of the building it serves, the relevant openings, as measured within certain distances horizontally, above or below, shall be protected in accordance with Sentence (4) of that Article. The proximate openings in the structure at hand have all been protected. Significantly, whereas Sentence 3.2.3.13.(2) determines when (and in Sentence (4) how) to protect unenclosed exit stairs from openings in the building, it does not stipulate that the exit be enclosed.

At issue therefore, is whether the Building Code requires the subject building to provide a fire separation with adequate fire-resistance rating between the remainder of the building and the unenclosed exterior stairs.

4. **Provision of the Building Code**

Article 1.1.3.2. Defined Terms

Exit means that part of a means of egress, including doorways, that leads from the floor area it serves, to a separate building, an open public thoroughfare, or an exterior open space protected from fire exposure from the building and having access to an open public thoroughfare. (See Appendix A.)

Article 3.2.3.12. Protection of Exit Facilities

1. Except as required by Sentence (3) and as permitted by Sentence 3.4.4.3.(1), if the plane of an exterior wall of an exit enclosure forms an angle less than 135^0 with the plane of an exterior wall of the building it serves, and an opening in the exterior wall of the exit enclosure could be exposed to fire from an opening in the exterior wall of the building, the opening in either the exterior wall of the exit or the exterior wall of the building shall be protected in conformance with the requirements of Sentence (4) where the opening in the exterior wall of the building is within 3 m (9 ft 10 in) horizontally and;
    a. less than 10 m (32 ft 10 in) below an opening in the exterior wall of the exit; or
    b. less than 2 m (6 ft 7 in) above an opening in the exterior wall of the exit.

    > (See A-3.2.3.13.(1) in Appendix A.)

2. If an unenclosed exterior exit stair or ramp could be exposed to fire from an opening in the exterior wall of the building it serves, the opening in the exterior wall of the building

shall be protected in conformance with the requirements of Sentence (4) where the opening in the exterior wall of the building is within 3 m (9 ft 10 in) horizontally and;

a. less than 10 m (32 ft 10 in) below the exit stair or ramp; or
b. less than 5 m (16 ft 5 in) above the exit stair or ramp.

3. Except as permitted by Sentence 3.4.4.3.(1), if an exterior exit door in one fire compartment is within 3 m (9 ft 10 in) horizontally of an opening in another fire compartment and the exterior walls of these fire compartments intersect at an exterior angle of less than 135^0, the opening shall be protected in conformance with therequirements of Sentence (4).

Article 3.4.4.1. Fire-Resistance Rating of Exit Separations

4. Except as permitted by Sentences (2), (4), 3.3.5.4.(3), 3.4.4.2.(2) and 3.4.4.3.(1), every exit shall be separated from the remainder of the building by a fire separation having a fire-resistance rating not less than that required by Subsection 3.2.2., but not less than 45 min, for:

a. the floor assembly above the storey; or
b. the floor assembly below the storey, if there is no floor assembly above.

Article 3.4.4.3. Exterior Passageway Exceptions

5. The requirements of Sentences 3.4.4.1.(1) and 3.2.3.12.(1) and (3) do not apply to an exterior exit passageway provided:

a. not less than 50% of the exterior side is open to the outdoors; and
b. an exit stair is provided at each end of the passageway.

5. **Applicant's Position**

The Agent for the Applicant submitted that the OBC does not require that the exterior stairs be enclosed. He pointed out that if the conditions of Sentence 3.4.4.3.(1) are met, then the fire separation requirements of Sentences 3.2.3.12.(1) and (3) and 3.4.4.1.(1) can be waived. He noted that both of the conditions - having fifty percent of the exterior side open to the outside and having exit stairs at each end of the passageway - have clearly been met in the design of the subject building.

The Agent also rejected the Respondent's argument that exits by definition must be fire separated from the rest of the building. In his interpretation, the definition of exit in Article 1.1.3.2. indicates that where it says "protected from fire exposure from the building" actually relates only

to the words "an exterior open space" immediately proceeding those and is not a condition that pertains to exits in general as they are defined. To support this assertion he pointed out that Clause (1)(d) of Article 3.4.1.4. specifically lists "an exterior stairway" as a type of exit. He argued that it would inconsistent if the Building Code required separation and enclosure of exits (including stairs) in Article 1.1.3.2. and then permitted exterior stairs to be considered as an exit. As a result, he stated that Code does require a fire separation in this situation.

The Agent also argued that the building provided a high level of safety without the disputed separation. He noted that the building meets Sentence 3.2.3.13.(2) which requires that openings in the building face in the proximity of the exit stairs be protected. There are no windows in the exposing building face, which will have a 45 minute rating , and the doors will provide the required 20 minute rating, he added. Another factor making the building safe, the Agent indicated, is that each suite is provided with its own balcony on the side of the hotel opposite to the exterior corridors. As well, the new fire alarm system goes beyond minimum Code requirements and will be an improvement on the previous one.

For the above reasons, the Agent concluded that the exterior unenclosed exit stairs are not required to be fire separated from the remainder of the building and the stairs - as designed - will provide the level of safety intended in the OBC.

6. **Respondent's Position**

The Respondent submitted that the exposed exterior wooden stairs must be compartmentalized in order to conform to the requirements of the OBC. He argued that according to its definition in Article 1.1.3.2 exits are required to "protected from fire exposure from the building" they serve. This level of safety was warranted, he noted, because exits are a fundamental life safety feature of any building. However, in the subject structure the disputed fire separation is especially important as the building is constructed of combustible materials, the volunteer fire department cannot respond as quickly as in urban areas and the hotel has recently experienced a catastrophic fire.

The Respondent also expressed concern about various other aspects of the facility's safety. For example, he noted that there is a CN rail line that, if occupied by a train during an emergency, could potentially cut off access to the resort. In addition, being a remote site the water supply for fire fighting purposes is limited. Because of this, the Respondent indicated that he would prefer to see a dry pump system installed that could draw water from the lake.

While the Respondent acknowledged that his interpretation of this issue differed from that of the Applicant and the Technical Background Information memo written for this hearing by the Ministry's Housing Development and Buildings Branch, he asserted that the training he has received throughout his career taught him that all exit stairs, even those serving exterior corridors, had to be fire separated from rest of the building. He indicated that the present hearing afforded him the opportunity to seek clarification on this matter.

7. **Commission Ruling:**

   It is the decision of the Building Code Commission that neither the definition of "Exit" as set out in Article 1.1.3.2. nor Sentence 3.4.4.1.(1) require that the proposed exterior stairway serving ground and second floor exterior walkways be enclosed with a fire separation at the Bayview-Wildwood Resort, Severn Bridge, Ontario.

8. **Reasons:**
   a. With compliance with all applicable other Code requirements in Sections 3.3 and 3.4, the as-constructed unenclosed stairs will provide adequate exiting for the subject building.

Dated at Toronto, this 21st day, in the month of October, in the year 1999, for application number 1999-61.

RULING

1. The Applicant

Ms. Susan Croswell, Associate, Griffiths Rankin Cook Architect, Ottawa, Ontario, has received a building permit under *the Building Code Act, 1992* to construct an addition onto the John McCrae Secondary School, Walter Baker Centre, Nepean, Ontario.

2. Description of Construction

The Applicant proposes to construct a new wing to the south of an existing Group A, Division 2 (secondary school and sports facility) occupancy. The completed building will be three storeys in building height, 4,675 m^2 (in building area) and will be of noncombustible construction. The structure will be equipped with a sprinkler system, a standpipe and hose system and a fire alarm system. The three storey addition is to be provided with 3 exit stairs.

The construction in dispute involves the amount of glazed area in the interior enclosure wall assemblies that separate exit stairs number two and three from the corridors they serve. Specifically, the stair enclosures in dispute are located at the ground, second and third floors for exit stair number two and at

the second and third floors for exit stair number three. All of the proposed stair enclosures are to be constructed of wired glass supported by a hollow metal frame providing a 3/4 hour fire-resistance rating.

In terms of their design, the exit enclosures on the ground and second floor of stair number two and on the second floor for stair number three have four fixed windows of differing sizes (the largest of which measures 600 mm by 800 mm for an area of 0.72 m^2) , for a total aggregate glazed area of approximately 1.9 m^2 . For the wider third floor enclosures at stairs number two and three, the window pattern at the other locations is repeated separated by a 600 mm drywall partition. All stair enclosures are provided with two access to exit doors each.

A temporary solution of 18 mm thick drywall has been installed over the glazed area in excess of 0.8 m^2 .

The amount of glazed area in the access to exit doors serving the subject exit stairs is not in dispute.

3. Dispute

The issue at dispute between the Applicant and Respondent is to determine whether the proposed exit stair enclosures containing a set of four wired glass panels (and in some cases two sets), none of which exceed 0.8 m^2 , but which have an aggregate area of 1.9 m^2 , as part of a wall assembly providing a 3/4 hour fire-resistance rating complies with Article 3.1.8.16. of the 1990 Ontario Building Code. Among other things, this provision sets out in Table 3.1.8.B. the maximum glazing allowed in an area which is not in a door. As indicated in the Table, the maximum aggregate area of wired glass permitted which is not in a door is 0.8 m^2 . The Applicant's stair enclosures exceed this amount by at least 1.1 m^2 .

4. Provisions of the Ontario Building Code

Article 3.1.8.16. Area Limits for Wired Glass or Glass Block

Except as provided by Article 3.1.8.17., the maximum area of wired glass in a door and the maximum area of wired glass panels or glass block not in a door shall conform to Table 3.1.18.B. when used in the locations shown in the Table.

5. Applicant's Position

The Applicant submitted that proposed stair enclosures, as designed, complies with the intent of Article 3.1.8.16. of the OBC. As he argued, the intent of this provision is to minimize radiant heat caused by the ignition of combustible materials located near the enclosure walls t hat may pass through the glass

panels and expose occupants to excessive temperatures during emergency exiting. The glazed area restriction in the Code, he noted, does not apply to the access to exit doors in the subject enclosures because the placement of combustible materials, or any type of materials for that matter, would disrupt the usage of the door.

The same rationale of permitting the waiving of standards for the doors, however, can be applied back to the rest of the enclosure wall assembly, he argued. This is due to the fact that there is no occupancy in the adjacent corridors, and thus no storage will be permitted next to the enclosure walls. Regardless, no materials would be placed there because, as the Applicant stated, the point of the increased glazed area is to enhance natural lighting and security in the stairs.

The Applicant compared the proposed design to other situations envisage in the Building Code. In Article 3.4.4.2., "Exit Through Lobbies", for example, an exit is allowed to lead through a lobby with an unrated separation provided the lobby and adjacent areas are sprinklered. As well, Article 3.2.3.13., "Wall Exposed to Another Wall", waives the requirement for a limiting distance between two unprotected openings in two separate fire compartments if both compartments are sprinklered. In both these examples he argued that the effect of the sprinklers would be to control the fire and would therefore control the fire exposure. In the case in the first example, this control of the fire exposure would specifically allow exiting to occur unimpeded. It is also an example of where an active system - the sprinklers - is allowed to replace a passive system, i.e., a fire separation. Drawing a parallel between those examples and the subject building, the Applicant argued that since this is a fully sprinklered facility, the fire suppression that would be provided would act to minimize radiant heat from a fire thereby allowing safe passage of occupants in the exit stairs.

To support this assertion, the Applicant presented the results of a fire modelling analysis done on this project conducted by a fire safety research scientist. The fire modelling analysis looked at two scenarios, the worst of which placed a fire in a room with an open door directly opposite from the third floor enclosure which has an aggregate glazed area of 3.8 m^2 . The findings of the analysis demonstrated that the sprinkler system would actuate and control the fire before dangerous levels of radiant heat exposure was experienced in the exit stair.

In conclusion, the Applicant stated that the design of the stair enclosure meets the intent of the Code and that no radiant heat problem would occur. As a result of the building being sprinklered no aggregate limit of wired glass should be imposed on the stair enclosures.

6. Respondent's Position

The Respondent submitted that the exit stair enclosures that have 1.9 and 3.8 m^2 of glazed area contravene the prescriptive requirements of Table 3.1.8.B. of the 1990 OBC. A relaxation of the 0.8 m^2 maximum glazed area requirement is only possible by providing enhanced physical separations through the introduction of vestibules or rated corridors, as per Article 3.1.8.17. The Respondent noted, however, that the Applicant has not chosen to exercise this option.

The Respondent rejected the argument that the fact the building is of noncombustible construction and is sprinklered that the proposed glazed area should be permitted. The Code does not allow a trade off between sprinklers and the amount of glazed area allowed, he noted. The exiting of occupants is the highest priority of building fire safety, he argued, and while the noncombustible construction and the sprinkler system assist in maintaining the integrity of the building in a fire, it is only the exit route that provides for a way out in an emergency. The integrity of the exit itself should not be reduced, he stated.

7. Commission Ruling

It is the decision of the Building Code Commission that the requirements of Article 3.1.8.16. of the Ontario Building Code have not been satisfied.

8. Reasons

The Applicant did not submit any compensating measures or alternative proposals to achieve sufficiency of compliance.

Dated at Toronto this 23rd day in the month of September in the year **1999** for application number **1999-54**.

BCC Ruling No. 99-60-716

BUILDING CODE COMMISSION DECISION ON B.C.C. #99-60-716

IN THE MATTER OF Subsection 24 (1) of the *Building Code Act, 1992*.

AND IN THE MATTER OF Article 3.2.9.1. of Regulation 403, as amended by O. Reg. 22/98, 102/98 and 122/98 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. David Malcolm, Purchasing Manager, Taylor Steel Inc., Stoney Creek, Ontario, for the resolution of a dispute with Mr. Henry Dekker, Chief Building Official, City of Stoney Creek, Ontario, to determine whether the proposed expanded steel manufacturing facility with a total building area of 22,135 m^2 (238,267 ft^2), that is not equipped with a standpipe and hose system, provides sufficiency of compliance with Article 3.2.9.1. of the Ontario Building Code at the Taylor Steel plant, 395 Green Road, Stoney Creek, Ontario.

RULING

1. **The Applicant**

   Mr. David Malcolm, Purchasing Manager, received a building permit under the *Building Code Act, 1992*, and is currently constructing an addition onto an existing steel processing plant at the Taylor Steel plant, 395 Green Road, Stoney Creek, Ontario. As well, the Applicant has recently applied for another building permit to construct a further addition to the subject building.

2. **Description of Construction**

   The Applicant is currently constructing phase one of a two stage expansion plan to their existing one storey steel processing plant with a building area of 6,132 m^2. Phase one consists of a one storey, 7,472 m^2 L-shaped addition that will be attached to the south and east portions of the existing building. Phase two, which is presently in plans review, proposes to construct a second one storey, 8,531 m^2 addition that is to run almost the complete length of the southern exposing building face (which is currently being built in phase one).

The total building area when both phase one and two are completed would be 22,135 m^2. The entire building, including the existing, under construction and proposed portions is of noncombustible construction. It is equipped with a fire alarm system and a standpipe and hose system, but the hose system is limited to the original building only. There is no sprinkler system in the building. The structure is classified as a Group F, Division 3 - Low Hazard Industrial occupancy.

The plant is to be used in the processing of cold, rolled steel. It will also be used for the storage of materials produced in the plant and elsewhere.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the proposed expanded steel processing facility, with a total area of 22,135 m^2, of which 16,003 m^2 of building area currently being built and proposed to be built is not to be equipped with a standpipe and hose system, provides sufficiency of compliance with Article 3.2.9.1. of the Ontario Building Code. This provision requires that a building with an F3 occupancy exceeding 3,000 m^2 must be equipped with a standpipe and hose system. The proposed expansions to the steel plant will make the building far larger than the maximum allowed in Article 3.2.9.1. The Applicant has, however, proposed sufficiency of compliance with this OBC provision by offering an enhanced fire alarm system.

4. **Provisions of the Ontario Building Code**

Article 3.2.9.1. - Where Required

(1) Except as provided in Sentences (4) to (7), a standpipe system shall be installed in every building that;

(a) is more than 3 storeys in building height;
(b) is more than 14 m (45 ft 11 in) high measured between grade and the ceiling of the top storey, or;
(c) is not more than 14 m (45 ft 11 in) high measured between grade and the ceiling of the top storey but has a building area exceeding the area shown in Table 3.2.9.1. for the applicable building height if the building is not sprinklered.

(2) A standpipe system shall be installed in every basement of a building that requires a standpipe system above grade.

(3) A standpipe system shall be installed in every basement of a building that regulated by Sentence 3.2.2.15.(2).

(4) A standpipe system is not required to be installed in the lowest storey in a building if this storey is a service room which has an area not more than 50 m^2 (538 ft^2).

(5) A standpipe system is not required to be installed in a roof-top enclosure if this enclosure has an area not more than 50 m^2 (538 ft^2).

(6) A standpipe system is not required to be installed in a storage garage conforming to Article 3.2.2.83 provided the building is not more than 15 m (49 ft 3 in) high.

(7) A standpipe system is not required to be installed in a dwelling unit which;

(a) extends not more than 3 storeys above adjacent ground level;
(b) is completely cut off from the remainder of the building so that there is no access to the remainder of the building, and;
(c) has direct access to its interior by means of an exterior doorway located not more than 1 500 mm (4 ft 11 in) above or below adjacent finished ground level.

5. **Applicant's Position**

The Applicant submitted that a standpipe and hose system, although required, may not be appropriate for the proposed building because it is, and will be, constructed entirely of noncombustible materials. He also indicated that the materials produced and stored in the facility are not combustible. The handling and shearing equipment, which is operated by electric motors and a propane-powered tow motor is combustible but this would only cause a very localized fire. As the Applicant noted, the risk of fire is low.

The Applicant argued, in fact, that the steel products and manufacturing equipment in the plant would be more severely damaged by water used for fire fighting purposes than by the heat created during a small fire. He was also concerned about accidental breakage of water pipes due to pipe rupture, etc. The Applicant stated that any uncontrolled introduction of water into the plant's manufacturing and storage areas would be catastrophic and would render the steel orthless.

In terms of providing sufficiency of compliance for the proposed omission of a standpipe and hose system, the Applicant is proposing three compensating measures. The first measure the Applicant intends to provide is a fire suppression system provided by a series of ABC type portable extinguishers located throughout the plant. The staff at the plant would be trained to check, service and use the fire extinguishers, as well as perform other fire procedures. Also, the plant is operated on a 24 hour basis and the Applicant indicated that they have never had a previous fire.

The second compensating measure that the Applicant is providing an access route around the entire plant for fire fighting purposes. He also noted that there is an adequate water supply to the site since there are three fire hydrants on the property, one located on the Applicant's property and two on the municipal street facing the plant. As well, there is a local fire hall only 5 minutes away.

The third measure proposed by the Applicant is a fire alarm system that includes heat detection devices, bells, pull stations and a system monitoring panel that is interconnected to the security system.

The Applicant asserted that their alternative fire safety measures provide sufficiency of compliance with OBC Article 3.2.9.1. In his view, these three compensating measures, the extinguishers, the fire fighting access routes, and the fire alarm system, compensate for not providing a standpipe and hose system.

6. **Respondent's Position**

The Respondent submitted that as an F3 occupancy with a building area of 22,135 m^2, the proposed structure is required to have a standpipe and hose system in accordance with Article 3.2.9.1. of the OBC. He noted that the two existing hose racks do provide some protection, but their coverage is poor considering the vastly expanded size of the plant. The Respondent indicated that he was concerned about future owners of the building and being able to require a standpipe system at a later date. He stated that registering the building's current use on title would be quite useful. This would allow the municipal building department an opportunity to review the building and assess whether a standpipe and hose system should be required of a potential future owner. Lastly, he noted that other steel plants in the area have sprinklered their entire building.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the expanded steel manufacturing facility with a total area of 22,135 m^2 not equipped with a standpipe and hose system provides sufficiency of compliance with Article 3.2.9.1. of the Ontario Building Code provided:

(i) The use of the building is registered on title to ensure that the current use continues.
(ii) The fire access route is provided on the south face complying with Article 3.2.5.5.
(iii) A hydrant(s) is provided on the south access route in conformance with Article 3.2.5.7.

8. **Reasons**

(i) The primary building use is for storage of cold rolled steel with a low fire load.
(ii) A monitored fire alarm system is provided.
(iii) All construction is non combustible.
(iv) Access and water supply for fire fighting is provided via access routes and additional hydrants.

Dated at Toronto this 22nd day in the month of April in the year 1999 for application number **1999-18**.

RULING

1. **The Applicant**

   Mr. Gary Hauck, Estimating Manager, Ball Construction Inc., Kitchener, Ontario has applied for a building permit under the to renovate an existing retail mall by constructing a new sports arena addition and multi-purpose entertainment facility to become known as the Guelph Sports and Entertainment Centre, Guelph, Ontario.

2. **Description of Construction**

   The Applicant is proposing to construct a new Group A, Division 3 - (5,000 seat sports arena) assembly occupancy to the north of, and adjoining to, an existing Group E - mercantile and Group A, Division 2 - assembly (retail mall) facility that was built in the early 1980s. The combined total of the 6,500 m^2 arena addition and the 8,600 m^2 of the existing mall will create an aggregate building area of approximately15,100 m^2. The completed structure will be constructed

of noncombustible construction and will be equipped with a sprinkler system, a two-stage fire alarm system and a standpipe and hose system.

The existing mall is considered a two storey structure containing retail and fast food outlets. The arena is to have three levels. The lowest level will contain the ice surface and, beneath the stands, dressing and training rooms, offices, and storage and mechanical areas. This level will also have a public corridor containing a sports hall of fame that will wrap around the west end of the arena. The middle level of the stadium will be called the main, or concourse, level. This level is to contain an oval-shaped concourse area around the entire perimeter of the arena from which the majority of the seats are to be accessed. Several concession stands, a bar and washrooms will be located off the concourse area. The third level, described as the VIP balcony, is to contain 31 private boxes. The total occupant load for the arena will be approximately 6,000.

The new arena, to house the Ontario Hockey League's Guelph Storm, is to be built on the site of a recently demolished Eaton's Department Store. Currently, the City of Guelph owns the land upon which the existing mall sits and the proposed stadium is to occupy. It is the City's intention, however, to sever the land into two parcels along a discontinuous plane between the mall and the arena in order to allow for separate ownership of the two facilities. The future owners of the arena and mall structures will lease the land from the City.

The arena is to be constructed as an addition to the existing mall, and not as a separate building. There will be no continuous demising wall built on the property line at the various storeys where the structures join. In fact, in terms of its architecture and operation, the arena and mall are to be as integrated as possible. At the interface between the two structures on the lowest level, where the ground floor of the mall is to intersect with the ice level of the arena, the main corridor of the mall will connect to a curved public corridor used as a sports hall of fame. The curved corridor is to be separated from the remainder of the stadium by a 2 hour fire separation and will be used as a principle means of egress from the north end of the lower mall level.

A food court and kitchen are to be located where the two buildings join at the upper level, i.e., where the second floor of the mall will connect with the concourse level of the arena. The food court is to be accessible to arena patrons during an event and will be available to shoppers in the mall during business hours. At the north side of the food court area, between the food court and the arena, a wall will partially separate these spaces. This wall will be comprised mostly of concrete block with a 2 hour rating, as well as sliding tempered glass panels located directly beside the existing stair at the north side of the mall. The wall will also contain several sets of

doors, including four doors and a solid-panel folding security grill at the east side of the arena and a pair of swing doors and a set of tempered sliding glass panels at the west side. The sliding glass panels, with an approximate area of 8 m^2, are to be manually operated and are to be used as a security barrier to prevent access to the arena when not in use. The panels are to be slid open during an event. Considering the unrated glazed area and the wall penetrations, especially the sliding glass panels, the interface of the structures at this level is not considered as providing a continuous 2 hour rated fire separation.

There is no direct connection between the mall and the VIP balcony found at the 3rd level of the stadium.

The construction in dispute relates to the fact that no firewall is being proposed on the property line that separates the mall and the arena. Further, the Applicant is not intending to construct the arena addition with either a continuous 2 hour vertical fire separation where the mall and the arena intersect including the appropriate closures, nor in accordance with the interconnected floor space requirements as found in Articles 3.2.8.3. to 3.2.8.11. These additional fire safety requirements may be necessary because of the building height of the mall and arena addition, which could be interpreted as being 3 storeys. Such an interpretation is due to the fact that the building, when viewed in section, will have three distinct levels. The VIP balcony at the top level of the arena must be counted as a storey because it exceeds the Building Code's requirements for a balcony. Moreover, part of the area under the seats at the arena's lowest level - usually not considered a storey if incidental to the major occupancy of the building according to Sentence 3.2.1.1.(2) - contains a sports hall of fame, thereby potentially rendering that level as a storey. Thus, if a three storey building, certain additional fire safety measures may be required since the exceptions in terms of providing the interconnected floor space requirements, as per Clause 3.2.8.2.(1)(b) and Sentences 3.2.8.2.(5) and (6), are limited to a building having only a two storey interconnected floor space.

The mall on its own, on the other hand, is described as a two storey structure with an interconnected floor space. However, no additional OBC interconnected floor space fire safety measures were provided in the mall because, as per Sentence 3.2.8.2.(6), these measures were not required in a building having only a two storey interconnected floor space.

3. **Dispute**

There are two issues at dispute between the Applicant and Respondent. The first is whether the proposed new arena built adjoining to the existing retail mall as one, albeit expanded, building

constructed on two properties complies with Articles 1.1.3.2. and 3.2.3.4. of the Ontario Building Code. The second is whether the building design with respect to the arena addition and the interface between the mall and arena, proposed without the provision of either a continuous 2 hour rated separation with closures to terminate the floor areas, or interconnected floor space fire safety measures, provides sufficiency of compliance with Sentence 3.2.8.1.(1) of the OBC.

The first dispute centres on the interpretation of Article 3.2.3.4., which states that "a party wall shall be constructed as a firewall." As described above, the proposed completed structure will straddle two properties and will not be separated by a firewall. At issue, therefore, is whether Article 3.2.3.4. requires a building straddling a property line to be separated by a firewall on that line.

The second dispute is whether the proposed design of the arena and the interface between the mall and the arena offered in lieu of either a 2 hour fire separation with closures between the structures or interconnected floor space fire safety measures achieves the same level of safety intended in the Sentence 3.2.8.1.(1). If the arena is considered a three storey building, then the exceptions to the interconnected floor space requirements found under Article 3.2.8.2. in general, and Sentence 3.2.8.2.(1), (2) and (6) in particular, no longer apply. This would mean that either the floors must terminate at vertical fire separations having a fire rating equal to the separation required in the floors and the openings must be installed with appropriate protective closures, or interconnected floor space fire safety measures must be provided. At issue then is whether the arena should be considered a 3 storey building and whether its design compensates for the lack of 2 hour vertical fire separations with closures, or interconnected floor space fire safety measures.

4. **Provisions of the Ontario Building Code**

Article 1.1.3.2.- Defined Terms

Firewall means a type of fire separation of noncombustible construction which subdivides a building or separates adjoining buildings to resist the spread of fire and which has a fire-resistance rating as prescribed in this Code and has structural stability to remain intact under fire conditions for the required fire-rated time.

Party wall means a wall jointly owned and jointly used by 2 parties under easement agreement or by right in law, and erected at or upon a line separating 2 parcels of land each of which is, or is capable of being, a separate real-estate entity.

Sentence 3.2.1.1.(2) - Exceptions in Determining Building Height

(2) Space under tiers of seats in a building of the arena type shall not be considered as adding to the building height provided the space is used only for dressing rooms, concession stands and similar purposed incidental to the major occupancy of the building.

Article 3.2.3.4. - Party Wall

(1) A party wall shall be constructed as a firewall.

Sentence 3.2.8.1. Application

(1) Except as permitted by Article 3.2.8.2. and Sentence 3.3.4.2.(3), the portions of a floor area or a mezzanine that do not determine at an exterior wall, a firewall or a vertical shaft shall:

(a) terminate at a vertical fire separation having a fire-resistance rating not less than that required for the floor assembly and extending from the floor assembly to the underside of the floor or roof assembly above, or;
(b) be protected in conformance with the requirements of Articles 3.2.8.3. to 3.2.8.11.

Sentences 3.2.8.2.(1),(5) and (6) Exceptions to Special Protection

(1) A mezzanine need not terminate at a vertical fire separation nor be protected in conformance with the requirements of Articles 3.2.8.3. to 3.2.8.11. provided the mezzanine (a) serves a Group A, Division 1 major occupancy,
(b) serves a Group A, Division 3 major occupancy in a building not more than 2 storeys in building height, or
(c) is not considered as a storey in Sentences 3.2.1.1.(3) or 3.2.1.1.(5) in calculating building height provided:

i. every point on the mezzanine is within 25 m (82 ft) of a point or points on the mezzanine perimeter from which, in the aggregate, an occupant may view 60% of the area of the room or storey in which the mezzanine is located, and
ii. the mezzanine does not contain a Group B occupancy,

(d) is not considered a storey in Sentence 3.2.1.1.(4) in calculating building height provided the mezzanine is not more than 500 m^2 (5,380 m^2) in area and does not contain a Group B

occupancy, or;
(e) is not considered a storey in calculating building height in Sentence 3.2.1.1.(8).

(5) Except as permitted by Sentence (6), openings for stairways, escalators and inclined moving walks need not conform to the requirements in Articles 3.2.8.3. to 3.2.3.11. provided;

(a) the opening for each stairway, escalator or walk does not exceed 10 m2 (108 ft2);
(b) the building is sprinklered throughout, and;
(c) the interconnected floor space contains only Group A, Division 1, 2 and 3, Group D or Group E occupancies.

(6) An interconnected floor space need not conform to the requirements of Articles 3.2.8.3. to 3.2.8.11. provided:

(a) the interconnected floor space consists of the first storey and the storey next above or below it, but not both;
(b) the interconnected floor space is sprinklered, and;
(c) the interconnected floor space contains only Group A, Division 1, 2 or 3, Group D, Group E, or Group F, Division 3 occupancies. (See Appendix A.)

5. **Applicant's Position**

The Applicant stated at the outset that there are two separate but related issues in dispute; the firewall and the interconnected floor space requirements. He indicated that he would present arguments of interpretation on the former and sufficiency of compliance on the latter.

On the first issue, the Applicant submitted that Sentence 3.2.3.4.(1) of the OBC does not mandate that a firewall be built on a property line. It merely states, he argued, that if a party wall is constructed, then it should be built as a firewall. The wording in the Code, especially the definition of party wall, does not indicate that a partywall is obligatory where a building straddles a property line. Moreover, this definition contains nothing which could be construed as preventing the owners of a building from erecting a single structure on both properties and managing it jointly. This is exactly their intention in the subject proposal, he noted.

To support this, the Applicant then presented a copy of a draft memorandum of agreement for joint building management of the subject mall and arena. He described how the building would be managed and maintained and how the various safety systems would be operated. As further

evidence, the Applicant submitted a previous BCC ruling that permitted a single building to straddle two properties because the parties had committed to "enter into an agreement with respect to the management, maintenance, and the conditions of future sale of either property."

The intent of the OBC, the Applicant argued, is to protect the occupants of a building and to limit property damage. If this has been achieved in a single building sitting on two properties, then the intent of the Code has been realized.

On the interconnected floor space issue, the Applicant argued that the proposed arena facility was not the type of structure to which Articles 3.2.8.3. to 3.2.8.11. were meant to apply. He discussed how these provisions were developed in the mid-1980s and that he was the chairman of the advisory committee that examined them. He presented extracts of minutes of committee meetings to support this position.

The Applicant also indicated that it was possible to view the completed building, including arena, as only a two storey structure. He asserted that the space under the seats, including the sports hall of fame corridor, did not have to be counted as a storey. In his view, a sports hall of fame could be seen as ancillary to the arena's main purpose. The Applicant did acknowledge, nonetheless, that the two levels of the mall and the two levels of the arena did not align with each other.

If the Commission found it difficult, however, to accept the arena and mall as anything less than a three storey structure, then the Applicant stated that it is also possible to demonstrate sufficiency of compliance with the relevant provisions of the OBC. And in terms of sufficiency of compliance, he indicated that if the building is considered three storeys and since they are not proposing to construct a two hour fire separation, complete with closures between the mall and the arena, then the interconnected floor space requirements found in Articles 3.2.8.3. to 3.2.8.11. would be applicable. It was with respect to these provisions that the Applicant stated that he would be arguing sufficiency of compliance.

By way of compensating measures to achieve sufficiency of compliance then, the Applicant stated that a principle factor to be considered was the large volume of space contained in the arena. He argued that in the event of a fire in such a large space, the arena would act as a "smoke sink" and would serve to dilute the smoke until well after the occupants had exited and the fire was under control. Obviously, the smoke dilution activity would most directly reduce the danger of a fire in the arena, but it would also help in the event of a fire in the mall. Nevertheless, in a noncombustible, sprinklered building, and considering the size of the overall structure and the

distances smoke would have to travel, it is unlikely that the mall and the arena would pose much danger to each other, he added.

The design of the building with respect to the interface between the mall and arena also provides a compensating measure to the interconnected floor space requirements. As he noted, the ground floor of the mall as it connects to the ice level of the arena at the sports hall of fame corridor is equipped with fire rated doors with closure devices. The corridor itself is separated from the arena by a two hour fire separation. As well, the third level of the arena is not connected to the mall. It is only where the concourse level of the arena joins the second storey of the mall that a penetration occurs. He argued, however, that much of the interface at this level is a two hour separation, with other portions being an unrated glazed separation. The only area not provided with a separation is the sliding glass panel security barrier and at 8 m^2, the Applicant described this as relatively minor considering the size of the complex.

Other compensating measures featured in the building include the more than adequate egress facilities and corresponding exit time, especially from the third level of the arena. He indicated that the exit time from this level would be in the order of the 3 to 3.5 minutes. As well, the building will be equipped with a two stage fire alarm system. A fire safety plan will also be developed for the entire building.

For these reasons, the Applicant summarized that the design of the building, especially at the interface between the mall and arena, provides sufficiency of compliance with Articles 3.2.8.3. to 3.2.8.11.

Lastly, the Applicant stated, in response to the Housing Development and Buildings Branch's Technical Background Information report, that it was not necessary to conduct an analysis of the proposed building under the NFPA 92B standard, "Guide for Smoke Management in Malls, Atria, and Large Areas". In his view, this would impose requirements on the building that would be in excess of the OBC. He argued that it makes different assumptions and is usually used for much larger buildings such as the Air Canada Centre and the Corel Centre.

6. **Respondent's Position**

On the firewall issue, the Respondent submitted that while the Code does not explicitly state that a firewall constructed as a party wall is required on a property line demarking two parcels of land, he argued that the Code assumes that one is to be built and it is therefore implicitly required. He indicated that a four hour firewall would be necessary and with this level of

protection it would protect both buildings from each other. He pointed out, however, that the current design proposes a separation with much of it having a zero hour rating, as well as including an 8 m^2 penetration. The separation does not even follow the line of severance.

The Respondent also asserted that building a firewall would have practical benefits for the Applicant, namely it would allow them to avoid the interconnected floor space requirements. Moreover, he explained that it was his view that the joint management agreement might be difficult to implement.

On the second issue, the Respondent stated that even if the arena is not considered a three storey structure on its own, because the levels of the mall and arena are offset as they connect to each other, the combined building must then be viewed as a three storey structure that has an interconnected floor space. Since the Applicant's design does not include a firewall, nor a continuous two hour separation between the mall and the arena, the requirements for interconnected floor space fire safety measures such as smoke control etc. found in Articles 3.2.8.3. to 3.2.8.11. must therefore apply. The Respondent noted that the current design of the facility has not proposed these measures.

Regarding the Applicant's argument that the design of the structure offers sufficiency of compliance with these provisions in the OBC, the Respondent indicated that he believed it was beyond his authority to make such an assessment.

7. **Commission Ruling**

It is the decision of the Building Code Commission that OBC Sentence 3.2.3.4.(1) is satisfied without the construction of a party wall on condition that the building is managed and operated as a single entity and that a single legal agreement dealing with the operation of the buildings and their respective fire and life safety systems is registered on title.

It is also the decision of the Building Code Commission that Articles 3.2.8.3. to 3.2.8.11. of the OBC have not been satisfied.

8. **Reasons**

(i) No compensating measures to prevent smoke migration and flame spread have been provided.

Dated at **Toronto** this **23rd** day in the month of **September** in the year **1999** for application number **1999-51**.

BCC Ruling No. 99-59-715

BUILDING CODE COMMISSION DECISION ON B.C.C. #99-59-715

IN THE MATTER OF Subsection 24 (1) of the *Building Code Act, 1992*.

AND IN THE MATTER OF Sentence 3.8.2.3.(1) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99 and 278/99 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Paul Pappas, owner, 1090302 Ontario Limited, Hamilton, Ontario, for the resolution of a dispute with Mr. Len C. King, Building Commissioner, City of Hamilton, Ontario, to determine whether the proposed change of use to a Group A, Division 2 (restaurant) occupancy, that is not provided with barrier-free a accessible washroom nor a separate washroom shared between employees only, is required to comply with Sentences 3.8.2.3.(1) and 3.7.4.3.(7) respectively of the Ontario Building Code at Smooth Herman's Bar and Grill, 109 George Street, Hamilton, Ontario.

DATE OF RULING

September 23rd, 1999

APPEARANCES

Mr. Paul Pappas, owner
1090302 Ontario Limited
Hamilton, Ontario
The Applicant

Mr. Willie Wong, Manager
Customer Services
Hamilton Building Department
Designate for the Respondent

RULING

1. The Applicant

Mr. Paul Pappas, owner, 1090302 Ontario Ltd., Hamilton, Ontario, has received a building permit under *the Building Code Act, 1992* to renovate an existing building and to convert it to bar/restaurant known as Smooth Herman's Bar and Grill, 109 George Street, Hamilton, Ontario.

2. Description of Construction

The Applicant proposes to renovate an existing Group D - (office) Business occupancy by converting it to a Group A, Division 2 - (bar/restaurant) Assembly use. The building is described as two storeys in building height, 255 m2 in building area, and is of combustible construction. The structure is a heritage building located in an historic area of downtown Hamilton known as Hess Village. The occupant load of the facility has been calculated at a maximum of 40 persons, which includes the staff of four.

The construction in dispute involves the provisions of washrooms in the renovated facility. Currently, the Applicant is proposing only two washrooms, one per sex, to serve both the patrons and the staff. A

barrier free washroom is not proposed, nor is a barrier free path of travel, including an entrance, being contemplated. Specifically at issue therefore is whether the two washrooms provided are required to be barrier free and whether a single, separate shared washroom for employees only is also required.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the proposed change of use to a Group A, Division 2 restaurant/bar occupancy, necessitates that a barrier free washroom be provided in accordance with Sentence 3.8.2.3.(1) of the Ontario Building Code and whether a separate washroom facility dedicated for employees only is required as per Sentence 3.7.4.3.(7).

The former provision stipulates that a barrier free washroom and a barrier free path of travel serving that washroom are required in buildings where a washroom is required under Subsection 3.7.4. The larger question at issue, however, is whether this existing building, as a result of its change of use, is required to become barrier free accessible in the first place. As a change of use with a renovation to an existing building that is older than five years Parts 10 and 11 of the OBC are applicable. The proposed change in building use and renovation are considered to reduce the performance level of the structure and therefore certain additional construction as per Parts 3 and 9 of the Code is required. Subsection 3.8, "Barrier-Free Design", however, is not among the areas with which compliance is needed as determined in Sentences 10.3.1.1.(1) and 11.4.3.4.(2).

The latter provision determines the appropriate number of washrooms that are required in this type of assembly occupancy. In this instance, with a 36 seat restaurant/bar plus four staff for a total occupant load of 40, the sharing of water closets between staff and patrons is permitted, but the number of lavatories must conform to Table 3.7.4.3.F. This Table mandates that two washrooms per sex are required in the subject establishment. Sentence 3.7.4.3.(8) is an exception to Sentence (7), however, in that cases where the total number of staff is less than five, employees of both sexes are allowed to share a single water closet if the facility has a door capable of locking from the inside. The Applicant is not proposing a third washroom.

4. Provisions of the Ontario Building Code

Sentence 3.8.2.3.Washrooms Required to be Barrier-Free

(1) Except where other barrier-free washrooms are provided on the same floor level within 45 mm (147 ft 8 in) and except within suites of residential occupancy, and buildings exempted in Clauses 3.8.1.1.(1)(a), (b) & (c), in buildings where a washroom in required in accordance with Subsection

3.7.4., a barrier-free path of travel shall be provided to a barrier-free washroom designed to accommodate disabled persons in conformance with the appropriate requirements in Articles 3.8.3.8. to 3.8.3.12.

Sentence 3.7.4.3.Plumbing Fixtures for Assembly Occupancies

(7) Except as provided in Sentence (8), in every dining room, restaurant, cafeteria and alcoholic beverage establishment having not more than 40 seats, patrons are permitted to share the sanitary facilities provided for employees, and the minimum number of water closets and lavatories shall conform to Table 3.7.4.3.F. based on

(a) a male occupant load of 50% of the number of seats plus the number of male employees, and
(b) a female occupant load of 50% of the number of seats plus the number of female employees.

5. Applicant's Position

The Applicant submitted that neither the barrier free accessibility nor the third washroom are required in his bar/restaurant. He argued that it was not his intention to renovate to create a barrier free path of travel, including widening the front entrance door and flattening its stoop, in his establishment. As a result, he did not see why a barrier free washroom would be required. He indicated that it was his understanding of the Building Code that barrier free requirements pertained to the construction of new buildings and not to limited renovations of existing, non-barrier free buildings like his. The Applicant stated that it was his belief that none of the barrier free requirements applied to his bar.

Regarding the issue of an extra washroom, the Applicant argued that Sentence 3.7.4.3.(4) was applicable. It refers to Table 3.7.4.3.D. which requires only one washroom per 20 persons of each sex, he noted. Thus, for his bar, with an occupant load of 40 only two water closets in total are required. He indicated that whereas other sentences in Article 3.7.4.3. specify regarding washrooms per number of seats or per employee, Table 3.7.4.3.D. simply refers to persons. This more general term could include both staff and patrons, he asserted.

Lastly, the Applicant argued that none of the other eight to ten restaurants in the area have been subjected to these requirements. He argued that the enforcement of the Building Code should be consistent.

6. Respondent's Position

The Respondent submitted that both the barrier free requirements and the additional washroom were mandatory. On the issue of barrier free requirements, he indicated that it was his belief that the change of use and work involved meant that the requirements of Section 3.8 were applicable. He also noted that the existing front door of the building was approximately 0.9 m in width and with additional minor modifications the facility could be made barrier free. As a result, he argued that the barrier free requirements are appropriate in this instance. Specifically, the Respondent argued that a barrier free path of travel (including the entrance), two barrier free seats and two barrier free washrooms should be provided.

Regarding the provision of a third washroom, the Respondent argued that Sentence 3.7.4.3.(4) and Table 3.7.4.3.D. only provided part of the total requirement in terms of the number of washrooms. It does not indicate how many washrooms should be included when considering staff as well. Sentences 3.7.4.3.(7) and (8) are more appropriate for the subject establishment, he stated, since they make allowances for a bar/restaurant with less than 40 seats and staff of five or fewer. In the Respondent's view, these sentences clearly require that an additional washroom for employees is required.

7. Commission Ruling

It is the decision of the Building Code Commission that it is not necessary to comply with the requirements of Sentence 3.8.2.3.(1) of the Ontario Building Code.

It is also the decision of the Building Code Commission that one additional washroom be provided for use of the staff as per OBC Sentence 3.7.4.3.(8) and that this washroom may be used by patrons in accordance with Sentence 3.7.4.3.(7).

8. Reasons

i) The existing building does not have a barrier free entrance and no renovations are proposed to alter the entrance.

ii) We have reviewed the partial plan (dated May 25, 1999) and the letter from Fabiani Architect Ltd. (dated September 23, 1999 - Exhibit 5a) and consider this information to be correct.

Dated at Toronto this 23rd day in the month of September in the year **1999** for application number **1999-38**.

RULING

1. **The Applicant**

   Mr. Christopher Boyd, Project Architect, Rebanks Architects Inc., Toronto, Ontario has received a building permit under the Building Code Act, 1992 to construct a new Loblaws Supermarket at 1048 Midland Avenue, Kingston, Ontario.

2. **Description of Construction**

   The Applicant is currently constructing a two storey, noncombustible structure with a building area of 7,504 m^2, that is classified as having a Group E - (retail) mercantile major occupancy. The building is considered to face one street for fire fighting purposes and is equipped with a sprinkler system and a fire alarm system, but not a standpipe and hose system.

   The roof assembly, as proposed by the Applicant, consists of Class A shingles and roofing felt nailed to 13 mm thick exterior grade fire-retardant treated plywood sheathing that are fastened to 18 gauge galvanized Z-shaped metal girts (spaced at 24 in. on centres) which are, in turn,

mounted on 38 mm thick fluted metal decking on steel framing. Below the plywood sheathing is to be a 25 mm air space below which will be found R19 fibreglass insulation sitting on top of 6 mm poly vapour barrier that rests directly on the metal decking. The majority of the proposed roof will be at an angle of approximately 30 degrees to the horizontal.

The construction in dispute involves the intended use of combustible plywood sheathing in the proposed roof assembly of a building that is required to be constructed of noncombustible construction.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the proposed roof assembly that includes fire-retardant treated plywood sheathing intended for a building that is required to be noncombustible according to Article 3.2.2.57. provides sufficiency of compliance with Sentences 3.1.5.3.(1) and (2) of the Ontario Building Code. Sentence (1) allows a combustible roof covering on a noncombustible building provided that the covering has an A, B or C classification as determined in conformance with CAN/ULC-S107-M87, "Standard Method of Fire Tests for Roof Coverings". The Applicant's proposed roof covering has an A classification. Sentence (2) allows a noncombustible roof under certain conditions if it is constructed above a concrete roof deck. The Applicant's proposed roof deck, however, is steel not concrete.

4. **Provisions of the Ontario Building Code**

Sentence 3.1.5.3.(1) and (2) Combustible Roofing Materials

(1) Combustible roof covering which has an A, B, or C classification determined in conformance with Subsection 3.1.15. Is permitted on a building required to be of noncombustible construction.

(2) Combustible roof sheathing and roof sheathing supports installed above a concrete deck are permitted on a building required to be of noncombustible construction provided

(a) the concrete deck is not less than 50 mm (2 in) thick,
(b) the height of the roof space above the deck is not more than 1,000 mm (3ft 3in),
(c) the roof space is divided into compartments by fire stops in conformance with Article 3.1.11.5.,
(d) openings through the concrete deck other than for noncombustible roof drains and plumbing

piping are protected by masonry or concrete shafts
(i) constructed as fire separations having a fire-resistance rating not less than 1 h, and
(ii) extending from the concrete deck to not less than 150 mm (5 7/8 in) above the adjacent roof sheathing,
(e) the perimeter of the roof is protected by a noncombustible parapet extending from the concrete deck to not less than 150 mm (5 7/8) above the adjacent sheathing, and
(f) exxcept as permitted by Clause (d), the roof space does not contain any building services.

5. **Applicant's Position**

The Applicant submitted that the proposed roof assembly which includes a fire-retardant plywood sheathing and fibreglass batt insulation provides an equivalent level of safety to that intended in the OBC. As he argued, Sentence 3.1.5.11.(5) and Clause 3.1.14.2.(2)(b) allow the use of foam plastic insulation above a roof deck if the building is sprinklered. In his view, the plywood sheathing is less hazardous than the permitted foam plastic insulation because it has been treated with a fire-retardant thereby giving it a maximum flame-spread rating of 25. Moreover, since the proposed air space in the assembly is small, at 25 mm or less, flames will not propagate throughout such a restricted space regardless of the flame-spread rating, the Applicant argued. He indicated that there were test results on wall assemblies to support this position.

As well, since the building is being sprinklered (which allows the roof assembly to be unrated) the resulting ceiling temperature of 295 degrees C combined with an ambient temperature of 22 degrees C for a total temperature of 317 degrees C allows the use of the foamed plastic insulation in the roof assembly. The same principle of sprinkler protection, the Applicant asserted, could also apply to the combustible plywood sheathing proposed for the roof assembly. As he argued, wood not treated with fire retardant protection has an ignition point of between 330 degrees C to 600 degrees C, but since this wood is treated it would not ignite until a much higher temperature. (The proposed plywood is treated throughout, not just surface coated.) In other words, in the event of a fire the sprinkler system would actuate and keep the temperature in the ceiling and roof areas low enough that the combustible elements there, specifically the plywood, would not ignite.

Another advantage of using plywood as a nailing surface instead of the permitted combustible cant strips is that it creates fewer voids in the roof assembly. Such wood strips, if used, also add significantly to the allowable combustible load in a roof assembly, the Applicant noted.

For these reasons, the Applicant argued that the proposed roof assembly provides sufficiency of compliance with Sentences 3.1.5.3.(1) and (2) of the OBC.

6. **Respondent's Position**

The Respondent submitted that the proposed use of combustible plywood, albeit treated with a fire-retardant, in a roof assembly of a building required to be of noncombustible construction does not provide sufficiency of compliance with Sentences 3.1.5.3.(1) and (2) of the OBC. He noted that Sentence 3.1.5.3.(2) specifically allows an exemption to this and permits a combustible roof sheathing under certain conditions. However, he indicated that in the case at hand these conditions were not being met.

The Respondent also noted that the wall assembly tests regarding the propagation of flame in the air space are not relevant because these tests were done on walls at 90 degrees to the horizontal, not at 30 degrees as is the proposed roof.

Lastly, the Respondent pointed out that the plywood is above the roof sprinkler system and is therefore unprotected from above.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the proposed roof assembly that includes fire-retardant plywood sheathing on Z-grits with a 25 mm air space and R19 fibreglass batt insulation mounted on a 38 mm metal decking provides sufficiency of compliance with Sentence 3.1.5.3.(1) and (2) of the Ontario Building Code at the Loblaws Supermarket, 1048 Midland Avenue, Kingston, Ontario.

8. **Reasons**

(i) Class A shingles will be used.

(ii) For Trent treated plywood, when the flame source is removed, the treated wood ceases to char and since it will not support combustion the flame will not spread.

(iii) The treated timber is considered equal or better than the permitted combustible nailing strips and foam insulation.

RULING

1. **The Applicant**

   Ms. Beth Northrup et al., property owners, Mississauga, Ontario have received a building permit under the *Building Code Act, 1992* to construct a detached, two storey house at 977 Meadow Wood Road, Mississauga, Ontario.

2. **Description of Construction**

   The Applicants are currently constructing a new detached, two storey, Group C - residential dwelling with a building area of 270 m^2 that is to be constructed of combustible material. The floor plan shows the house to be L-shaped. Common areas such as the kitchen, dining room,

living room, family room, library, greenhouse, etc. are to be located on the ground floor. The second floor will contain three separated sleeping areas, each with their own bathroom and each served by their own stairs. The house will also have a finished, partial basement containing a workroom, laundry room, wine cellar and storage space. The basement is to be located under the central area of the dwelling. The house is to be heated by hydronic heating installed in the floor assemblies in the basement, first and second floors. It will also be equipped with four heat recovery ventilators.

The foundation walls of the building, for both the excavated (the basement) and unexcavated areas, are to be made with durisol concrete blocks. The floors are to be poured concrete slabs. Over the basement area, the concrete floor slab will be supported on the durisol block foundation. For the other areas, the poured floors will be slabs on grade. The super-structure of the house is to be post and beam construction. The exterior walls on the ground floor will not be used to support any vertical loading from the structure. These walls are proposed to be constructed of straw bales covered with stucco and are the subject of these proceedings. The walls are designed merely to rest on the poured concrete slabs and act as "fill" between the post and beam structural members.

Specifically, the proposed wall assembly, as described in terms of a horizontal section from the exterior of the building to the interior, is to consist of three coats of cement stucco finish with a total thickness of 15 mm as the exterior cladding. The outermost coating, smoothed to finished texture, will be 3 mm in thickness, while the inner two layers are to be 6 mm each. The stucco is to be applied directly onto a floor to ceiling wire mesh with 25.8 cm^2 openings with a minimum weight of 0.98 kg/m^2 that will be stretched across compressed, stacked 460 mm thick straw bales. The innermost coating is to be embedded by pressure spray onto the mesh/straw fibre face. The wire mesh proposed to enclose the straw bales on their exterior and interior surfaces is to be held tight to the straw by tie wires placed between each course of bales 355mm high and every 915 mm horizontally.

The straw bales themselves are the dead stalks of cereal grain and are described as two-string bales having dimensions of approximately 460 mm wide by 915 mm long and 355 mm high. They are shown as having an RSI-value of 6.55. The wire mesh and three coats of stucco (spray, scratch and skim coats) are also found on the interior of the house, with the smooth last layer of stucco forming the finished wall. The interior wall surface, unlike the exterior, is to be treated (on the outer surface only) with a waterproof finish.

Described vertically, the wall assembly is built of 7 courses of straw bales laid overlapping in a flemish bond. The typical bale wall in the subject structure will be nearly 2.5 m in height. To provide lateral stability for the stacked bales, a system of wall stabilizers will be installed at the top (shown as the "top ladder") and bottom ("sill plate") of the proposed wall assemblies. These stabilizers consist of a pair of parallel pressure treated (bottom only) 2" by 6" boards laid flat and bolted to the concrete floor and ceiling assemblies running along the perimeter of the building. Running perpendicular between the 2" by 6" boards and spaced at 1.22 m on centre will be 2" by 6" wood cross pieces (thus making the top and bottom stabilizers resemble a ladder). (The voids created between the 2" by 6" members will be filled by 2" mineral fibre rigid insulation.) Attached to the top and bottom 2" by 6" stabilizers and spanning the full vertical height of the wall are to be 19 mm diameter bracing wires rated at 590 kg stress and spaced every 1.22 m. Additional lateral strength will be created by a series of 50 mm by 19 mm by 810 mm wood spikes that are to be driven through the middle of the bales. (Similar length bamboo shoots or re-bars may also be used as spikes.)

The construction details at the corners are similar to the typical proposed straw bale wall, except that they are provided with one additional stabilizing feature. At each corner of the structure, a custom bent 1.83 m long, 10 mm diameter reinforcing steel bar, will be placed in between each course of bale so that the bar extends equal amounts into both sections of the walls that form the corner. The corner reinforcement bars will then be secured to the lateral stability spikes.

As the walls are non-structural, the rough openings for the windows and doors are required to be framed in wood and connected at the top and bottom 2" by 6" wall stabilizers. Because the straw bale walls are to be approximately 510 mm thick, the wood framing provided for the doors and windows will be lined with 13 mm plywood to complete the rough openings. For both the headers and sills of the openings, the horizontal framing members run underneath and act to support the plywood. The spaces created between the plywood and the 2" by 6"s are to be insulated with mineral fibre batt insulation.

The electrical services provided in the straw walls will be channelled through noncombustible raceways set 38 mm into the bales. Electrical boxes are to be supported in the walls by fastening them to wooden wedges that will be driven into cavities cut out of the bales.

The exterior side of the straw bale walls will be protected from the elements, especially exposure to excessive moisture due to driving rain or snow, by two design features of the house. The first is the 0.9 m overhang of the roof, which will provide direct protection to the upper portion of the

straw bale walls (which are located on the ground floor only). The proposed roof design of the house is to resemble an english cottage with a thatched roof. It will slope at a 45^0 angle from horizontal and will extend in most areas to the upper portion of the ground floor. The second protective feature is a 710 mm high masonry veneer splash skirt comprised of 93 mm thick blocks capped by a precast coping sill provided around the base of the exterior of the bale walls and constructed directly upon the edge of the concrete block basement foundation wall.

The above described straw bale wall assembly is proposed for a total of roughly 70 % of the entire ground floor perimeter of the house. There is no straw bale wall system proposed anywhere on the second floor. In fact, the intended english cottage-style roof is to comprise most of the second floor walls. The little vertical wall that is found on the second floor is to be built with conventional wall assemblies using mineral wool insulation.

The construction in dispute involves the proposed straw bale wall system.

3. **Dispute**

The issue at dispute between the Applicant and Respondent is whether the proposed insulation system and wall assembly composed of compressed, stacked straw bales enclosed by metal lath covered on both sides with 15 mm cement stucco and coated (on the outer surface of the interior only) with a waterproof finish provides sufficiency of compliance with Sentences 9.25.2.1.(1), (2) and (4), Sentence 9.25.2.3.(1), Article 9.25.3.1., Article 9.25.4.1., Sentence 9.25.4.2.(5) and Articles 9.28.4.2. and 9.28.4.3. of the Ontario Building Code. There are four separate areas of dispute with respect to the proposed wall assembly.

The first involves the intended use of straw bales as the insulation material. Sentences 9.25.2.1.(1) and (2) in general require that insulation be provided between heated and unheated spaces and Sentence (4) requires the insulation valves to conform with Table 9.25.2.1. For the proposed structure, Table 9.25.2.1. requires the exterior straw bale wall system to be insulated with not less than RSI 3.00 insulation. While the RSI value of straw is generally accepted as high, it is often inconsistent in terms of density and therefore difficult to measure with exactness. Further, Sentence 9.25.2.3.(1) states that insulation shall conform to one of the standards listed. To date, straw has not been shown to meet any of the referenced standards.

Section 9.38 is an alternative to the insulation requirements of Section 9.25. There are no referenced standards listed in this Subsection, and as such any evaluation of the straw as an

acceptable insulation material must demonstrate an adequate level of performance to meet Code requirements.

The second dispute relates to the provision of an air barrier in the subject wall assembly. Article 9.25.3.1. stipulates that a thermally insulated wall assembly be provided with a continuous air barrier. This barrier is designed to prevent the passage of air from inside of the building to the exterior and vice versa. It can be placed anywhere in the wall assembly as long as its location does not cause increased moisture condensation in the wall cavity. The Applicant has not provided a typical sheet or panel type of air barrier. At dispute, therefore, is whether the applications, interior and exterior, of cement stucco act as an air barrier and thus provide sufficiency of compliance with Article 9.25.3.1.

Closely related to this issue is the third dispute; the requirement for a vapour barrier found in Article 9.25.4.1. Basically, this provision requires that a vapour barrier be included in a thermally insulated wall assembly. The vapour barrier must be on the warm side of the insulation to prevent the build up of condensation in the wall. The Applicant is proposing to apply, on the interior surface of the straw bale walls, a vapour barrier coating. Sentence 9.25.4.2.(5) of the Code permits such coatings to act as a vapour barrier if its permeance conforms to CAN/CGSB-1.501-M , "Method for Permeance of Coated Wallboard." This standard obviously pertains to coatings applied to gypsum board. The Applicant's wall will be constructed of cement stucco, not gypsum board.

The final issue is the proposed use of stucco as the wall sheathing. Article 9.28.4.2. permits the sheathing beneath stucco to be waived where certain galvanized wire (1.19 mm in diameter) applied horizontally to the framing at vertical intervals of 150 mm or less is used, or where paper-backed welded wire metal lath is installed as per Article 9.28.4.3. However, the Applicant is proposing to use a wire mesh on the interior and exterior wall faces tied together at vertical intervals of 355 mm, the height of the straw bales. Moreover, the proposed wire mesh is not paper-backed. As noted, the Applicant is proposing to apply the stucco directly to the straw face which will be enclosed on both the interior and exterior with wire mesh. At issue is whether the straw face is an appropriate backing for stucco application.

4. **Provisions of the Ontario Building Code**

Article 9.25.2.1. - Required Insulation

(1) All walls, ceilings and floors separating heated space from unheated space, the exterior air or the exterior soil shall be provided with sufficient thermal insulation to prevent moisture condensation on their room side during the winter and to ensure comfortable conditions for the occupants. (See A-9.1.1.1. in Appendix A.)

(2) Insulation shall be provided between heated and unheated spaces and between heated spaces and the exterior, and around the perimeter of concrete slabs-on-ground.

(4) Except as permitted in Sentences (5), (6), (7), (8), (13) and (14) the minimum thermal resistance of insulation shall conform to Table 9.25.2.1.

Article 9.25.2.3. - Insulation Materials

(1) Except as required in Sentence (2), thermal insulation shall conform to the requirements of:

(a) CAN/CGSB-51.20-M, "Thermal Insulation, Polystyrene, Boards and Pipe Covering";

(b) CGSB 51-GP-21M, "Thermal Insulation, Urethane and Isocyanuratem Unfaced";

(c) CAN/CGSB-51.23, "Spray Applied Rigid Polyurethane Cellular Plastic Thermal insulation";

(d) CAN/CGSB-51.25M, "Thermal Insulation, Phenolic, Faced";

(e) CAN/CGSB-51.26-M, "Thermal Insulation, Urethane and Isocyanurate, Board, Faced";

(f) CAN/CGSB-51-GP-27M, "Thermal Insulation, Polystyrene, Loose Fill";

(g) CGSB 51 -GP-60M, "Thermal Insulation, Cellulose Fibre, Loose Fill";

(h) CSA A101, "Thermal Insulation, Mineral Fibre, for Buildings"; or

(i) CAN/CSA-A247-M, "Insulating Fibreboard".

Article 9.25.3.1. - Required Barrier to Air Leakage

(1) Thermally insulated wall, ceiling and floor assemblies shall be constructed so as to include an air barrier system which will provide a continuous barrier to air leakage:
(a) from the interior of the building into wall, floor, attic or roof spaces sufficient to prevent

excessive moisture condensation in such spaces during the winter; and
(b) from the exterior inward sufficient to prevent moisture condensation on the room side during winter. (See Appendix A.)

Article 9.25.4.1. - Required Barrier to Vapour Diffusion

(1) Thermally insulated wall, ceiling and floor assemblies shall be constructed with a vapour shall be constructed with a vapour barrier sufficient to prevent condensation in the wall spaces, floor spaces or attic or roof spaces.

Article 9.25.4.2. - Vapour Barrier Materials

(5) Where a coating is applied to gypsum board to function as the vapour barrier, the permeance of the coating shall be determined in accordance with CAN/CGSB-1.501-M, "Method for Permeance of Coated Wallboard".

Article 9.28.4.2. - No Sheathing Required

(1) Sheathing need not be provided beneath stucco where not less than 1.19 mm (0.047 in) diam galvanized wire is applied horizontally to the framing at vertical intervals not exceeding 150 mm ($5^{7/8}$ in), or where paper-backed welded wire metal lath is used.

Article 9.28.4.3. - Stucco Lath Specifications

(1) Stucco lath shall conform to Table 9.28.4.3. (See Appendix A.)

5. **Applicant's Position**

The Agent for the Applicants indicated that in order to demonstrate the sufficiency of compliance of the proposed wall system, it would be necessary for him to deal with the relevant provisions of the OBC that pertain to a more conventional wall assembly. As a result, he stated that he would present arguments regarding the four identified areas of dispute; straw as insulation, lack of a conventional air barrier, a vapour barrier coating applied to cement stucco and straw as a backing for stucco.

On the issue of straw as insulation, the Agent noted that there are two principal aspects in so far as the Building Code is concerned. The first of these pertains to Sentence 9.25.2.3.(1) of the Code which requires insulation to meet one of the listed standards. He argued that the listed tests were all designed for manufactured, not natural, materials and as a result it would be difficult and perhaps inappropriate to test straw using the referenced criteria. He stated that under the Architectural Graphic Standards, however, non-manufactured materials have been recognized as insulation. As well, the ASHRAE standard, "1977 Fundamentals", lists RSI values for wood, wool, linen, cork, wood ash, saw dust and snow. The Agent noted that it was precisely because straw is a natural and chemical free insulation material that it was deemed suitable for his clients. His goal, he indicated, was to design a home with as clean an environment as possible.

With respect to the other aspect regarding straw as insulation, i.e., determining its RSI value, the Agent asserted that any house fitted with straw as the thermal barrier would not be under insulated. Straw is comprised of roughly 90 per cent air voids, he added, which is the essential idea behind insulation. He claimed that various tests have been conducted to determine the RSI value of straw and the results ranged from a low of RSI 3.00 to a high of RSI 8.82. In particular, tests conducted at the Oak Ridge National Labs and the Technical University of Nova Scotia on full-scale wall assemblies similar to those proposed were found to have RSI values in the range of 4.55 to 5.25. He indicated that they are using an RSI value of 6.55 to determine the Heat Loss Calculations. The Agent noted that Sentences 9.25.2.1.(1), (2) and (4) require only an RSI value of 3.00. This, he argued, was easily met by the proposed 460 mm thick straw bales.

The Agent did acknowledge that the RSI values of straw can be variable. The issue is one of density and the fact that straw bales because of the material itself and the way it is packed usually do not possess uniform consistency. This explains much of the wide range of RSI results, he stated. The minimum density of straw that he would consider using for the proposed house would be 113 kg/m^3, which is consistent with the minimum requirement used by most US codes that contain standards for straw as insulation. Nevertheless, the actual straw used will probably have a considerably higher density, he added.

Regarding the second and third issues, air barrier and vapour barrier, the Agent noted that they are interconnected. He stated that the requirements related to these two items reflect the Building Code's philosophy of preventing the movement of air and moisture through a wall assembly, i.e., the building should be sealed as tightly as possible. The philosophy of his wall assembly is different, however. It is based upon the view that the wall should be able to "breathe" to a degree in order to allow for the passage of moisture in and especially out of the wall cavity. In this light,

the Agent argued that adding an air barrier and vapour barrier would probably do more harm than good.

As a result, the Agent stated that their wall assembly, as proposed, will not contain an air barrier as envisaged under Article 9.25.3.1. of the OBC. While he acknowledged that an air barrier complying with the air leakage characteristics found in Article 9.25.3.2. would probably provide a greater degree of impermeability, he argued that cement stucco will also not allow for too much air movement. Being somewhat more porous, however, is a positive feature of cement stucco since the overall goal of the wall assembly is to allow some movement of moisture through vapour diffusion, while at the same time preventing as much air movement as possible.

In terms of whether cement stucco meets the prescriptive air leakage requirements, the Agent indicated that he was unaware of any available tests to indicate as such. By way of comparison though, he noted that cement board has been tested and has proved to provide quite a high level of impermeability. The Agent then added that in order to achieve a consistent air barrier as intended in the Code it is crucial to ensure that the caulking details are done right.

On the issue of the vapour barrier, the Agent indicated that the principle governing the design of the proposed wall assembly was not vapour tightness as intended in the OBC. Instead, limited moisture in the form of vapour will be allowed in and especially out of the wall. The Agent noted that the very nature of straw would allow for a significant amount of safe moisture storage in the assembly. This ability to safely store certain levels of moisture, he argued, acts as a vital buffer between the deposition and removal of moisture (wetting and drying) giving the wall assembly added time to achieve a safe moisture balance.

Nevertheless, the Agent stated that excessive vapour movement from the interior of the house into the wall would be prevented by a barrier in the form of a paint-applied coating to be provided on the outer surface of the interior wall. This coating, he submitted, will achieve a moderate permeability level of 300 ng/(Pa $\cdot$ s $\cdot$ m^2) and will thus meet the intent of the requirements of Sentence 9.25.4.1. of the OBC. He felt that applying this coating to stucco was not a problem. More importantly, however, he argued that applying such a coating is not inconsistent with the concept of a breathing wall. The exterior side of the wall due to its lack of a vapour barrier will have a higher degree of moisture movement by diffusion. Moreover, the vapour barrier coating will not prevent all moisture from moving in and out of the interior side of the wall, it will simply control too much from getting in. The Agent also noted that the four heat recovery ventilators will prevent too much moisture build up inside the house.

In terms of vapour originating from inside the straw bale wall, the Agent indicated that this will not be a problem. This is because the straw will be treated, which includes allowing it to dry for a period of at least a year, before it is used in the proposed wall assembly. Construction materials such as lumber and concrete block that are considered saturated will also be avoided or allowed to dry. Further, the Agent stated that he intends to take extreme care when constructing the straw bale walls to ensure that it does not get wet. (Allowing the straw to get wet during construction and not reducing its moisture content prior to installation are two significant contributors to past failures of straw walls, he noted.) Also, since straw is comprised of tubular stalks which, as noted, consist of 90 per cent air voids, it does not wick water very well and has poor capillary suction. This works to its advantage, the Agent argued, in that it will not draw water inwards towards the core of the straw bales. Like all cellulose material straw does absorb water, he noted, however, the moisture content can rise to 20 per cent before mould growth occurs.

While limited vapour movement will occur in the straw bale wall assembly, liquid moisture, especially in the form of driving rain or snow, on the other hand, will be discouraged as much as possible, the Agent submitted. To this end, the exterior of the house has been designed with certain features to reduce the exposure of the straw bale walls to the elements. The roof of the house projects 900 mm over the top of the subject walls, thereby providing a generous protective overhang, he argued. The base of the walls are also protected, he noted, by the 710 mm proposed masonry splash skirt. This skirt will protect the straw walls from excessive water penetration by providing a guard against rain splashing and drifting snow. The masonry skirt, he explained, is designed with run off spaces and a 25 mm air gap between it and the bale wall to keep the straw as dry as possible. Again, exceptional attention will be paid to caulking the openings, joints, corners, etc. on the interior and especially the exterior of the house.

Summarizing his arguments on issues two and three therefore, the Agent submitted that the intelligence of the straw bale wall is its simplicity - it basically contains only two materials; straw and stucco. But if forced to comply with Code standards for a typical wall assembly such as air and vapour barriers, the results could be dire. The goal of his wall system, and in fact much of the design of his house, is to minimize wetting and maximize drying. Minimizing the wetting of the wall assembly will be achieved by the interior vapour barrier coating and the heat recovery ventilators and by the exterior design features, the roof overhang and masonry splash skirt. Maximizing drying will occur through the lack of a corresponding vapour barrier coating on the exterior side of the wall, and the fact that the cement stucco used has a higher level of permeability than traditional barriers (200 to 480 ng/(Pa · s ·m^2) and 400 to 800 ng/(Pa · s · m^2) if the stucco mix includes lime) to allow for moisture movement by diffusion. By providing the

proposed combination of design features and wall assembly elements, the Agent argued that a vital balance between wetting and drying has been achieved. By adding or taking away from the combination proposed, the delicate balance of the wall assembly would be threatened.

The final issue in dispute is the appropriateness of straw as a backing for cement stucco. On this point the Agent argued that the attachment of stucco directly to straw is not a problem. The irregularity of the sides of the straw bales provides quite a course mounting surface to allow a strong bond between the fibre face of the straw and the stucco to occur. He noted that the wire mesh to be used to encase both sides of the straw bales is galvanized and complies with Sentence 9.28.4.3.(1), however, he acknowledged that it was not possible to meet the requirements related to the fastening of the wire mesh to the framing, nor will the wire mesh be paper-backed. Nevertheless, the Agent indicated that the inclusion of the proposed wire ties that join the interior and exterior wire meshes together was not necessary for the present non-structural straw bale house, but in doing so met the construction standards for straw bale houses in jurisdictions that are earthquake prone.

The Agent further argued that the proposed stucco clad on the straw bales would provide a level of performance similar to the properties of sheathing required under the OBC. He noted that as with plywood that is fastened to wood studs, the cement stucco applied to the straw is not required to bear any weight and needs only to provide a certain degree of lateral strength. He indicated that cement stucco used in such a way, with wire mesh and applied to straw, would provide more than an adequate degree of stiffness. As a result, he submitted that the proposed stucco cladding attached to straw meets the intent of the sheathing requirements and thereby provides sufficiency of compliance with Article 9.28.4.2.

In conclusion, the Agent explained that it was not his intention to use straw as a way to cut costs. Rather, the use of straw is to allow for the construction of a house of natural materials. Only by doing so will they be able to create as healthy an environment as possible.

Finally, the Agent stated that straw was gaining wider use as a construction material. He submitted a list of seven jurisdictions in Ontario that had previously allowed the use of straw bale in various buildings. He noted that this was only a partial list and that to his knowledge at least 50 building have been constructed in Ontario with straw as one of the materials. Properly treated and installed, straw is a viable construction material, the Agent indicated.

6. **Respondent's Position**

The Respondent submitted that the OBC does not address houses built with straw. They undertook to learn as much about as possible about straw as a construction material in order to assess the project under Section 2.7 "Equivalents" of the Building Code. Nevertheless, they felt it was still not possible to accept the proposal. In their view, there were too many unanswered questions.

In terms of the specific disputes, the Respondent indicated that he would discuss the matters point by point.

Regarding the use of straw as insulation, he noted that they are unsure if straw has been tested according to any of the listed standards in Sentence 9.25.2.3.(1). He indicated that no proof of conformance was offered. In terms of RSI value, the Respondent stated that they do not dispute that the thermal resistance of straw is high. Because of its inconsistency as a material and its consequent variable test results, however, he argued that it is difficult to assess the true RSI value, which, in turn, makes approving a heating system problematic. He suggested that tests be performed by a recognized testing agency in order to determine a more precise RSI value for straw as a insulation material.

On the issue of the air barrier, the Respondent noted that Article 9.25.3.1. requires a continuous air barrier for walls that are provided with thermal insulation. Sentence 9.25.3.2.(1) provides the performance standards required of the air barrier. He indicated that they are unsure how the proposed system provides an air barrier as intended in the OBC and how the straw bale wall will achieve the required performance level.

Their view on the vapour barrier was similar. One is required in thermally insulated walls according to Article 9.25.4.1. The vapour barrier proposed, a paint-applied coating, the Respondent argued, is intended to be used on wallboard. They are unsure how it will perform when coated on stucco and if it will meet the OBC requirements of a vapour barrier.

With respect to the last issue, the Respondent indicated that the exceptions found in Article 9.28.4.2. that permit the sheathing beneath stucco to be waived have not been met in the proposed wire mesh reinforcement system. As a result, their position is that a paper-backed metal lath system conforming to Sentence 9.28.4.3.(1) be used to provide rigidity to the wall in lieu of a recognized sheathing material.

The Respondent concluded by stating that they did not want to prevent the Applicants from building their proposed house. However, they felt the Code offered them little flexibility in terms of accepting such a unique application. Nonetheless, they felt that the hearing has been a learning process for them and that it has increased their knowledge of the proposal, which, in turn, has increased their comfort level regarding the use of straw as a construction material.

7. **Commission Ruling**

It is the decision of the Building Code Commission that the proposed non-structural insulated wall assembly composed of compressed, stacked straw bales enclosed by metal lath and covered on both sides with a 15 mm layer of cement stucco and coated (on the interior surface of the inside only) with a waterproof finish provides sufficiency of compliance with Sentences 9.25.2.1.(1), (2) and (4), Sentence 9.25.2.3.(1), Article 9.25.3.1., Article 9.25.4.1., Sentence 9.25.4.2.(5) and Articles 9.28.4.2. and 9.28.4.3. on condition:

i. That the appointed independent consultant who is a recognized building science expert and a registered professional engineer in the Province of Ontario and that the architect of the project who is a registered professional architect in the Province of Ontario provide their professional stamps on the architectural drawings and details provided to the municipality;
ii. That the independent consultant ensure that the recommendations regarding straw bale construction contained in his report to the Commission are adhered to in the subject building;
iii. That the independent consultant review and approve the as constructed building and submit written confirmation of same with the municipality;
iv. That the proposed straw bale wall assembly be used on the ground floor only of the subject dwelling;
v. That the proposed straw bale wall assembly be used in a non-structural situation only;
vi. That the proposed straw bale wall assembly be constructed with a system of horizontal stabilizers consisting of a top ladder and bottom sill plate connected together with a series of pretension vertical tie down wires;
vii. That the proposed straw bale wall assembly be further constructed with angled re-bars laid flat on each course of bales at the dwelling's corners and that a series of spikes,

having a length of more than twice the height of the bales used, be driven vertically downward into the bale courses;

viii. That the proposed straw bale wall assembly be further constructed with wire mesh installed on both the interior and exterior surface of the straw that spans from top to bottom of the wall and which are fastened to the top ladder and the bottom sill plate and that both wire meshes are tied together by a series of tie backs running horizontally through the straw;

ix. That the window and door units in the proposed straw bale wall assembly be supported with wooden framing members that are attached to the top ladder and bottom sill plate;

x. That the proposed straw intended for use in this dwelling consist of prestressed, two-string bales with a minimum density of 113 kg/m^3 and a minimum RSI value of 3.00 (for Zone 1);

xi. That the proposed straw be treated and dried prior to installation in the subject dwelling and that it be kept dry at all times during construction;

xii. That the proposed dwelling be constructed with a roof projecting 900 mm over the walls of the subject house; and

xiii. That the proposed dwelling be constructed with a 710 mm high masonry splash skirt surrounding the ground floor perimeter of the house and attached to the subject straw and stucco wall assemblies.

8. **Reasons**

With conformance to the above conditions, the Commission is satisfied that the proposed wall assembly will be properly designed by a licenced architect and reviewed, inspected and approved by a certified engineer expertly qualified in this field, that the wall assembly will be used in the appropriate circumstances for the subject house, that the wall assembly will be constructed with adequate vertical and lateral support, that the walls be sufficiently air tight and vapour permeable as required in engineer's report, that the straw will be appropriately treated and handled before and during construction, and that the house itself will be designed to protect the exterior walls from excessive exposure to moisture.

Dated at **Toronto** this **7th** day in the month of **October** in the year **1999** for application number **1999-46**.

BCC Ruling No. 99-55-711

BUILDING CODE COMMISSION DECISION ON B.C.C. #99-55-711

IN THE MATTER OF Subsection 24 (1) of the *Building Code Act, 1992*.

AND IN THE MATTER OF Sentences 8.7.4.2.(8) and 8.8.1.2.(1) of Regulation 403, as amended by O. Reg. 22/98, 102/98, 122/98, 152/99 and 278/99 (the "Ontario Building Code").

AND IN THE MATTER OF an application by Mr. Nazzareno D'Angelo, property owner, Concord, Ontario, for the resolution of a dispute with Mr. Tom Reddering, Designated Sewage Inspector, Haliburton, Kawartha, Pine Ridge District Health Unit, Ontario to determine whether the Class 4 sewage system filter bed and mantle proposed to be sited in an area with 1:3 slope provides sufficiency of compliance with Sentence 8.7.4.2.(8), of the Ontario Building Code (OBC) or whether a Class 5 holding tank may be installed when considering Sentence 8.8.1.2.(1) of the OBC at Lot 131, Percy Lake, Harburn Township, Ontario.

APPLICANT

Mr. Nazzareno D'Angelo
Property Owner
Concord, Ontario

RESPONDENT

Mr. Tom Reddering

APPEARANCES

Mr. Thomas Grace, Principal, Grace and Associates
Lindsay, Ontario
For the Applicant

Mr. Tom Reddering, Designated Sewage Inspector
Haliburton, Kawartha, Pine Ridge District Health Unit
The Respondent

RULING

1. The Applicant

Mr. Nazzareno D'Angelo, property owner, has applied for a building permit under the *Building Code Act, 1992* to construct either a Class 4 or Class 5 sewage system to serve a seasonal residential dwelling at Lot 131, Percy Lake, Harburn Township, Ontario.

2. Description of Construction

The Applicant is proposing to install either a new Class 4 or Class 5 sewage system to serve a single detached Group C - (seasonal) residential dwelling. The proposed dwelling will contain three bedrooms, 17.5 fixture units and will have a total finished floor area of 111.5 m^2 . The calculated total daily design flow rate will be 1,600 Litres per day.

The Applicant has two sewage system proposals. Option one is a Class 4 system. This proposed system consists of a 3,600 L septic tank which would transmit effluent by gravity disposal to a 1,365 L pump chamber. From there the effluent would be pumped uphill to the filter bed located at the western edge of the lot near the road. The filter bed is to have a minimum contact area of 22.5 m^2 . Two pairs of three distribution lines in the filter bed are to extend in opposite directions horizontally across the slope from a

centre feed distribution box. In order to achieve a relatively level area, extensive engineered regrading of the site is necessary. The required 15 m mantle, proposed to be located directly downhill from the filter bed, would be terraced and supported with retaining walls where necessary. The entire area for which this option is proposed would have an average slope of 1:3.

Option two is a Class 5 holding tank sewage system. The system would consist of a 1,360 L pump chamber equipped with a sewage ejector pump that would pump the effluent uphill to the proposed holding tank, which would also be located at the western edge of the property. At 11,200 L, the tank would accommodate a seven day holding capacity. The proposed tank would also be equipped with an audible and visual alarm activated by a float switch. Some regrading of the site, especially in the area of the holding tank, would also be necessary to install this system.

The lot is described as steeply sloping (ranging from 1:1.8 to 1:3) to the lake, mostly covered with mature trees and is wedge-shaped measuring approximately 76 m in length by 45 m at the road (to the north) and 25 m at the lake (at the south), for a total approximate area of 0.35 ha. The depth of the soil averages roughly 0.6 m. The native soil has a percolation rate of 12 minutes per centimetre.

The water supply to the site will be drawn from the lake.

The construction in dispute involves the installation of either of these two systems on a 1:3 slope.

3. Dispute

The issue at dispute between the Applicant and Respondent is whether the Class 4 sewage system filter bed and mantle proposed to be sited in an area with 1:3 slope provides sufficiency of compliance with Sentence 8.7.4.2.(8) of the Ontario Building Code (OBC) or whether a Class 5 holding tank may be installed when considering Sentence 8.8.1.2.(1) of the OBC. Sentence 8.7.4.2.(8) requires that any fill added to a leaching bed must be sloped not steeper than a ratio of 1:4. The average slope on the Applicant's property is 1:2.5 and his Class 4 proposal (option one) would be situated on land regraded to a 1:3 slope. The conditions setting out when the installation of a holding tank is acceptable are regulated in Sentence 8.8.1.2.(1). None of the described conditions pertain to the Applicant's site. Further, steeply sloping property is not one of the criteria listed as grounds to qualify for a holding tank.

4. Provisions of the Ontario Building Code

Sentence 8.7.4.2.(8) Construction Requirements

(8) The sides of the added leaching bed fill shall be sloped to ensure stability, but shall not be steeper than 1 unit vertically to four units horizontally.

Sentence 8.8.1.2.(1) Acceptable Installation

(1) A Class 5 sewage system may be installed in the following circumstances:

(a) where the proposed use of the sewage system is for a temporary operation, excluding seasonal recreation use, not exceeding 12 months in duration,
(b) to permit the extension of an existing single-family dwelling provided that,

(i) the extension will not increase the wastewater load, and
(ii) the building is already served by a Class 5 sewage system,
(c) to remedy an unsafe sewage system where the remediation of the unsafe condition by the installation of a Class 4 sewage system is impracticable,
(d) to upgrade a sewage system on an existing lot or parcel of land, where upgrading through the use of a Class 4 sewage system is not possible due to lot size or clearance limitations, or
(e) as an interim measure for a lot or parcel of land until municipal sewers are available, provided that the municipality undertakes to ensure the continued operation of an approved hauled sewage system until the municipal sewers are available.

5. Applicant's Position

At the outset, the Applicant acknowledged that there were serious difficulties facing both of their proposals.

By way of background, the Applicant stated that the subject property was created through a severance in 1989, at which time it had been approved by the municipality and the HKPR District Health Unit as a building lot. The current owner bought the site in 1998 under the impression that the property could be developed. However, during the Applicant's attempts to apply for a building permit it was subsequently determined that a Class 4 sewage system would be very expensive to install due to the massive re-engineering of the site required and even then would not likely meet the slope restrictions regarding the sides of the imported leaching bed fill.

While the Applicant offered that they recognized the site constraints relating to the steep slope, he asked the Commission to consider their Class 4 proposal with some leniency, especially since they have relatively few alternatives.
